 - For **Metadata version**, select **V2 (token required)**.

For more information, see [Step 3: Configure Instance Details](#).

AWS CLI

To require the use of IMDSv2 on a new instance

The following [run-instances](#) example launches a c6i.large instance with `--metadata-options` set to `HttpTokens=required`. When you specify a value for `HttpTokens`, you must also set `HttpEndpoint` to `enabled`. Because the secure token header is set to `required` for metadata retrieval requests, this requires the instance to use IMDSv2 when requesting instance metadata.

```
aws ec2 run-instances \
```

```
--image-id ami-0abcdef1234567890 \
--instance-type c6i.large \
...
--metadata-options "HttpEndpoint=enabled,HttpTokens=required"
```

PowerShell

To require the use of IMDSv2 on a new instance

The following [New-EC2Instance](#) Cmdlet example launches a *c6i.large* instance with `MetadataOptions_HttpEndpoint` set to enabled and the `MetadataOptions_HttpTokens` parameter to required. When you specify a value for `HttpTokens`, you must also set `HttpEndpoint` to enabled. Because the secure token header is set to required for metadata retrieval requests, this requires the instance to use IMDSv2 when requesting instance metadata.

```
New-EC2Instance
-ImageId ami-0abcdef1234567890
-InstanceType c6i.large
-MetadataOptions_HttpEndpoint enabled
-MetadataOptions_HttpTokens required
```

AWS CloudFormation

To specify the metadata options for an instance using AWS CloudFormation, see the [AWS::EC2::LaunchTemplate MetadataOptions](#) property in the *AWS CloudFormation User Guide*.

Configure the AMI

When you register a new AMI or modify an existing AMI, you can set the `imds-support` parameter to `v2.0`. Instances launched from this AMI will have **Metadata version** set to **V2 only (token required)** (console) or `HttpTokens` set to `required` (AWS CLI). With these settings, the instance requires that IMDSv2 is used when requesting instance metadata.

Note that when you set `imds-support` to `v2.0`, instances launched from this AMI will also have **Metadata response hop limit** (console) or `http-put-response-hop-limit` (AWS CLI) set to `2`.

⚠ Important

Do not use this parameter unless your AMI software supports IMDSv2. After you set the value to `v2.0`, you can't undo it. The only way to "reset" your AMI is to create a new AMI from the underlying snapshot.

To configure a new AMI for IMDSv2

Use one of the following methods to configure a new AMI IMDSv2.

AWS CLI

The following [register-image](#) example registers an AMI using the specified snapshot of an EBS root volume as device `/dev/xvda`. Specify `v2.0` for the `imds-support` parameter so that instances launched from this AMI will require that IMDSv2 is used when requesting instance metadata.

```
aws ec2 register-image \
  --name my-image \
  --root-device-name /dev/xvda \
  --block-device-mappings DeviceName=/dev/
xvda,Ebs={SnapshotId=snap-0123456789example} \
  --architecture x86_64 \
  --imds-support v2.0
```

PowerShell

The following [Register-EC2Image](#) Cmdlet example registers an AMI using the specified snapshot of an EBS root volume as device `/dev/xvda`. Specify `v2.0` for the `ImdsSupport` parameter so that instances launched from this AMI will require that IMDSv2 is used when requesting instance metadata.

```
Import-Module AWS.Tools.EC2 # Required for Amazon.EC2.Model object creation.
Register-EC2Image ` 
  -Name 'my-image' ` 
  -RootDeviceName /dev/xvda ` 
  -BlockDeviceMapping ( ` 
    New-Object ` 
      -TypeName Amazon.EC2.Model.BlockDeviceMapping ` 
      -Property @{
```

```
DeviceName = '/dev/xvda';
EBS        = (New-Object -TypeName Amazon.EC2.Model.EbsBlockDevice -Property
@{
    SnapshotId = 'snap-0123456789example';
    VolumeType = 'gp3'
} )
} ) `
-Architecture X86_64 `
-ImdsSupport v2.0
```

To configure an existing AMI for IMDSv2

Use one of the following methods to configure an existing AMI for IMDSv2.

AWS CLI

The following [modify-image-attribute](#) example modifies an existing AMI for IMDSv2 only. Specify v2.0 for the imds-support parameter so that instances launched from this AMI will require that IMDSv2 is used when requesting instance metadata.

```
aws ec2 modify-image-attribute \
--image-id ami-0123456789example \
--imds-support v2.0
```

PowerShell

The following [Edit-EC2ImageAttribute](#) Cmdlet example modifies an existing AMI for IMDSv2 only. Specify v2.0 for the imds-support parameter so that instances launched from this AMI will require that IMDSv2 is used when requesting instance metadata.

```
Edit-EC2ImageAttribute ` 
-ImageId ami-0abcdef1234567890 ` 
-ImdsSupport 'v2.0'
```

Use an IAM policy

You can create an IAM policy that prevents users from launching new instances unless they require IMDSv2 on the new instance.

To enforce the use of IMDSv2 on all new instances by using an IAM policy

To ensure that users can only launch instances that require the use of IMDSv2 when requesting instance metadata, you can specify that the condition to require IMDSv2 must be met before an instance can be launched. For the example IAM policy, see [Work with instance metadata](#).

Configure IPv4 and IPv6 endpoints

By default, the IPv6 endpoint is disabled. This is true even if you are launching an instance into an IPv6-only subnet. You can choose to enable the IPv6 endpoint when you launch an instance.

The IPv6 endpoint for the IMDS is only accessible on [instances built on the AWS Nitro System](#).

Use one of the following methods to launch an instance with the IPv6 endpoint enabled for IMDS.

New console

To enable the IMDS IPv6 endpoint at launch

- [Launch the instance](#) in the Amazon EC2 console with the following specified under **Advanced details**:
 - For **Metadata transport**, choose **Enabled**.

For more information, see [Advanced details](#).

AWS CLI

The following [run-instances](#) example launches a *c6i.large* instance with the IPv6 endpoint enabled for the IMDS. To enable the IPv6 endpoint, for the `--metadata-options` parameter, specify `HttpProtocolIpv6=enabled`. When you specify a value for `HttpProtocolIpv6`, you must also set `HttpEndpoint` to `enabled`.

```
aws ec2 run-instances \
--image-id ami-0abcdef1234567890 \
--instance-type c6i.large \
...
--metadata-options "HttpEndpoint=enabled,HttpProtocolIpv6=enabled"
```

PowerShell

The following [New-EC2Instance](#) Cmdlet example launches a *c6i.large* instance with the IPv6 endpoint enabled for the IMDS. To enable the IPv6 endpoint,

specify `MetadataOptions_HttpProtocolIpv6` as enabled. When you specify a value for `MetadataOptions_HttpProtocolIpv6`, you must also set `MetadataOptions_HttpEndpoint` to enabled.

```
New-EC2Instance  
  -ImageId ami-0abcdef1234567890  
  -InstanceType c6i.large  
  -MetadataOptions_HttpEndpoint enabled  
  -MetadataOptions_HttpProtocolIpv6 enabled
```

Turn off access to instance metadata

You can turn off access to the instance metadata by disabling the IMDS when you launch an instance. You can turn on access later by re-enabling the IMDS. For more information, see [Turn on access to instance metadata](#).

Important

You can choose to disable the IMDS at launch or after launch. If you disable the IMDS *at launch*, the following might not work:

- You might not have SSH access to your instance. The `public-keys/0/openssh-key`, which is your instance's public SSH key, will not be accessible because the key is normally provided and accessed from EC2 instance metadata.
- EC2 user data will not be available and will not run at instance start. EC2 user data is hosted on the IMDS. If you disable the IMDS, you effectively turn off access to user data.

To access this functionality, you can re-enable the IMDS after launch.

New console

To turn off access to instance metadata at launch

- [Launch the instance](#) in the Amazon EC2 console with the following specified under **Advanced details**:
 - For **Metadata accessible**, choose **Disabled**.

For more information, see [Advanced details](#).

Old console

To turn off access to instance metadata at launch

- Launch the instance in the Amazon EC2 console with the following option selected on the **Configure Instance Details** page:
 - Under **Advanced Details**, for **Metadata accessible**, select **Disabled**.

For more information, see [Step 3: Configure Instance Details](#).

AWS CLI

To turn off access to instance metadata at launch at launch

Launch the instance with `--metadata-options` set to `HttpEndpoint=disabled`.

```
aws ec2 run-instances \
  --image-id ami-0abcdef1234567890 \
  --instance-type c6i.large \
  ...
  --metadata-options "HttpEndpoint=disabled"
```

PowerShell

To turn off access to instance metadata at launch at launch

The following [New-EC2Instance](#) Cmdlet example launches an instance with `MetadataOptions_HttpEndpoint` set to disabled.

```
New-EC2Instance ` 
  -ImageId ami-0abcdef1234567890 ` 
  -InstanceType c6i.large ` 
  -MetadataOptions_HttpEndpoint disabled
```

AWS CloudFormation

To specify the metadata options for an instance using AWS CloudFormation, see the [AWS::EC2::LaunchTemplate MetadataOptions](#) property in the *AWS CloudFormation User Guide*.

Modify instance metadata options for existing instances

You can modify the instance metadata options for existing instances.

You can also create an IAM policy that prevents users from modifying the instance metadata options on existing instances. To control which users can modify the instance metadata options, specify a policy that prevents all users other than users with a specified role to use the [ModifyInstanceMetadataOptions](#) API. For the example IAM policy, see [Work with instance metadata](#).

Query instance metadata options for existing instances

You can query the instance metadata options for your existing instances by using one of the following methods.

Console

To query the instance metadata options for an existing instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance.
4. Choose **Actions, Instance settings, Modify instance metadata options**.
5. Review the current instance metadata options in the **Modify instance metadata options** dialog box.

AWS CLI

To query the instance metadata options for an existing instance using the AWS CLI

Use the [describe-instances](#) CLI command.

```
aws ec2 describe-instances \
--instance-id i-1234567898abcdef0 \
--query 'Reservations[].Instances[].MetadataOptions'
```

PowerShell

To query the instance metadata options for an existing instance using the Tools for PowerShell

Use the [Get-EC2Instance](#) Cmdlet.

```
(Get-EC2Instance ` 
-InstanceId i-1234567898abcdef0).Instances.MetadataOptions
```

Require the use of IMDSv2

Use one of the following methods to modify the instance metadata options on an existing instance to require that IMDSv2 is used when requesting instance metadata. When IMDSv2 is required, IMDSv1 cannot be used.

Console

To require the use of IMDSv2 on an existing instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance.
4. Choose **Actions, Instance settings, Modify instance metadata options**.
5. In the **Modify instance metadata options** dialog box, do the following:
 - a. For **Instance metadata service**, select **Enable**.
 - b. For **IMDSv2**, choose **Required**.
 - c. Choose **Save**.

AWS CLI

To require the use of IMDSv2 on an existing instance

Use the [modify-instance-metadata-options](#) CLI command and set the `http-tokens` parameter to `required`. When you specify a value for `http-tokens`, you must also set `http-endpoint` to `enabled`.

```
aws ec2 modify-instance-metadata-options \
--instance-id i-1234567898abcdef0 \
--http-tokens required \
--http-endpoint enabled
```

PowerShell

To require the use of IMDSv2 on an existing instance

Use the [Edit-EC2InstanceMetadataOption](#) Cmdlet and set the `HttpTokens` parameter to `required`. When you specify a value for `HttpTokens`, you must also set `HttpEndpoint` to `enabled`.

```
(Edit-EC2InstanceMetadataOption ` 
    -InstanceId i-1234567898abcdef0 ` 
    -HttpTokens required ` 
    -HttpEndpoint enabled).InstanceMetadataOptions
```

Restore the use of IMDSv1

When IMDSv2 is required, IMDSv1 will not work when requesting instance metadata. When IMDSv2 is optional, then both IMDSv2 and IMDSv1 will work. Therefore, to restore IMDSv1, make IMDSv2 optional by using one of the following methods.

Console

To restore the use of IMDSv1 on an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance.
4. Choose **Actions, Instance settings, Modify instance metadata options**.
5. In the **Modify instance metadata options** dialog box, do the following:
 - a. For **Instance metadata service**, make sure that **Enable** is selected.
 - b. For **IMDSv2**, choose **Optional**.
 - c. Choose **Save**.

AWS CLI

To restore the use of IMDSv1 on an instance

You can use the [modify-instance-metadata-options](#) CLI command with `http-tokens` set to `optional` to restore the use of IMDSv1 when requesting instance metadata.

```
aws ec2 modify-instance-metadata-options \
--instance-id i-1234567898abcdef0 \
--http-tokens optional \
--http-endpoint enabled
```

PowerShell

To restore the use of IMDSv1 on an instance

You can use the [Edit-EC2InstanceMetadataOption](#) Cmdlet with `HttpTokens` set to `optional` to restore the use of IMDSv1 when requesting instance metadata.

```
(Edit-EC2InstanceMetadataOption `
-InstanceId i-1234567898abcdef0 `
-HttpTokens optional `
-HttpEndpoint enabled).InstanceMetadataOptions
```

Change the PUT response hop limit

For existing instances, you can change the settings of the PUT response hop limit.

Currently only the AWS CLI and AWS SDKs support changing the PUT response hop limit.

AWS CLI

To change the PUT response hop limit

Use the [modify-instance-metadata-options](#) CLI command and set the `http-put-response-hop-limit` parameter to the required number of hops. In the following example, the hop limit is set to 3. Note that when specifying a value for `http-put-response-hop-limit`, you must also set `http-endpoint` to `enabled`.

```
aws ec2 modify-instance-metadata-options \
--instance-id i-1234567898abcdef0 \
--http-put-response-hop-limit 3 \
--http-endpoint enabled
```

PowerShell

To change the PUT response hop limit

Use the [Edit-EC2InstanceMetadataOption](#) Cmdlet and set the `HttpPutResponseHopLimit` parameter to the required number of hops. In the following example, the hop limit is set to 3. Note that when specifying a value for `HttpPutResponseHopLimit`, you must also set `HttpEndpoint` to enabled.

```
(Edit-EC2InstanceMetadataOption ` 
    -InstanceId i-1234567898abcdef0 ` 
    -HttpPutResponseHopLimit 3 ` 
    -HttpEndpoint enabled).InstanceMetadataOptions
```

Enable the IPv6 endpoint for your instance

By default, the IPv6 endpoint is disabled. This is true even if you have launched an instance into an IPv6-only subnet. The IPv6 endpoint for the IMDS is only accessible on [instances built on the AWS Nitro System](#).

Currently only the AWS CLI and AWS SDKs support enabling the IPv6 endpoint for your instance.

AWS CLI

To enable the IPv6 endpoint for your instance

Use the [modify-instance-metadata-options](#) CLI command and set the `http-protocol-ipv6` parameter to enabled. Note that when specifying a value for `http-protocol-ipv6`, you must also set `http-endpoint` to enabled.

```
aws ec2 modify-instance-metadata-options \  
--instance-id i-1234567898abcdef0 \  
--http-protocol-ipv6 enabled \  
--http-endpoint enabled
```

PowerShell

To enable the IPv6 endpoint for your instance

Use the [Edit-EC2InstanceMetadataOption](#) Cmdlet and set the `HttpProtocolIpv6` parameter to enabled. Note that when specifying a value for `HttpProtocolIpv6`, you must also set `HttpEndpoint` to enabled.

```
(Edit-EC2InstanceMetadataOption `
```

```
-InstanceId i-1234567898abcdef0
-HttpProtocolIpv6 enabled
-HttpEndpoint enabled).InstanceMetadataOptions
```

Turn on access to instance metadata

You can turn on access to instance metadata by enabling the HTTP endpoint of the IMDS on your instance, regardless of which version of the IMDS you are using. You can reverse this change at any time by disabling the HTTP endpoint.

Use one of the following methods to turn on access to instance metadata on an instance.

Console

To turn on access to instance metadata

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance.
4. Choose **Actions, Instance settings, Modify instance metadata options**.
5. In the **Modify instance metadata options** dialog box, do the following:
 - a. For **Instance metadata service**, select **Enable**.
 - b. Choose **Save**.

AWS CLI

To turn on access to instance metadata

Use the [modify-instance-metadata-options](#) CLI command and set the `http-endpoint` parameter to `enabled`.

```
aws ec2 modify-instance-metadata-options \
--instance-id i-1234567898abcdef0 \
--http-endpoint enabled
```

PowerShell

To turn on access to instance metadata

Use the [Edit-EC2InstanceMetadataOption](#) Cmdlet and set the `HttpEndpoint` parameter to `enabled`.

```
(Edit-EC2InstanceMetadataOption ` 
    -InstanceId i-1234567898abcdef0 ` 
    -HttpEndpoint enabled).InstanceMetadataOptions
```

Turn off access to instance metadata

You can turn off access to instance metadata by disabling the HTTP endpoint of the IMDS on your instance, regardless of which version of the IMDS you are using. You can reverse this change at any time by enabling the HTTP endpoint.

Use one of the following methods to turn off access to instance metadata on an instance.

Console

To turn off access to instance metadata

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance.
4. Choose **Actions, Instance settings, Modify instance metadata options**.
5. In the **Modify instance metadata options** dialog box, do the following:
 - a. For **Instance metadata service**, clear **Enable**.
 - b. Choose **Save**.

AWS CLI

To turn off access to instance metadata

Use the [modify-instance-metadata-options](#) CLI command and set the `http-endpoint` parameter to `disabled`.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567898abcdef0 \
    --http-endpoint disabled
```

PowerShell

To turn off access to instance metadata

Use the [Edit-EC2InstanceMetadataOption](#) Cmdlet and set the `HttpEndpoint` parameter to disabled.

```
(Edit-EC2InstanceMetadataOption ` 
    -InstanceId i-1234567898abcdef0 ` 
    -HttpEndpoint disabled).InstanceMetadataOptions
```

Retrieve instance metadata

Because your instance metadata is available from your running instance, you do not need to use the Amazon EC2 console or the AWS CLI. This can be helpful when you're writing scripts to run from your instance. For example, you can access the local IP address of your instance from instance metadata to manage a connection to an external application.

Instance metadata is divided into categories. For a description of each instance metadata category, see [Instance metadata categories](#).

To view all categories of instance metadata from within a running instance, use the following IPv4 or IPv6 URIs.

IPv4

```
http://169.254.169.254/latest/meta-data/
```

IPv6

```
http://[fd00:ec2::254]/latest/meta-data/
```

The IP addresses are link-local addresses and are valid only from the instance. For more information, see [Link-local addresses](#) in this user guide and [Link-local address](#) on Wikipedia.

Note

The examples in this section use the IPv4 address of the IMDS: 169.254.169.254. If you are retrieving instance metadata for EC2 instances over the IPv6 address, ensure that you

enable and use the IPv6 address instead: [fd00:ec2::254]. The IPv6 address of the IMDS is compatible with IMDSv2 commands. The IPv6 address is only accessible on [instances built on the AWS Nitro System](#).

The command format is different, depending on whether you use IMDSv1 or IMDSv2. By default, you can use both versions of the IMDS. To require the use of IMDSv2, see [Use IMDSv2](#).

You can use PowerShell cmdlets to retrieve the URI. For example, if you are running version 3.0 or later of PowerShell, use the following cmdlet.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/
```

If you don't want to use PowerShell, you can install a third-party tool such as GNU Wget or cURL.

Important

If you install a third-party tool on a Windows instance, ensure that you read the accompanying documentation carefully, as the method of calling the HTTP and the output format might be different from what is documented here.

For the command to retrieve instance metadata from a Linux instance, see [Retrieve instance metadata](#) in the *Amazon EC2 User Guide for Windows Instances*.

Costs

You are not billed for HTTP requests used to retrieve instance metadata and user data.

Considerations

To avoid problems with instance metadata retrieval, consider the following:

- **In a container environment, we recommend setting the hop limit to 2.**

The AWS SDKs use IMDSv2 calls by default. If the IMDSv2 call receives no response, the SDK retries the call and, if still unsuccessful, uses IMDSv1. This can result in a delay, especially in a container environment. In a container environment, if the hop limit is 1, the IMDSv2 response does not return because going to the container is considered an additional network hop. To avoid the process of falling back to IMDSv1 and the resultant delay, in a container environment we recommend that you set the hop limit to 2. For more information, see [Configure the instance metadata options](#).

- **Create custom Windows AMIs using Sysprep.**

If you launch a Windows instance using a custom Windows AMI, to ensure that the IMDS works on the instance, the AMI must be a standardized image created [using Sysprep](#). Otherwise, the IMDS won't work.

- **For IMDSv2, you must use /latest/api/token when retrieving the token.**

Issuing PUT requests to any version-specific path, for example /2021-03-23/api/token, will result in the metadata service returning 403 Forbidden errors. This behavior is intended.

- **If IMDSv2 is required, IMDSv1 does not work.**

You can check if IMDSv2 is required for an instance, as follows: Select the instance to view its details, and check the value for **IMDSv2**. The value is either **Required** (only IMDSv2 can be used) or **Optional** (IMDSv2 and IMDSv1 can be used).

Responses and error messages

All instance metadata is returned as text (HTTP content type `text/plain`).

A request for a specific metadata resource returns the appropriate value, or a `404 - Not Found` HTTP error code if the resource is not available.

A request for a general metadata resource (the URI ends with a `/`) returns a list of available resources, or a `404 - Not Found` HTTP error code if there is no such resource. The list items are on separate lines, terminated by line feeds (ASCII 10).

For requests made using Instance Metadata Service Version 2, the following HTTP error codes can be returned:

- 400 - Missing or Invalid Parameters – The PUT request is not valid.
- 401 - Unauthorized – The GET request uses an invalid token. The recommended action is to generate a new token.
- 403 - Forbidden – The request is not allowed or the IMDS is turned off.

Examples of retrieving instance metadata

The following examples provide commands that you can use on a Windows instance. For the commands to retrieve instance metadata from a Linux instance, see [Retrieve instance metadata](#) in the *Amazon EC2 User Guide for Windows Instances*.

Examples

- [Get the available versions of the instance metadata](#)
- [Get the top-level metadata items](#)
- [Get the list of available public keys](#)
- [Show the formats in which public key 0 is available](#)
- [Get public key 0 \(in the OpenSSH key format\)](#)
- [Get the subnet ID for an instance](#)
- [Get the instance tags for an instance](#)

Get the available versions of the instance metadata

This example gets the available versions of the instance metadata. Each version refers to an instance metadata build when new instance metadata categories were released. The instance metadata build versions do not correlate with the Amazon EC2 API versions. The earlier versions are available to you in case you have scripts that rely on the structure and information present in a previous version.

Note

To avoid having to update your code every time Amazon EC2 releases a new instance metadata build, we recommend that you use `latest` in the path, and not the version number. For example, use `latest` as follows:

```
curl http://169.254.169.254/latest/meta-data/ami-id
```

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/

Get the subnet ID for an instance

This example gets the subnet ID for an instance.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -  
Method GET -Uri http://169.254.169.254/latest/meta-data/network/interfaces/  
macs/02:29:96:8f:6a:2d/subnet-id  
subnet-be9b61d7
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/network/  
interfaces/macs/02:29:96:8f:6a:2d/subnet-id  
subnet-be9b61d7
```

Get the instance tags for an instance

In the following examples, the sample instance has [tags on instance metadata enabled](#) and the instance tags Name=MyInstance and Environment=Dev.

This example gets all the instance tag keys for an instance.

IMDSv2

```
PS C:\> $token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/tags/instance  
Name  
Environment
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/tags/instance  
Name  
Environment
```

The following example gets the value of the Name key that was obtained in the preceding example. The IMDSv2 request uses the stored token that was created in the preceding example command, assuming it has not expired.

IMDSv2

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/tags/instance/Name  
MyInstance
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/tags/instance/Name  
MyInstance
```

Query throttling

We throttle queries to the IMDS on a per-instance basis, and we place limits on the number of simultaneous connections from an instance to the IMDS.

If you're using the IMDS to retrieve AWS security credentials, avoid querying for credentials during every transaction or concurrently from a high number of threads or processes, as this might lead to

throttling. Instead, we recommend that you cache the credentials until they start approaching their expiry time. For more information about IAM role and security credentials associated with the role, see [Retrieve security credentials from instance metadata](#).

If you are throttled while accessing the IMDS, retry your query with an exponential backoff strategy.

Limit IMDS access

You can consider using local firewall rules to disable access from some or all processes to the IMDS.

Note

For [instances built on the AWS Nitro System](#), the IMDS can be reached from your own network when a network appliance within your VPC, such as a virtual router, forwards packets to the IMDS address, and the default [source/destination check](#) on the instance is disabled. To prevent a source from outside your VPC reaching the IMDS, we recommend that you modify the configuration of the network appliance to drop packets with the destination IPv4 address of the IMDS 169.254.169.254 and, if you enabled the IPv6 endpoint, the IPv6 address of IMDS [fd00:ec2::254].

Using Windows firewall to limit access

The following PowerShell example uses the built-in Windows firewall to prevent the Internet Information Server webserver (based on its default installation user ID of NT AUTHORITY\IUSR) from accessing 169.254.169.254. It uses a *deny rule* to reject all instance metadata requests (whether IMDSv1 or IMDSv2) from any process running as that user.

```
PS C:\> $blockPrincipal = New-Object -TypeName System.Security.Principal.NTAccount ("NT AUTHORITY\IUSR")
PS C:\> $BlockPrincipalsID =
$blockPrincipal.Translate([System.Security.Principal.SecurityIdentifier]).Value
PS C:\> $BlockPrincipalSDDL = "D:(A;;CC;;;$BlockPrincipalsID)"
PS C:\> New-NetFirewallRule -DisplayName "Block metadata service from IIS" -Action
block -Direction out `

-Protocol TCP -RemoteAddress 169.254.169.254 -LocalUser $BlockPrincipalsSDDL
```

Or, you can consider only allowing access to particular users or groups, by using *allow rules*. Allow rules might be easier to manage from a security perspective, because they require you to make a

decision about what software needs access to instance metadata. If you use *allow rules*, it's less likely you will accidentally allow software to access the metadata service (that you did not intend to have access) if you later change the software or configuration on an instance. You can also combine group usage with allow rules, so that you can add and remove users from a permitted group without needing to change the firewall rule.

The following example prevents access to instance metadata by all processes running as an OS group specified in the variable `blockPrincipal` (in this example, the Windows group `Everyone`), except for processes specified in `exceptionPrincipal` (in this example, a group called `trustworthy-users`). You must specify both deny and allow principals because Windows Firewall, unlike the `! --uid-owner trustworthy-user` rule in Linux iptables, does not provide a shortcut mechanism to allow only a particular principal (user or group) by denying all the others.

```
PS C:\> $blockPrincipal = New-Object -TypeName System.Security.Principal.NTAccount  
("Everyone")  
PS C:\> $BlockPrincipalSID =  
    $blockPrincipal.Translate([System.Security.Principal.SecurityIdentifier]).Value  
PS C:\> $exceptionPrincipal = New-Object -TypeName System.Security.Principal.NTAccount  
("trustworthy-users")  
PS C:\> $ExceptionPrincipalSID =  
    $exceptionPrincipal.Translate([System.Security.Principal.SecurityIdentifier]).Value  
PS C:\> $PrincipalSDDL = "0:LSD:(D;;CC;;;$ExceptionPrincipalSID)(A;;CC;;;  
$BlockPrincipalSID)"  
PS C:\> New-NetFirewallRule -DisplayName "Block metadata service for  
    $($blockPrincipal.Value), exception: $($exceptionPrincipal.Value)" -Action block -  
Direction out -  
-Protocol TCP -RemoteAddress 169.254.169.254 -LocalUser $PrincipalSDDL
```

Note

To use local firewall rules, you need to adapt the preceding example commands to suit your needs.

Using netsh rules to limit access

You can consider blocking all software using netsh rules, but those are much less flexible.

```
C:\> netsh advfirewall firewall add rule name="Block metadata service altogether"  
dir=out protocol=TCP remoteip=169.254.169.254 action=block
```

Note

- To use local firewall rules, you need to adapt the preceding example commands to suit your needs.
- netsh rules must be set from an elevated command prompt, and can't be set to deny or allow particular principals.

Work with instance user data

You can use *instance user data* to customize your instances. When you launch an instance, you can store parameters or scripts as user data. Any scripts in user data are run when you launch the instance. You can view user data as an instance attribute. You can also view user data from your instance through the Instance Metadata Service (IMDS).

Considerations

- User data is treated as opaque data: what you give is what you get back. It is up to the instance to interpret it.
- User data must be base64-encoded. The Amazon EC2 console can perform the base64-encoding for you or accept base64-encoded input.
- User data is limited to 16 KB, in raw form, before it is base64-encoded. The size of a string of length n after base64-encoding is $\text{ceil}(n/3)*4$.
- User data must be base64-decoded when you retrieve it. If you retrieve the data using instance metadata or the console, it's decoded for you automatically.
- If you stop an instance, modify its user data, and start the instance, the updated user data is not run automatically when you start the instance. However, you can configure settings so that updated user data scripts are run one time when you start the instance or every time you reboot or start the instance.
- User data is an instance attribute. If you create an AMI from an instance, the instance user data is not included in the AMI.

Specify instance user data at launch

You can specify user data when you launch an instance. For console directions, see [Specify instance user data at launch](#). For an example that uses the Tools for Windows PowerShell, see [the section called “User data and the Tools for Windows PowerShell”](#).

Modify instance user data

You can modify user data for instances with an EBS root volume. The instance must be in the stopped state. For console directions, see [View and update the instance user data](#). For an example that uses the Tools for Windows PowerShell, see [the section called “User data and the Tools for Windows PowerShell”](#).

Retrieve instance user data from your instance

Note

The examples in this section use the IPv4 address of the IMDS: 169.254.169.254. If you are retrieving instance metadata for EC2 instances over the IPv6 address, ensure that you enable and use the IPv6 address instead: [fd00:ec2::254]. The IPv6 address of the IMDS is compatible with IMDSv2 commands. The IPv6 address is only accessible on [instances built on the AWS Nitro System](#).

To retrieve user data from an instance, use the following URI.

```
http://169.254.169.254/latest/user-data
```

A request for user data returns the data as it is (content type application/octet-stream). If the instance does not have any user data, the request returns 404 - Not Found.

This example returns user data that was provided as comma-separated text.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/user-data
```

```
1234,john,reboot,true | 4512,richard, | 173,,,
```

IMDSv1

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = Invoke-RestMethod  
-Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} `  
-Method PUT -Uri http://169.254.169.254/latest/api/token} -Method GET -uri  
http://169.254.169.254/latest/user-data  
1234,john,reboot,true | 4512,richard, | 173,,,
```

This example returns user data that was provided as a script.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-  
seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method  
GET -Uri http://169.254.169.254/latest/user-data  
<powershell>  
$file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")  
New-Item $file -ItemType file  
</powershell>  
<persist>true</persist>
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/user-data  
<powershell>  
$file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")  
New-Item $file -ItemType file  
</powershell>  
<persist>true</persist>
```

Retrieve instance user data from your computer

You can retrieve user data for an instance from your own computer. For console directions, see [View and update the instance user data](#). For an example that uses the Tools for Windows PowerShell, see [User data and the Tools for Windows PowerShell](#).

Retrieve dynamic data

To retrieve dynamic data from within a running instance, use the following URI.

```
http://169.254.169.254/latest/dynamic/
```

Note

The examples in this section use the IPv4 address of the IMDS: 169.254.169.254. If you are retrieving instance metadata for EC2 instances over the IPv6 address, ensure that you enable and use the IPv6 address instead: [fd00:ec2::254]. The IPv6 address of the IMDS is compatible with IMDSv2 commands. The IPv6 address is only accessible on [instances built on the AWS Nitro System](#).

This example shows how to retrieve the high-level instance identity categories.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/dynamic/instance-identity/document  
rsa2048  
pkcs7  
signature
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/dynamic/instance-identity/  
document  
rsa2048  
pkcs7  
signature
```

For more information about dynamic data and examples of how to retrieve it, see [Instance identity documents](#).

Instance metadata categories

Instance metadata is divided into categories. To retrieve instance metadata, you specify the category in the request, and the metadata is returned in the response.

When new categories are released, a new instance metadata build is created with a new version number. In the following table, the **Version when category was released** column specifies the build version when an instance metadata category was released. To avoid having to update your code every time Amazon EC2 releases a new instance metadata build, use `latest` instead of the version number in your metadata requests. For more information, see [Get the available versions of the instance metadata](#).

When Amazon EC2 releases a new instance metadata category, the instance metadata for the new category might not be available for existing instances. With instances built on the [Nitro system](#), you can retrieve instance metadata only for the categories that were available at launch. For instances with the Xen hypervisor, you can [stop and then start](#) the instance to update the categories that are available for the instance.

The following table lists the categories of instance metadata. Some of the category names include placeholders for data that is unique to your instance. For example, `mac` represents the MAC address for the network interface. You must replace the placeholders with actual values when you retrieve the instance metadata.

Category	Description	Version when category was released
ami-id	The AMI ID used to launch the instance.	1.0
ami-launch-index	If you launch multiple instances using the same <code>RunInstances</code> call, this value indicates the launch order for each instance. The value of the first instance launched is 0. If you launch	1.0

Category	Description	Version when category was released
	instances using Auto Scaling or EC2 fleet, this value is always 0.	
ami-manifest-path	The path to the AMI manifest file in Amazon S3. If you used an Amazon EBS-backed AMI to launch the instance, the returned result is unknown.	1.0
ancestor-ami-ids	The AMI IDs of any instances that were rebundled to create this AMI. This value will only exist if the AMI manifest file contained an ancestor-amis key.	2007-10-10
autoscaling/target-lifecycle-state	<p>Value showing the target Auto Scaling lifecycle state that an Auto Scaling instance is transitioning to. Present when the instance transitions to one of the target lifecycle states after March 10, 2022.</p> <p>Possible values: Detached InService Standby Terminated Warmed:Hibernated Warmed:Running Warmed:Stopped Warmed:Terminated . See Retrieve the target lifecycle state through instance metadata in the <i>Amazon EC2 Auto Scaling User Guide</i>.</p>	2021-07-15
block-device-mapping/ami	The virtual device that contains the root/boot file system.	2007-12-15

Category	Description	Version when category was released
block-device-mapping/ ebs <i>N</i>	<p>The virtual devices associated with any Amazon EBS volumes. Amazon EBS volumes are only available in metadata if they were present at launch time or when the instance was last started.</p> <p>The <i>N</i> indicates the index of the Amazon EBS volume (such as ebs1 or ebs2).</p>	2007-12-15
block-device-mapping/ ephemeral <i>N</i>	<p>The virtual devices for any non-NVMe instance store volumes. The <i>N</i> indicates the index of each volume. The number of instance store volumes in the block device mapping might not match the actual number of instance store volumes for the instance. The instance type determines the number of instance store volumes that are available to an instance. If the number of instance store volumes in a block device mapping exceeds the number available to an instance, the additional instance store volumes are ignored.</p>	2007-12-15
block-device-mapping/ root	<p>The virtual devices or partitions associated with the root devices or partitions on the virtual device, where the root (/ or C:) file system is associated with the given instance.</p>	2007-12-15

Category	Description	Version when category was released
block-device-mapping/ swap	The virtual devices associated with swap. Not always present.	2007-12-15
elastic-gpus/associations/ <i>elastic-gpu-id</i>	If there is an Elastic GPU attached to the instance, contains a JSON string with information about the Elastic GPU, including its ID and connection information.	2016-11-30
elastic-inference/associations/ <i>eia-id</i>	If there is an Elastic Inference accelerator attached to the instance, contains a JSON string with information about the Elastic Inference accelerator, including its ID and type.	2018-11-29
events/maintenance/history	If there are completed or canceled maintenance events for the instance, contains a JSON string with information about the events. For more information, see To view event history about completed or canceled events .	2018-08-17
events/maintenance/scheduled	If there are active maintenance events for the instance, contains a JSON string with information about the events. For more information, see View scheduled events .	2018-08-17

Category	Description	Version when category was released
events/recommendations/rebalance	<p>The approximate time, in UTC, when the EC2 instance rebalance recommendation notification is emitted for the instance. The following is an example of the metadata for this category:</p> <pre>{"noticeTime": "2020-11-05T08:22:00Z"}</pre> <p>This category is available only after the notification is emitted. For more information, see EC2 instance rebalance recommendations.</p>	2020-10-27
hostname	<p>If the EC2 instance is using IP-based naming (IPBN), this is the private IPv4 DNS hostname of the instance. If the EC2 instance is using Resource-based naming (RBN), this is the RBN. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0). For more information about IPBN and RBN, see Amazon EC2 instance hostname types.</p>	1.0

Category	Description	Version when category was released
iam/info	If there is an IAM role associated with the instance, contains information about the last time the instance profile was updated, including the instance's LastUpdated date, InstanceProfileArn, and InstanceProfileId. Otherwise, not present.	2012-01-12
iam/security-credentials/role-name	If there is an IAM role associated with the instance, <i>role-name</i> is the name of the role, and <i>role-name</i> contains the temporary security credentials associated with the role (for more information, see Retrieve security credentials from instance metadata). Otherwise, not present.	2012-01-12
identity-credentials/ec2/info	Information about the credentials in <code>identity-credentials/ec2/security-credentials/ec2-instance</code> .	2018-05-23

Category	Description	Version when category was released
identity-credentials/ec2/security-credentials/ec2-instance	Credentials for the instance identity role that allow on-instance software to identify itself to AWS to support features such as EC2 Instance Connect and AWS Systems Manager Default Host Management Configuration. These credentials have no policies attached, so they have no additional AWS API permissions beyond identifying the instance to the AWS feature. For more information, see Instance identity roles .	2018-05-23
instance-action	Notifies the instance that it should reboot in preparation for bundling. Valid values: none shutdown bundle-pending .	2008-09-01
instance-id	The ID of this instance.	1.0
instance-life-cycle	The purchasing option of this instance. For more information, see Instance purchasing options .	2019-10-01
instance-type	The type of instance. For more information, see Amazon EC2 instance types .	2007-08-29

Category	Description	Version when category was released
ipv6	<p>The IPv6 address of the instance. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0) network interface and the first IPv6 address assigned. If no IPv6 address exists on network interface[0], this item is not set and results in an HTTP 404 response.</p>	2021-01-03
kernel-id	<p>The ID of the kernel launched with this instance, if applicable.</p>	2008-02-01
local-hostname	<p>In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0). If the EC2 instance is using IP-based naming (IPBN), this is the private IPv4 DNS hostname of the instance. If the EC2 instance is using Resource-based naming (RBN), this is the RBN. For more information about IPBN, RBN, and EC2 instance naming, see Amazon EC2 instance hostname types.</p>	2007-01-19

Category	Description	Version when category was released
local-ipv4	The private IPv4 address of the instance. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0). If this is an IPv6-only instance, this item is not set and results in an HTTP 404 response.	1.0
mac	The instance's media access control (MAC) address. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0).	2011-01-01
metrics/vhostmd	No longer available.	2011-05-01
network/interfaces/mac/device-number	The unique device number associated with that interface. The device number corresponds to the device name; for example, a device-number of 2 is for the eth2 device. This category corresponds to the DeviceIndex and device-index fields that are used by the Amazon EC2 API and the EC2 commands for the AWS CLI.	2011-01-01
network/interfaces/mac/interface-id	The ID of the network interface.	2011-01-01

Category	Description	Version when category was released
network/interfaces/ macs/mac/ipv4-as sociations/public-ip	The private IPv4 addresses that are associated with each public IP address and assigned to that interface.	2011-01-01
network/interfaces/ macs/mac/ipv6s	The IPv6 addresses assigned to the interface.	2016-06-30
network/interfaces/ macs/mac/ipv6-prefix	The IPv6 prefix assigned to the network interface.	
network/interfaces/ macs/mac/local-h ostname	The private IPv4 DNS hostname of the instance. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0). If this is a IPv6-only instance, this is the resource-based name. For more information about IPBN and RBN, see Amazon EC2 instance hostname types .	2007-01-19
network/interfaces/ macs/mac/local-ipv4s	The private IPv4 addresses associated with the interface. If this is an IPv6-only network interface, this item is not set and results in an HTTP 404 response.	2011-01-01
network/interfaces/ macs/mac/mac	The instance's MAC address.	2011-01-01
network/interfaces/ macs/ <i>mac</i> /network-card	The index of the network card. Some instance types support multiple network cards.	2020-11-01

Category	Description	Version when category was released
network/interfaces/macs/mac/owner-id	The ID of the owner of the network interface. In multiple-interface environments, an interface can be attached by a third party, such as Elastic Load Balancing. Traffic on an interface is always billed to the interface owner.	2011-01-01
network/interfaces/macs/mac/public-hostname	The interface's public DNS (IPv4). This category is only returned if the enableDnsHostnames attribute is set to <code>true</code> . For more information, see DNS attributes for your VPC in the <i>Amazon VPC User Guide</i> . If the instance only has a public-IPv6 address and no public-IPv4 address, this item is not set and results in an HTTP 404 response.	2011-01-01
network/interfaces/macs/mac/public-ipv4s	The public IP address or Elastic IP addresses associated with the interface. There may be multiple IPv4 addresses on an instance.	2011-01-01
network/interfaces/macs/mac/security-groups	Security groups to which the network interface belongs.	2011-01-01
network/interfaces/macs/mac/security-group-ids	The IDs of the security groups to which the network interface belongs.	2011-01-01

Category	Description	Version when category was released
network/interfaces/macs/mac/subnet-id	The ID of the subnet in which the interface resides.	2011-01-01
network/interfaces/macs/mac/subnet-ipv4-cidr-block	The IPv4 CIDR block of the subnet in which the interface resides.	2011-01-01
network/interfaces/macs/mac/subnet-ipv6-cidr-blocks	The IPv6 CIDR block of the subnet in which the interface resides.	2016-06-30
network/interfaces/macs/mac/vpc-id	The ID of the VPC in which the interface resides.	2011-01-01
network/interfaces/macs/mac/vpc-ipv4-cidr-block	The primary IPv4 CIDR block of the VPC.	2011-01-01
network/interfaces/macs/mac/vpc-ipv4-cidr-blocks	The IPv4 CIDR blocks for the VPC.	2016-06-30
network/interfaces/macs/mac/vpc-ipv6-cidr-blocks	The IPv6 CIDR block of the VPC in which the interface resides.	2016-06-30
placement/availability-zone	The Availability Zone in which the instance launched.	2008-02-01
placement/availability-zone-id	The static Availability Zone ID in which the instance is launched. The Availability Zone ID is consistent across accounts. However, it might be different from the Availability Zone, which can vary by account.	2019-10-01

Category	Description	Version when category was released
placement/group-name	The name of the placement group in which the instance is launched.	2020-08-24
placement/host-id	The ID of the host on which the instance is launched. Applicable only to Dedicated Hosts.	2020-08-24
placement/partition-number	The number of the partition in which the instance is launched.	2020-08-24
placement/region	The AWS Region in which the instance is launched.	2020-08-24
product-codes	AWS Marketplace product codes associated with the instance, if any.	2007-03-01
public-hostname	The instance's public DNS (IPv4). This category is only returned if the enableDnsHostnames attribute is set to <code>true</code> . For more information, see DNS attributes for your VPC in the <i>Amazon VPC User Guide</i> . If the instance only has a public-IPv6 address and no public-IPv4 address, this item is not set and results in an HTTP 404 response.	2007-01-19
public-ipv4	The public IPv4 address. If an Elastic IP address is associated with the instance, the value returned is the Elastic IP address.	2007-01-19

Category	Description	Version when category was released
public-keys/0/openssh-key	Public key. Only available if supplied at instance launch time.	1.0
ramdisk-id	The ID of the RAM disk specified at launch time, if applicable.	2007-10-10
reservation-id	The ID of the reservation.	1.0
security-groups	<p>The names of the security groups applied to the instance.</p> <p>After launch, you can change the security groups of the instances. Such changes are reflected here and in <code>network/interfaces/mac/<i>mac</i>/security-groups</code>.</p>	1.0
services/domain	The domain for AWS resources for the Region.	2014-02-25
services/partition	The partition that the resource is in. For standard AWS Regions, the partition is aws. If you have resources in other partitions, the partition is <code>aws-<i>partition name</i></code> . For example, the partition for resources in the China (Beijing) Region is aws-cn.	2015-10-20

Category	Description	Version when category was released
spot/instance-action	The action (hibernate, stop, or terminate) and the approximate time, in UTC, when the action will occur. This item is present only if the Spot Instance has been marked for hibernate, stop, or terminate. For more information, see instance-action .	2016-11-15
spot/termination-time	The approximate time, in UTC, that the operating system for your Spot Instance will receive the shutdown signal. This item is present and contains a time value (for example, 2015-01-05T18:02:00Z) only if the Spot Instance has been marked for termination by Amazon EC2. The termination-time item is not set to a time if you terminated the Spot Instance yourself. For more information, see termination-time .	2014-11-05
tags/instance	The instance tags associated with the instance. Only available if you explicitly allow access to tags in instance metadata. For more information, see Allow access to tags in instance metadata .	2021-03-23

Dynamic data categories

The following table lists the categories of dynamic data.

Category	Description	Version when category was released
fws/instance-monitoring	Value showing whether the customer has enabled detailed one-minute monitoring in CloudWatch. Valid values: enabled disabled	2009-04-04
instance-identity/document	JSON containing instance attributes, such as instance-id, private IP address, etc. See Instance identity documents .	2009-04-04
instance-identity/pkcs7	Used to verify the document's authenticity and content against the signature. See Instance identity documents .	2009-04-04
instance-identity/signature	Data that can be used by other parties to verify its origin and authenticity. See Instance identity documents .	2009-04-04

Instance identity documents

Each instance that you launch has an instance identity document that provides information about the instance itself. You can use the instance identity document to validate the attributes of the instance.

The instance identity document is generated when the instance is stopped and started, restarted, or launched. The instance identity document is exposed (in plaintext JSON format) through the Instance Metadata Service (IMDS). The IPv4 address 169.254.169.254 is a link-local address and is valid only from the instance. For more information, see [Link-local address](#) on Wikipedia. The IPv6 address [fd00:ec2::254] is a unique local address and is valid only from the instance. For more information, see [Unique local address](#) on Wikipedia.

Note

The examples in this section use the IPv4 address of the IMDS: 169.254.169.254. If you are retrieving instance metadata for EC2 instances over the IPv6 address, ensure that you enable and use the IPv6 address instead: [fd00:ec2::254]. The IPv6 address of the IMDS is compatible with IMDSv2 commands. The IPv6 address is only accessible on [Instances built on the AWS Nitro System](#).

You can retrieve the instance identity document from a running instance at any time. The instance identity document includes the following information:

Data	Description
accountId	The ID of the AWS account that launched the instance.
architecture	The architecture of the AMI used to launch the instance (i386 x86_64 arm64).
availabilityZone	The Availability Zone in which the instance is running.
billingProducts	The billing products of the instance.
devpayProductCodes	Deprecated.
imageId	The ID of the AMI used to launch the instance.
instanceId	The ID of the instance.
instanceType	The instance type of the instance.
kernelId	The ID of the kernel associated with the instance, if applicable.
marketplaceProductCodes	The AWS Marketplace product code of the AMI used to launch the instance.
pendingTime	The date and time that the instance was launched.

Data	Description
privateIp	The private IPv4 address of the instance.
ramdiskId	The ID of the RAM disk associated with the instance, if applicable.
region	The Region in which the instance is running.
version	The version of the instance identity document format.

Retrieve the plaintext instance identity document

To retrieve the plaintext instance identity document

Connect to the instance and run one of the following commands depending on the version of the IMDS used by the instance.

IMDSv2

```
PS C:\> [string]$token = (Invoke-WebRequest -Method Put -Headers @{'X-aws-ec2-metadata-token-ttl-seconds' = '21600'} http://169.254.169.254/latest/api/token).Content
```

```
PS C:\> (Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/document).Content
```

IMDSv1

```
PS C:\> (Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/document).Content
```

The following is example output.

```
{
  "devpayProductCodes" : null,
  "marketplaceProductCodes" : [ "1abc2defghijklm3nopqrs4tu" ],
  "availabilityZone" : "us-west-2b",
  "privateIp" : "10.158.112.84",
```

```
"version" : "2017-09-30",
"instanceId" : "i-1234567890abcdef0",
"billingProducts" : null,
"instanceType" : "t2.micro",
"accountId" : "123456789012",
"imageId" : "ami-5fb8c835",
"pendingTime" : "2016-11-19T16:32:11Z",
"architecture" : "x86_64",
"kernelId" : null,
"ramdiskId" : null,
"region" : "us-west-2"
}
```

Verify the instance identity document

If you intend to use the contents of the instance identity document for an important purpose, you should verify its contents and authenticity before using it.

The plaintext instance identity document is accompanied by three hashed and encrypted signatures. You can use these signatures to verify the origin and authenticity of the instance identity document and the information that it includes. The following signatures are provided:

- Base64-encoded signature—This is a base64-encoded SHA256 hash of the instance identity document that is encrypted using an RSA key pair.
- PKCS7 signature—This is a SHA1 hash of the instance identity document that is encrypted using a DSA key pair.
- RSA-2048 signature—This is a SHA256 hash of the instance identity document that is encrypted using an RSA-2048 key pair.

Each signature is available at a different endpoint in the instance metadata. You can use any one of these signatures depending on your hashing and encryption requirements. To verify the signatures, you must use the corresponding AWS public certificate.

The following topics provide detailed steps for validating the instance identity document using each signature.

- [Use the PKCS7 signature to verify the instance identity document](#)
- [Use the base64-encoded signature to verify the instance identity document](#)
- [Use the RSA-2048 signature to verify the instance identity document](#)

Use the PKCS7 signature to verify the instance identity document

This topic explains how to verify the instance identity document using the PKCS7 signature and the AWS DSA public certificate.

Prerequisites

This procedure requires the `System.Security` Microsoft .NET Core class. To add the class to your PowerShell session, run the following command.

```
PS C:\> Add-Type -AssemblyName System.Security
```

Note

The command adds the class to the current PowerShell session only. If you start a new session, you must run the command again.

To verify the instance identity document using the PKCS7 signature and the AWS DSA public certificate

1. Connect to the instance.
2. Retrieve the PKCS7 signature from the instance metadata, convert it to a byte array, and add it to a variable named `$Signature`. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> [string]$token = (Invoke-WebRequest -Method Put -Headers @{'X-aws-ec2-metadata-token-ttl-seconds' = '21600'} http://169.254.169.254/latest/api/token).Content
```

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/pkcs7).Content)
```

IMDSv1

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest  
http://169.254.169.254/latest/dynamic/instance-identity/pkcs7).Content)
```

3. Retrieve the plaintext instance identity document from the instance metadata, convert it to a byte array, and add it to a variable named \$Document. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest -Headers  
@{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/  
instance-identity/document).Content)
```

IMDSv1

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest  
http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

4. Find the **DSA** public certificate for your Region in [AWS public certificates](#) and add the contents to a new file named `certificate.pem`.
5. Extract the certificate from the certificate file and store it in a variable named \$Store.

```
PS C:\> $Store =  
[Security.Cryptography.X509Certificates.X509Certificate2Collection]::new([Security.Cryptography  
Path certificate.pem]))
```

6. Verify the signature.

```
PS C:\> $SignatureDocument = [Security.Cryptography.Pkcs.SignedCms]::new()
```

```
PS C:\> $SignatureDocument.Decode($Signature)
```

```
PS C:\> $SignatureDocument.CheckSignature($Store, $true)
```

If the signature is valid, the command returns no output. If the signature cannot be verified, the command returns Exception calling "CheckSignature" with "2"

argument(s): "Cannot find the original signer. If your signature cannot be verified, contact AWS Support.

7. Validate the content of the instance identity document.

```
PS C:
```

```
\> [Linq.Enumerable]::SequenceEqual($SignatureDocument.ContentInfo.Content, $Document)
```

If the content of the instance identity document is valid, the command returns True. If instance identity document cannot be validated, contact AWS Support.

Use the base64-encoded signature to verify the instance identity document

This topic explains how to verify the instance identity document using the base64-encoded signature and the AWS RSA public certificate.

To validate the instance identity document using the base64-encoded signature and the AWS RSA public certificate

1. Connect to the instance.
2. Retrieve the base64-encoded signature from the instance metadata, convert it to a byte array, and add it to variable named \$Signature. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> [string]$token = (Invoke-WebRequest -Method Put -Headers @{'X-aws-ec2-metadata-token-ttl-seconds' = '21600'} http://169.254.169.254/latest/api/token).Content
```

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/signature).Content)
```

IMDSv1

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/signature).Content)
```

3. Retrieve the plaintext instance identity document from the instance metadata, convert it to a byte array, and add it to a variable named \$Document. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

IMDSv1

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

4. Find the RSA public certificate for your Region in [AWS public certificates](#) and add the contents to a new file named `certificate.pem`.
5. Verify the instance identity document.

```
PS C:\> [Security.Cryptography.X509Certificates.X509Certificate2]::new((Resolve-Path certificate.pem)).PublicKey.Key.VerifyData($Document, 'SHA256', $Signature)
```

If the signature is valid, the command returns True. If the signature cannot be verified, contact AWS Support.

Use the RSA-2048 signature to verify the instance identity document

This topic explains how to verify the instance identity document using the RSA-2048 signature and the AWS RSA-2048 public certificate.

Prerequisites

This procedure requires the `System.Security` Microsoft .NET Core class. To add the class to your PowerShell session, run the following command.

```
PS C:\> Add-Type -AssemblyName System.Security
```

Note

The command adds the class to the current PowerShell session only. If you start a new session, you must run the command again.

To verify the instance identity document using the RSA-2048 signature and the AWS RSA-2048 public certificate

1. Connect to the instance.
2. Retrieve the RSA-2048 signature from the instance metadata, convert it to a byte array, and add it to a variable named \$Signature. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> [string]$token = (Invoke-WebRequest -Method Put -Headers @{'X-aws-ec2-metadata-token-ttl-seconds' = '21600'} http://169.254.169.254/latest/api/token).Content
```

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/rsa2048).Content)
```

IMDSv1

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/rsa2048).Content)
```

3. Retrieve the plaintext instance identity document from the instance metadata, convert it to a byte array, and add it to a variable named \$Document. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

IMDSv1

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

4. Find the **RSA-2048** public certificate for your Region in [AWS public certificates](#) and add the contents to a new file named `certificate.pem`.
5. Extract the certificate from the certificate file and store it in a variable named `$Store`.

```
PS C:\> $Store = [Security.Cryptography.X509Certificates.X509Certificate2Collection]::new([Security.Cryptography.Path certificate.pem)))
```

6. Verify the signature.

```
PS C:\> $SignatureDocument = [Security.Cryptography.Pkcs.SignedCms]::new()
```

```
PS C:\> $SignatureDocument.Decode($Signature)
```

```
PS C:\> $SignatureDocument.CheckSignature($Store, $true)
```

If the signature is valid, the command returns no output. If the signature cannot be verified, the command returns Exception calling "CheckSignature" with "2" argument(s): "Cannot find the original signer. If your signature cannot be verified, contact AWS Support.

7. Validate the content of the instance identity document.

```
PS C:\> [Linq.Enumerable]::SequenceEqual($SignatureDocument.ContentInfo.Content, $Document)
```

If the content of the instance identity document is valid, the command returns True. If instance identity document cannot be validated, contact AWS Support.

AWS public certificates

The following AWS public certificates can be used to verify the contents of an instance's instance identity document as described in the following topics:

- [Verify using the PKCS7 signature](#)
- [Verify using the base64-encoded signature](#)
- [Verify using the RSA-2048 signature](#)

Ensure that you use the correct certificate for your Region and for the verification procedure that you're using. If you're verifying the PKCS7 signature, use the DSA certificate. If you're verifying the base64-encoded signature, use the RSA certificate. If you're verifying the RSA-2048 signature, use the RSA-2048 certificate.

Expand each Region below to view the Region-specific certificates.

US East (Ohio) — us-east-2

Instance identity roles

Each instance that you launch has an *instance identity role* that represents its identity. An instance identity role is a type of IAM role. AWS services and features that are integrated to use the instance identity role can use it to identify the instance to the service.

The instance identity role credentials are accessible from the Instance Metadata Service (IMDS) at `/identity-credentials/ec2/security-credentials/ec2-instance`. The credentials consist of an AWS temporary access key pair and a session token. They are used to sign AWS Sigv4 requests to the AWS services that use the instance identity role. The credentials are present in the instance metadata regardless of whether a service or feature that makes use of instance identity roles is enabled on the instance.

Instance identity roles are automatically created when an instance is launched, have no role-trust policy document, and are not subject to any identity or resource policy.

Supported services

The following AWS services use the instance identity role:

- **Amazon EC2 – [EC2 Instance Connect](#)** uses the instance identity role to update the host keys for a Linux instance.
- **Amazon GuardDuty – [Runtime Monitoring](#)** uses the instance identity role to allow the runtime agent to send security telemetry to the GuardDuty VPC endpoint.
- **AWS Security Token Service (AWS STS)** – Instance identity role credentials can be used with the AWS STS [GetCallerIdentity](#) action.
- **AWS Systems Manager** – When using [Default Host Management Configuration](#), AWS Systems Manager uses the identity provided by the instance identity role to register EC2 instances. After identifying your instance, Systems Manager can pass your `AWSSystemsManagerDefaultEC2InstanceManagementRole` IAM role to your instance.

Instance identity roles can't be used with other AWS services or features because they do not have an integration with instance identity roles.

Instance identity role ARN

The instance identity role ARN takes the following format:

```
arn:aws-partition:iam::account-number:assumed-role/aws:ec2-instance/instance-id
```

For example:

```
arn:aws:iam::0123456789012:assumed-role/aws:ec2-instance/i-0123456789example
```

For more information about ARNs, see [Amazon Resource Names \(ARNs\)](#) in the *IAM User Guide*.

Best practices and recommendations for SQL Server clustering in Amazon EC2

For information about SQL Server clustering in Amazon EC2, see [Best practices and recommendations for SQL Server clustering on Amazon EC2](#) in the *Microsoft SQL Server on Amazon EC2 User Guide*.

Install WSL on your Windows instance

Windows Subsystem for Linux (WSL) is a free download that you can install on your Windows instance. By installing WSL, you can run native Linux command line tools directly on your Windows instance and use the Linux tools for scripting, alongside your traditional Windows desktop. You can easily swap between Linux and Windows on a single Windows instance, which you might find useful in a development environment.

For more information about WSL, see the [Windows Subsystem for Linux Documentation](#) on the *Microsoft Build* website.

Limitations

- WSL is available in two versions: WSL 1 and WSL 2.
 - For .metal EC2 instances, you can install either WSL 1 or WSL 2.
 - For virtualized EC2 instances, you must install WSL 1.
- For Windows Server operating systems, WSL can only be installed on instances running the following:
 - Windows Server 2019
 - Windows Server 2022

Install WSL

The following instructions install WSL on an EC2 instance running Windows Server 2022. For the instructions to install WSL on an EC2 instance running Windows Server 2019, see [Install WSL on previous versions of Windows Server](#) on the Microsoft website. After you've followed those instructions, you can use step 3 in the instructions below to configure WSL to use WSL 1.

To install WSL 1

1. To install WSL, run the following standard installation command on your EC2 instance, but make sure to enable WSL 1 by including `--enable-wsl1`. By default, WSL 2 is installed. If your instance was launched using a virtualized instance type, you must complete step 3 in this procedure to set the version to WSL 1.

```
wsl --install --enable-wsl1
```

2. Restart your EC2 instance.
3. To configure WSL to use WSL 1, run the following command on your instance. For more information about setting the WSL version, see [Manual installation steps for older versions of WSL](#) on the *Microsoft Build* website.

```
wsl --set-default-version 1
```

To install WSL 2

- To install WSL, run the following standard installation command on your EC2 instance. By default, WSL 2 is installed. If you are installing WSL on a `.metal` instance, then this is the only step to perform.

```
wsl --install
```

For more information, see [Install Linux on Windows with WSL](#) on the *Microsoft Build* website.

Upgrade an Amazon EC2 Windows instance to a newer version of Windows Server

There are two methods to upgrade an earlier version of Windows Server running on an instance: in-place upgrade and migration (also called side-by-side upgrade). An in-place upgrade upgrades the operating system files while your personal settings and files are intact. A migration involves capturing settings, configurations, and data and porting these to a newer operating system on a fresh Amazon EC2 instance.

Microsoft has traditionally recommended migrating to a newer version of Windows Server instead of upgrading. Migrating can result in fewer upgrade errors or issues, but can take longer than an in-place upgrade because of the need to provision a new instance, plan for and port applications, and adjust configurations settings on the new instance. An in-place upgrade can be faster, but software incompatibilities can produce errors.

Contents

- [Perform an in-place upgrade](#)
- [Perform an automated upgrade](#)
- [Migrate to latest generation instance types](#)
- [Windows to Linux replatforming assistant for Microsoft SQL Server databases](#)
- [Troubleshoot an upgrade](#)

Perform an in-place upgrade

Before you perform an in-place upgrade, you must determine which network drivers the instance is running. PV network drivers enable you to access your instance using Remote Desktop. Instances use either AWS PV, Intel Network Adapter, or the Enhanced Networking drivers. For more information, see [Paravirtual drivers for Windows instances](#).

Before you begin an in-place upgrade

Complete the following tasks and note the following important details before you begin your in-place upgrade.

- Read the Microsoft documentation to understand the upgrade requirements, known issues, and restrictions. Also review the official instructions for upgrading.
 - [Upgrade Options for Windows Server 2012](#)
 - [Upgrade Options for Windows Server 2012 R2](#)
 - [Upgrade and conversion options for Windows Server 2016](#)
 - [Upgrade and conversion options for Windows Server 2019](#)
 - [Upgrade and conversion options for Windows Server 2022](#)
 - [Windows Server Upgrade Center](#)
- We recommend performing an operating system upgrade on instances with at least 2 vCPUs and 4GB of RAM. If needed, you can change the instance to a larger size of the same type (t2.small)

to t2.large, for example), perform the upgrade, and then resize it back to the original size. If you are required to retain the instance size, you can monitor the progress using the [instance console screenshot](#). For more information, see [Change the instance type](#).

- Verify that the root volume on your Windows instance has enough free disk space. The Windows Setup process might not warn you of insufficient disk space. For information about how much disk space is required to upgrade a specific operating system, see the Microsoft documentation. If the volume does not have enough space, it can be expanded. For more information, see [Amazon EBS Elastic Volumes](#) in the *Amazon EBS User Guide*.
- Determine your upgrade path. You must upgrade the operating system to the same architecture. For example, you must upgrade a 32-bit system to a 32-bit system. Windows Server 2008 R2 and later are 64-bit only.
- Disable antivirus and anti-spyware software and firewalls. These types of software can conflict with the upgrade process. Re-enable antivirus and anti-spyware software and firewalls after the upgrade completes.
- Update to the latest drivers as described in [Migrate to latest generation instance types](#).
- The Upgrade Helper Service only supports instances running Citrix PV drivers. If the instance is running Red Hat drivers, you must manually [upgrade those drivers](#) first.

Upgrade an instance in-place with AWS PV, Intel Network Adapter, or the Enhanced Networking drivers

Use the following procedure to upgrade a Windows Server instance using the AWS PV, Intel Network Adapter, or the Enhanced Networking network drivers.

To perform the in-place upgrade

1. Create an AMI of the system you plan to upgrade for either backup or testing purposes. You can then perform the upgrade on the copy to simulate a test environment. If the upgrade completes, you can switch traffic to this instance with little downtime. If the upgrade fails, you can revert to the backup. For more information, see [Create a custom Windows AMI](#).
2. Ensure that your Windows Server instance is using the latest network drivers.
 - a. To update your AWS PV driver, see [Upgrade PV drivers on Windows instances](#).
 - b. To update your ENA driver, see [Install or upgrade Elastic Network Adapter \(ENA\) driver](#).
 - c. To update your Intel drivers, see [Enable enhanced networking with the Intel 82599 VF interface on Windows instances](#)

3. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
4. In the navigation pane, choose **Instances**. Locate the instance. Make a note of the instance ID and Availability Zone for the instance. You need this information later in this procedure.
5. If you are upgrading from Windows Server 2012 or 2012 R2 to Windows Server 2016, 2019, or 2022, perform the following on your instance before proceeding:
 - a. Uninstall the EC2Config service. For more information, see [Stop, restart, delete, or uninstall EC2Config](#).
 - b. Install EC2Launch v1 or the EC2Launch v2 agent. For more information, see [Configure a Windows instance using EC2Launch](#) and [Configure a Windows instance using EC2Launch v2](#).
 - c. Install the AWS Systems Manager SSM Agent. For more information, see [Working with SSM Agent](#) in the *AWS Systems Manager User Guide*.
6. Create a new volume from a Windows Server installation media snapshot.
 - a. In the left navigation pane, under **Elastic Block Store**, choose **Snapshots**.
 - b. From the filter bar, choose **Public snapshots**.
 - c. In the search bar, specify the following filters:
 - Choose **Owner Alias**, then **=**, then **amazon**.
 - Choose **Description**, and then start typing **Windows**. Select the Windows filter that matches the system architecture and language preference you're upgrading to. For example, choose **Windows 2019 English Installation Media** to upgrade to Windows Server 2019.
 - d. Select the check box next to the snapshot that matches the system architecture and language preference you're upgrading to, and then choose **Actions, Create volume from snapshot**.
 - e. On the **Create volume** page, choose the Availability Zone that matches your Windows instance, and then choose **Create volume**.
7. In the **Successfully created volume vol-1234567890example** banner at the top of the page, choose the ID of the volume that you just created.
8. Choose **Actions, Attach volume**.
9. On the **Attach volume** page, for **Instance**, select the instance ID of your Windows instance, and then choose **Attach volume**.

10. Make the new volume available for use by following the steps at [Make an Amazon EBS volume available for use on Windows](#).

 **Important**

Do not initialize the disk because doing so will delete the existing data.

11. In Windows PowerShell, switch to the new volume drive. Begin the upgrade by opening the installation media volume you attached to the instance.

- a. If you are upgrading to Windows Server 2016 or later, run the following:

```
.\setup.exe /auto upgrade /dynamicupdate disable
```

 **Note**

Running the setup.exe with the /dynamicupdate option set to disabled prevents Windows from installing updates during the Windows Server upgrade process, as installing updates during the upgrade can cause failures. You can install updates with Windows Update after the upgrade completes.

If you are upgrading to an earlier version of Windows Server, run the following:

```
Sources\setup.exe
```

- b. For **Select the operating system you want to install**, select the full installation SKU for your Windows Server instance, and choose **Next**.
- c. For **Which type of installation do you want?**, choose **Upgrade**.
- d. Complete the wizard.

Windows Server Setup copies and processes files. After several minutes, your Remote Desktop session closes. The time it takes to upgrade depends on the number of applications and server roles running on your Windows Server instance. The upgrade process could take as little as 40 minutes or several hours. The instance fails status check 1 of 2 during the upgrade process. When the upgrade completes, both status checks pass. You can check the system log for console output

or use Amazon CloudWatch metrics for disk and CPU activity to determine whether the upgrade is progressing.

Note

If upgrading to Windows Server 2019, after the upgrade is complete you can change the desktop background manually to remove the previous operating system name if desired.

If the instance has not passed both status checks after several hours, see [Troubleshoot an upgrade](#).

Post upgrade tasks

1. Log in to the instance to initiate an upgrade for the .NET Framework and reboot the system when prompted.
2. If you haven't already done so in a prior step, install the EC2Launch v1 or EC2Launch v2 agent. For more information, see [Configure a Windows instance using EC2Launch](#) and [Configure a Windows instance using EC2Launch v2](#).
3. If you upgraded to Windows Server 2012 R2, we recommend that you upgrade the PV drivers to AWS PV drivers. If you upgraded on a Nitro-based instance, we recommend that you install or upgrade the NVME and ENA drivers. For more information, see [Windows Server 2012 R2](#), [Install or upgrade AWS NVMe drivers using PowerShell](#), or [Enable enhanced networking on Windows](#).
4. Re-enable antivirus and anti-spyware software and firewalls.

Perform an automated upgrade

You can perform an automated upgrade of your Windows and SQL Server instances on AWS with AWS Systems Manager Automation runbooks.

Contents

- [Related services](#)
- [Execution options](#)
- [Upgrade Windows Server](#)
- [Upgrade SQL Server](#)

Related services

The following AWS services are used in the automated upgrade process:

- **AWS Systems Manager.** AWS Systems Manager is a powerful, unified interface for centrally managing your AWS resources. For more information, see the [AWS Systems Manager User Guide](#).
- AWS Systems Manager Agent (SSM Agent) is Amazon software that can be installed and configured on an Amazon EC2 instance, an on-premises server, or a virtual machine (VM). SSM Agent makes it possible for Systems Manager to update, manage, and configure these resources. The agent processes requests from the Systems Manager service in the AWS Cloud, and then runs them as specified in the request. For more information, see [Working with SSM Agent](#) in the [AWS Systems Manager User Guide](#).
- **AWS Systems Manager SSM runbooks.** An SSM runbook defines the actions that Systems Manager performs on your managed instances. SSM runbooks use JavaScript Object Notation (JSON) or YAML, and they include steps and parameters that you specify. This topic uses two Systems Manager SSM runbooks for automation. For more information, see [AWS Systems Manager Automation runbook reference](#) in the [AWS Systems Manager User Guide](#).

Execution options

When you select **Automation** on the Systems Manager console, select **Execute**. After you select an Automation document, you are then prompted to choose an automation execution option. You choose from the following options. In the steps for the paths provided later in this topic, we use the **Simple execution** option.

Simple execution

Choose this option if you want to update a single instance but do not want to go through each automation step to audit the results. This option is explained in further detail in the upgrade steps that follow.

Rate control

Choose this option if you want to apply the upgrade to more than one instance. You define the following settings.

- **Parameter**

This setting, which is also set in Multi-Account and Region settings, defines how your automation branches out.

- **Targets**

Select the target to which you want to apply the automation. This setting is also set in Multi-Account and Region settings.

- **Parameter Values**

Use the values defined in the automation document parameters.

- **Resource Group**

In AWS, a resource is an entity you can work with. Examples include Amazon EC2 instances, AWS CloudFormation stacks, or Amazon S3 buckets. If you work with multiple resources, it might be useful to manage them as a group as opposed to moving from one AWS service to another for every task. In some cases, you may want to manage large numbers of related resources, such as EC2 instances that make up an application layer. In this case, you will likely need to perform bulk actions on these resources at one time.

- **Tags**

Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This categorization is useful when you have many resources of the same type. You can quickly identify a specific resource using the assigned tags.

- **Rate Control**

Rate Control is also set in Multi-Account and Region settings. When you set the rate control parameters, you define how many of your fleet to apply the automation to, either by target count or by percentage of the fleet.

Multi-Account and Region

In addition to the parameters specified under Rate Control that are also used in the Multi-Account and Region settings, there are two additional settings:

- **Accounts and organizational units (OUs)**

Specify multiple accounts on which you want to run the automation.

- **AWS Regions**

Specify multiple AWS Regions where you want to run the automation.

Manual execution

This option is similar to **Simple execution**, but allows you to step through each automation step and audit the results.

Upgrade Windows Server

The [AWSEC2-CloneInstanceAndUpgradeWindows](#) runbook creates an Amazon Machine Image (AMI) from a Windows Server instance in your account and upgrades this AMI to a supported version of your choice. This multi-step process can take up to two hours to complete.

To upgrade your Windows Server 2008 R2 instance to Windows Server 2016, 2019, or 2022, an in-place upgrade is performed twice, first from Windows Server 2008 R2 to Windows Server 2012 R2, and then from Windows Server 2012 R2 to Windows Server 2016, 2019, or 2022. Directly upgrading Windows Server 2008 R2 to Windows Server 2016, 2019, or 2022 is not supported.

In this workflow, the automation creates an AMI from the instance and then launches the new AMI in the subnet you provide. The automation workflow performs an in-place upgrade from Windows Server 2008 R2, 2016, 2019 to the selected version (Windows Server 2012 R2, 2016, 2019, or 2022). It also updates or installs the AWS drivers required by the upgraded instance. After the upgrade is complete, the workflow creates a new AMI and terminates the upgraded instance. If you upgrade from Windows Server 2008 R2 to Windows Server 2016, 2019, or 2022, the automation creates two AMIs because the in-place upgrade is performed twice.

There are two AMIs included in the automated upgrade process:

- **Current running instance.** The first AMI is the current running instance, which is not upgraded. This AMI is used to launch another instance to run the in-place upgrade. When the process is complete, this AMI is deleted from your account, unless you specifically request to keep the original instance. This setting is handled by the parameter `KeepPreUpgradeImageBackUp` (default value is `false`, which means the AMI is deleted by default).
- **Upgraded AMI.** This AMI is the outcome of the automation process.

The final result is one AMI, which is the upgraded instance of the AMI.

When the upgrade is complete, you can test your application functionality by launching the new AMI in your Amazon VPC. After testing, and before you perform another upgrade, schedule application downtime before completely switching to the upgraded instance.

Windows Server automated upgrade paths

The Systems Manager Automation runbook [AWSEC2-CloneInstanceAndUpgradeWindows](#) supports the following upgrade paths:

- Windows Server 2008 R2 to Windows Server 2012 R2
- Windows Server 2012 R2 to Windows Server 2016
- Windows Server 2012 R2 to Windows Server 2019
- Windows Server 2012 R2 to Windows Server 2022
- Windows Server 2016 to Windows Server 2019
- Windows Server 2016 to Windows Server 2022
- Windows Server 2019 to Windows Server 2022

Prerequisites

In order to automate your Windows Server upgrade with the AWS Systems Manager Automation document, you must perform the following tasks:

- Create an IAM role with the specified IAM policies to allow Systems Manager to perform automation tasks on your Amazon EC2 instances and verify that you meet the prerequisites to use Systems Manager. For more information, see [Creating a role to delegate permissions to an AWS service](#) in the *AWS Identity and Access Management User Guide*.
- [Select the option for how you want the automation to be run](#). The options for execution are **Simple execution**, **Rate control**, **Multi-account and Region**, and **Manual execution**. For more information about these options, see [Execution options](#).
- Verify that SSM Agent is installed on your instance. For more information see [Installing and configuring SSM Agent on Amazon EC2 instances for Windows Server](#).
- Windows PowerShell 3.0 or later must be installed on your instance.
- For instances that are joined to a Microsoft Active Directory domain, we recommend specifying a SubnetId that does not have connectivity to your domain controllers to help avoid hostname conflicts.

- The instance subnet must have outbound connectivity to the internet, which provides access to AWS services such as Amazon S3 and access to download patches from Microsoft. This requirement is met if either the subnet is a public subnet and the instance has a public IP address, or if the subnet is a private subnet with a route that sends internet traffic to a public NAT device.
- This Automation works with instances running Windows Server 2008 R2, Windows Server 2012 R2, Windows Server 2016, and Windows Server 2019.
- Verify that the instance has 20 GB of free disk space in the boot disk.
- If the instance does not use a Windows license provided by AWS, then specify an Amazon EBS snapshot ID that includes Windows Server 2012 R2 installation media. To do this:
 1. Verify that the Amazon EC2 instance is running Windows Server 2012 or later.
 2. Create a 6 GB Amazon EBS volume in the same Availability Zone where the instance is running. Attach the volume to the instance. Mount it, for example, as drive D.
 3. Right-click the ISO and mount it to an instance as, for example, drive E.
 4. Copy the content of the ISO from drive E:\ to drive D:\
 5. Create an Amazon EBS snapshot of the 6 GB volume created in step 2 above.

Windows Server upgrade limitations

This automation doesn't support upgrading Windows domain controllers, clusters, or Windows desktop operating systems. In addition, this automation doesn't support Amazon EC2 instances for Windows Server with the following roles installed:

- Remote Desktop Session Host (RDSH)
- Remote Desktop Connection Broker (RDCB)
- Remote Desktop Virtualization Host (RDVH)
- Remote Desktop Web Access (RDWA)

Steps to perform an automated upgrade of Windows Server

Follow these steps to upgrade your Windows Server instance using the [AWSEC2-CloneInstanceAndUpgradeWindows](#) automation runbook.

1. Open Systems Manager from the **AWS Management Console**.
2. From the left navigation pane, under **Change Management**, choose **Automation**.

3. Choose **Execute automation**.
4. Search for the automation document called AWSEC2-CloneInstanceAndUpgradeWindows.
5. When the document name appears, select it. When you select it, the document details appear.
6. Choose **Execute automation** to input the parameters for this document. Leave **Simple execution** selected at the top of the page.
7. Enter the requested parameters based on the following guidance.

- InstanceID

Type: String

(Required) The instance running Windows Server 2008 R2, 2012 R2, 2016, or 2019 with the SSM agent installed.

- InstanceProfile.

Type: String

(Required) The IAM instance profile. This is the IAM role used to perform the Systems Manager automation against the Amazon EC2 instance and AWS AMIs. For more information, see [Create an IAM Instance Profile for Systems Manager](#) in the *AWS Systems Manager User Guide*.

- TargetWindowsVersion

Type: String

(Required) Select the target Windows version.

- SubnetId

Type: String

(Required) This is the subnet for the upgrade process and where your source EC2 instance resides. Verify that the subnet has outbound connectivity to AWS services, including Amazon S3, and also to Microsoft (in order to download patches).

- KeepPreUpgradedBackUp

Type: String

(Optional) If this parameter is set to `true`, the automation retains the image created from the instance. The default setting is `false`.

- `RebootInstanceBeforeTakingImage`

Type: String

(Optional) The default is `false` (no reboot). If this parameter is set to `true`, Systems Manager reboots the instance before creating an AMI for the upgrade.

8. After you have entered the parameters, choose **Execute**. When the automation begins, you can monitor the execution progress.
9. When the automation completes, you will see the AMI ID. You can launch the AMI to verify that the Windows OS is upgraded.

 **Note**

It is not necessary for the automation to run all of the steps. The steps are conditional based on the behavior of the automation and instance. Systems Manager might skip some steps that are not required.

Additionally, some steps may time out. Systems Manager attempts to upgrade and install all of the latest patches. Sometimes, however, patches time out based on a definable timeout setting for the given step. When this happens, the Systems Manager automation continues to the next step to ensure that the internal OS is upgraded to the target Windows Server version.

10. After the automation completes, you can launch an Amazon EC2 instance using the AMI ID to review your upgrade. For more information about how to create an Amazon EC2 instance from an AWS AMI, see [How do I launch an EC2 instance from a custom Amazon Machine Image \(AMI\)?](#)

Upgrade SQL Server

The [AWSEC2-CloneInstanceAndUpgradeSQLServer](#) script creates an AMI from an Amazon EC2 instance running SQL Server in your account, and then upgrades the AMI to a later version of SQL Server. This multi-step process can take up to two hours to complete.

In this workflow, the automation creates an AMI from the instance and then launches the new AMI in the subnet you provide. The automation then performs an in-place upgrade of SQL Server.

After the upgrade is complete, the automation creates a new AMI before terminating the upgraded instance.

There are two AMIs included in the automated upgrade process:

- **Current running instance.** The first AMI is the current running instance, which is not upgraded. This AMI is used to launch another instance to run the in-place upgrade. When the process is complete, this AMI is deleted from your account, unless you specifically request to keep the original instance. This setting is handled by the parameter `KeepPreUpgradeImageBackUp` (default value is `false`, which means the AMI is deleted by default).
- **Upgraded AMI.** This AMI is the outcome of the automation process.

The final result is one AMI, which is the upgraded instance of the AMI.

When the upgrade is complete, you can test your application functionality by launching the new AMI in your Amazon VPC. After testing, and before you perform another upgrade, schedule application downtime before completely switching to the upgraded instance.

SQL Server automated upgrade paths

The [AWSEC2-CloneInstanceAndUpgradeSQLServer](#) automation runbook supports the following upgrade paths:

- SQL Server 2008 to SQL Server 2017, 2016, or 2014
- SQL Server 2008 R2 to SQL Server 2017, 2016, or 2014
- SQL Server 2012 to SQL Server 2019, 2017, 2016, or 2014
- SQL Server 2014 to SQL Server 2019, 2017, or 2016
- SQL Server 2016 to SQL Server 2019 or 2017
- SQL Server 2017 to SQL Server 2019

Prerequisites

In order to automate your SQL Server upgrade with the AWS Systems Manager Automation document, you must perform the following tasks:

- Create an IAM role with the specified IAM policies to allow Systems Manager to perform automation tasks on your Amazon EC2 instances and verify that you meet the prerequisites to

use Systems Manager. For more information, see [Creating a role to delegate permissions to an AWS service](#) in the *AWS Identity and Access Management User Guide*.

- [Select the option for how you want the automation to be run](#). The options for execution are **Simple execution**, **Rate control**, **Multi-account and Region**, and **Manual execution**. For more information about these options, see [Execution options](#).
- The Amazon EC2 instance must use Windows Server 2008 R2 or later and SQL Server 2008 or later.
- Verify that SSM Agent is installed on your instance. For more information, see [Working with SSM Agent on Amazon EC2 instances for Windows Server](#).
- Verify that the instance has enough free disk space:
 - If you are upgrading from Windows Server 2008 R2 to 2012 R2, or from Windows Server 2012 R2 to a later operating system, verify that you have 20 GB of free disk space in the instance boot disk.
 - If you are upgrading from Windows Server 2008 R2 to 2016 or later, verify that the instance has 40 GB of free disk space in the instance boot disk.
- For instances that use a Bring Your Own License (BYOL) SQL Server version, the following additional prerequisites apply:
 - Provide an Amazon EBS snapshot ID that includes the target SQL Server installation media. To do this:
 1. Verify that the Amazon EC2 instance is running Windows Server 2008 R2 or later.
 2. Create a 6 GB Amazon EBS volume in the same Availability Zone where the instance is running. Attach the volume to the instance. Mount it, for example, as drive D.
 3. Right-click the ISO and mount it to an instance as, for example, drive E.
 4. Copy the content of the ISO from drive E:\ to drive D:\
 5. Create an Amazon EBS snapshot of the 6 GB volume created in step 2.

SQL Server automated upgrade limitations

The following limitations apply when using the [AWSEC2-CloneInstanceAndUpgradeSQLServer](#) runbook to perform an automated upgrade:

- The upgrade can be performed on only a SQL Server using Windows authentication.
- Verify that no security patch updates are pending on the instances. Open **Control Panel**, then choose **Check for updates**.

- SQL Server deployments in HA and mirroring mode are not supported.

Steps to perform an automated upgrade of SQL Server

Follow these steps to upgrade your SQL Server using the [AWSEC2-CloneInstanceAndUpgradeSQLServer](#) automation runbook.

1. If you haven't already, download the SQL Server 2016 .iso file and mount it to the source server.
2. After the .iso file is mounted, copy all of the component files and place them on any volume of your choice.
3. Take an Amazon EBS snapshot of the volume and copy the snapshot ID onto a clipboard for later use. For more information about creating an EBS snapshot, see [Create Amazon EBS snapshots](#).
4. Attach the instance profile to the Amazon EC2 source instance. This allows Systems Manager to communicate with the EC2 instance and run commands on it after it is added to the AWS Systems Manager service. For this example, we named the role SSM-EC2-Profile-Role with the AmazonSSMManagedInstanceCore policy attached to the role. See [Create an IAM instance profile for Systems Manager](#) in the *AWS Systems Manager User Guide*.
5. In the AWS Systems Manager console, in the left navigation pane, choose **Managed Instances**. Verify that your EC2 instance is in the list of managed instance. If you don't see your instance after a few minutes, see [Where Are My Instances?](#) in the *AWS Systems Manager User Guide*.
6. In the left navigation pane, under **Change Management** choose **Automation**.
7. Choose **Execute automation**.
8. Search for the automation document called AWSEC2-CloneInstanceAndUpgradeSQLServer.
9. Choose the AWSEC2-CloneInstanceAndUpgradeSQLServer SSM document, and then choose **Next**.
10. Ensure that the **Simple execution** option is selected.
11. Enter the requested parameters based on the following guidance.

- InstanceId

Type: String

(Required) The instance running SQL Server 2008 R2 (or later).

- **IamInstanceProfile**

Type: String

(Required) The IAM instance profile.

- **SQLServerSnapshotId**

Type: String

(Required) The Snapshot ID for the target SQL Server installation media. This parameter is not required for SQL Server license-included instances.

- **SubnetId**

Type: String

(Required) This is the subnet for the upgrade process and where your source EC2 instance resides. Verify that the subnet has outbound connectivity to AWS services, including Amazon S3, and also to Microsoft (in order to download patches).

- **KeepPreUpgradedBackUp**

Type: String

(Optional) If this parameter is set to `true`, the automation retains the image created from the instance. The default setting is `false`.

- **RebootInstanceBeforeTakingImage**

Type: String

(Optional) The default is `false` (no reboot). If this parameter is set to `true`, Systems Manager reboots the instance before creating an AMI for the upgrade.

- **TargetSQLVersion**

Type: String

(Optional) The target SQL Server version. The default is 2016.

12. After you have entered the parameters, choose **Execute**. When the automation begins, you can monitor the execution progress.
13. When **Execution status** shows **Success**, expand **Outputs** to view the AMI information. You can use the AMI ID to launch your SQL Server instance for the VPC of your choice.

14. Open the Amazon EC2 console. In the left navigation pane, choose **AMIs**. You should see the new AMI.
15. To verify that the new SQL Server version has been successfully installed, choose the new AMI and choose **Launch**.
16. Choose the type of instance that you want for the AMI, the VPC and subnet that you want to deploy to, and the storage that you want to use. Because you're launching the new instance from an AMI, the volumes are presented to you as an option to include within the new EC2 instance you are launching. You can remove any of these volumes, or you can add volumes.
17. Add a tag to help you identify your instance.
18. Add the security group or groups to the instance.
19. Choose **Launch Instance**.
20. Choose the tag name for the instance and select **Connect** under the **Actions** dropdown.
21. Verify that the new SQL Server version is the database engine on the new instance.

Migrate to latest generation instance types

The AWS Windows AMIs are configured with the default settings used by the Microsoft installation media, with some customizations. The customizations include drivers and configurations that support the latest generation instance types, which are [instances built on the AWS Nitro System](#), such as an M5 or C5.

When migrating to Nitro-based instances, including bare metal instances, we recommend that you follow the steps in this topic in the following cases:

- If you are launching instances from custom Windows AMIs
- If you are launching instances from Windows AMIs provided by Amazon that were created before August 2018

For more information, see [Amazon EC2 Update — Additional Instance Types, Nitro System, and CPU Options](#).

Note

The following migration procedures can be performed on Windows Server version 2008 R2 and later. To migrate Linux instances to the latest generation instance types, see [Change the instance type](#).

Contents

- [Part 1: Install and upgrade AWS PV drivers](#)
- [Part 2: Install and upgrade ENA](#)
- [Part 3: Upgrade AWS NVMe drivers](#)
- [Part 4: Update EC2Config and EC2Launch](#)
- [Part 5: Install the serial port driver for bare metal instances](#)
- [Part 6: Update power management settings](#)
- [Part 7: Update Intel chipset drivers for new instance types](#)
- [\(Alternative\) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager](#)
- [Migrate to Xen instance types from Nitro instance types](#)

Note

Alternatively, you can use the `AWSsupport-UpgradeWindowsAWSDrivers` automation document to automate the procedures described in Part 1, Part 2, and Part 3. If you choose to use the automated procedure, see [\(Alternative\) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager](#), and then continue with Part 4 and Part 5.

Before you begin

This procedure assumes that you are currently running on a previous generation Xen-based instance type, such as an M4 or C4, and you are migrating to an [instance built on the AWS Nitro System](#).

You must use PowerShell version 3.0 or later to successfully perform the upgrade.

Note

When migrating to the latest generation instances, the static IP or custom DNS network settings on the existing ENI may be lost as the instance will default to a new Enhanced Networking Adapter device.

Before following the steps in this procedure, we recommend that you create a backup of the instance. From the [EC2 console](#), choose the instance that requires the migration, open the context (right-click) menu, and choose **Instance State, Stop**.

Warning

When you stop an instance, the data on any instance store volumes is erased. To preserve data on instance store volumes, ensure that you back up the data to persistent storage.

Open the context (right-click) menu for the instance in the [EC2 console](#), choose **Image**, and then choose **Create Image**.

Note

Parts 4 and 5 of these instructions can be completed after you migrate or change the instance type to the latest generation. However, we recommend that you complete them before you migrate if you are migrating specifically to a bare metal instance type.

Part 1: Install and upgrade AWS PV drivers

Though AWS PV drivers are not used in the Nitro system, you should still upgrade them if you are on previous versions of either Citrix PV or AWS PV. The latest AWS PV drivers resolve bugs in previous versions of the drivers that may appear while you are on a Nitro system, or if you need to migrate back to a Xen-based instance. As a best practice, we recommend always updating to the latest drivers for Windows instances on AWS.

Use the following procedure to perform an in-place upgrade of AWS PV drivers, or to upgrade from Citrix PV drivers to AWS PV drivers on Windows Server 2008 R2, Windows Server 2012, Windows Server 2012 R2, Windows Server 2016, or Windows Server 2019. For more information, see [Upgrade PV drivers on Windows instances](#).

To upgrade a Domain Controller, see [Upgrade a domain controller \(AWS PV upgrade\)](#).

To perform an upgrade of or to AWS PV drivers

1. Connect to the instance using Remote Desktop and prepare the instance for upgrade. Take all non-system disks offline before you perform the upgrade. If you are performing an in-place update of AWS PV drivers, this step is not required. Set non-essential services to **Manual** start-up in the Services console.
2. [Download](#) the latest driver package to the instance.
3. Extract the contents of the folder and run `AWSVPDriverSetup.msi`.

After running the MSI, the instance automatically reboots and upgrades the driver. The instance may not be available for up to 15 minutes.

After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, connect to the instance using Remote Desktop and verify that the new driver was installed. In Device Manager, under **Storage Controllers**, locate **AWS PV Storage Host Adapter**. Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see [AWS PV driver package history](#).

Part 2: Install and upgrade ENA

Upgrade to the latest Elastic Network Adapter driver to ensure that all network features are supported. If you launched your instance and it does not have enhanced networking already enabled, you must download and install the required network adapter driver on your instance. Then, set the `enaSupport` instance attribute to **activate enhanced networking**. You can only enable this attribute on supported instance types and only if the ENA driver is installed. For more information, see [Enable enhanced networking with the Elastic Network Adapter \(ENA\) on Windows instances](#).

1. [Download](#) the latest driver to the instance.
2. Extract the zip archive.
3. Install the driver by running the `install.ps1` PowerShell script from the extracted folder.

Note

To avoid installation errors, run the `install.ps1` script as an administrator.

4. Check if your AMI has enaSupport activated. If not, continue by following the documentation at [Enable enhanced networking with the Elastic Network Adapter \(ENA\) on Windows instances.](#)

Part 3: Upgrade AWS NVMe drivers

AWS NVMe drivers are used to interact with Amazon EBS and SSD instance store volumes that are exposed as NVMe block devices in the Nitro system for better performance.

Important

The following instructions are modified specifically for when you install or upgrade AWS NVMe on a previous generation instance with the intention to migrate the instance to the latest generation instance type.

1. [Download](#) the latest driver package to the instance.
2. Extract the zip archive.
3. Install the driver by running dpinst.exe.
4. Open a **PowerShell** session and run the following command:

```
PS C:\> start rundll32.exe sppnp.dll,Sysprep_Generalize_Pnp -wait
```

Note

To apply the command, you must run the PowerShell session as an administrator.

PowerShell (x86) versions will result in an error.

This command only runs sysprep on the device drivers. It does not run the full sysprep preparation.

5. For Windows Server 2008 R2 and Windows Server 2012, shut down the instance, change the instance type to a latest generation instance and start it, then proceed to Part 4. If you start the instance again on a previous generation instance type before migrating to a latest generation instance type, it will not boot. For other supported Windows AMIs, you can change the instance type anytime after the device sysprep.

Part 4: Update EC2Config and EC2Launch

For Windows instances, the latest EC2Config and EC2Launch utilities provide additional functionality and information when running on the Nitro system, including on EC2 Bare Metal. By default, the EC2Config service is included in AMIs prior to Windows Server 2016. EC2Launch replaces EC2Config on Windows Server 2016 and later AMIs.

When the EC2Config and EC2Launch services are updated, new Windows AMIs from AWS include the latest version of the service. However, you must update your own Windows AMIs and instances with the latest version of EC2Config and EC2Launch.

To install or update EC2Config

1. Download and unzip the [EC2Config Installer](#).
2. Run EC2Install.exe. For a complete list of options, run EC2Install with the /? option. By default, setup displays prompts. To run the command with no prompts, use the /quiet option.

For more information, see [Install the latest version of EC2Config](#).

To install or update EC2Launch

1. If you have already installed and configured EC2Launch on an instance, make a backup of the EC2Launch configuration file. The installation process does not preserve changes in this file. By default, the file is located in the C:\ProgramData\Amazon\EC2-Windows\Launch\Config directory.
2. Download [EC2-Windows-Launch.zip](#) to a directory on the instance.
3. Download [install.ps1](#) to the same directory where you downloaded EC2-Windows-Launch.zip.
4. Run install.ps1.

 **Note**

To avoid installation errors, run the install.ps1 script as an administrator.

5. If you made a backup of the EC2Launch configuration file, copy it to the C:\ProgramData\Amazon\EC2-Windows\Launch\Config directory.

For more information, see [Configure a Windows instance using EC2Launch](#).

Part 5: Install the serial port driver for bare metal instances

The i3.metal instance type uses a PCI-based serial device rather than an I/O port-based serial device. The latest Windows AMIs automatically use the PCI-based serial device and have the serial port driver installed. If you are not using an instance launched from an Amazon-provided Windows AMI dated 2018.04.11 or later, you must install the Serial Port Driver to enable the serial device for EC2 features such as Password Generation and Console Output. The latest EC2Config and EC2Launch utilities also support i3.metal and provide additional functionality. Follow the steps in Part 4, if you have not yet done so.

To install the serial port driver

1. [Download](#) the serial driver package to the instance.
2. Extract the contents of the folder, open the context (right-click) menu for `aws_ser.INF`, and choose **install**.
3. Choose **Okay**.

Part 6: Update power management settings

The following update to power management settings sets displays to never turn off, which allows for graceful OS shutdowns on the Nitro system. All Windows AMIs provided by Amazon as of 2018.11.28 already have this default configuration.

1. Open a command prompt or PowerShell session.
2. Run the following commands:

```
powercfg /setacvalueindex 381b4222-f694-41f0-9685-ff5bb260df2e 7516b95f-f776-4464-8c53-06167f40cc99 3c0bc021-c8a8-4e07-a973-6b14cbcb2b7e 0  
powercfg /setacvalueindex 8c5e7fda-e8bf-4a96-9a85-a6e23a8c635c 7516b95f-f776-4464-8c53-06167f40cc99 3c0bc021-c8a8-4e07-a973-6b14cbcb2b7e 0  
powercfg /setacvalueindex a1841308-3541-4fab-bc81-f71556f20b4a 7516b95f-f776-4464-8c53-06167f40cc99 3c0bc021-c8a8-4e07-a973-6b14cbcb2b7e 0
```

Part 7: Update Intel chipset drivers for new instance types

The u-6tb1.metal, u-9tb1.metal, and u-12tb1.metal instance types use hardware that requires chipset drivers that were not previously installed on Windows AMIs. If you are not using an instance launched from an Amazon-provided Windows AMI dated 2018.11.19 or later, you must install the drivers using the Intel Chipset INF Utility.

To install the chipset drivers

1. [Download the chipset utility](#) to the instance.
2. Extract the files.
3. Run SetupChipset.exe.
4. Accept the Intel software license agreement and install the chipset drivers.
5. Reboot the instance.

(Alternative) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager

The AWSSupport-UpgradeWindowsAWSDrivers automation document automates the steps described in Part 1, Part 2, and Part 3. This method can also repair an instance where the driver upgrades have failed.

The AWSSupport-UpgradeWindowsAWSDrivers automation document upgrades or repairs storage and network AWS drivers on the specified EC2 instance. The document attempts to install the latest versions of AWS drivers online by calling the AWS Systems Manager Agent (SSM Agent). If SSM Agent is not contactable, the document can perform an offline installation of the AWS drivers if explicitly requested.

Note

This procedure will fail on a domain controller. To update drivers on a domain controller, see [Upgrade a domain controller \(AWS PV upgrade\)](#).

To automatically upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager>.
2. Choose **Automation, Execute Automation**.

3. Search for and then select the **AWS Support - Upgrade Windows AWS Drivers** automation document, and then choose **Execute automation**.
4. In the **Input Parameters** section, configure the following options:

Instance ID

Enter the unique ID of the instance to upgrade.

AllowOffline

(Optional) Choose one of the following options:

- **True** — Choose this option to perform an offline installation. The instance is stopped and restarted during the upgrade process.

Warning

When you stop an instance, the data on any instance store volumes is erased. To preserve data on instance store volumes, ensure that you back up the data to persistent storage.

- **False** — (Default) To perform an online installation, leave this option selected. The instance is restarted during the upgrade process.

Important

Online and offline upgrades create an AMI before attempting the upgrade operations. The AMI persists after the automation completes. Secure your access to the AMI, or delete it if it is no longer needed.

SubnetId

(Optional) Enter one of the following values:

- **SelectedInstanceSubnet** — (Default) The upgrade process launches the *helper* instance into the same subnet as the instance that is to be upgraded. The subnet must allow communication to the Systems Manager endpoints (`ssm.*`).
- **CreateNewVPC** — The upgrade process launches the *helper* instance into a new VPC. Use this option if you're not sure whether the target instance's subnet allows communication to the `ssm.*` endpoints. Your user must have permission to create a VPC.

- A specific subnet ID — Specify the ID of a specific subnet into which to launch the *helper* instance. The subnet must be in the same Availability Zone as the instance that is to be upgraded, and it must allow communication with the ssm.* endpoints.
5. Choose **Execute**.
 6. Allow the upgrade to complete. It could take up to 10 minutes to complete an online upgrade, and up to 25 minutes to complete an offline upgrade.

Migrate to Xen instance types from Nitro instance types

The following procedure assumes that you are currently running on a Nitro-based instance type, and that you are migrating to an instance based on the Xen System, such as M4 or C4. For instance type specifications, see the [Amazon EC2 Instance Types Guide](#). Perform the following steps before the migration to avoid errors during the booting process.

To migrate from Nitro to Xen

1. Back up your data.
2. Verify that your Windows [san policy](#) allows non-root storage volumes to come online.
3. AWS PV drivers must be installed and upgraded on a Nitro instance before you migrate to a Xen instance. For steps to install and upgrade AWS PV drivers, see [Part 1: Install and upgrade AWS PV drivers](#).
4. Update to the latest EC2Launch v2 version. See [Migrate to EC2Launch v2](#) for steps.
5. Open a PowerShell session and run the following command as an administrator to sysprep the device drivers. Running sysprep ensures that early boot storage drivers required for booting on Xen instances are properly registered with Windows.

Note

Running the command using PowerShell (x86) versions will result in an error. This command adds only the boot-critical device drivers to the critical device database. It does not run the full sysprep preparation.

```
Start-Process rundll32.exe sppnp.dll,Sysprep_Generalize_Pnp -wait
```

6. Perform the migration to a Xen instance type when the sysprep process completes.

Windows to Linux replatforming assistant for Microsoft SQL Server databases

For information about replatforming Microsoft SQL Server databases from Windows to Linux, see [Windows to Linux replatforming assistant for Microsoft SQL Server Databases](#) in the *Microsoft SQL Server on Amazon EC2 User Guide*.

Troubleshoot an upgrade

AWS provides upgrade support for issues or problems with the Upgrade Helper Service, an AWS utility that helps you perform in-place upgrades involving Citrix PV drivers.

After the upgrade, the instance might temporarily experience higher than average CPU utilization while the .NET Runtime Optimization service optimizes the .NET framework. This is expected behavior.

If the instance has not passed both status checks after several hours, check the following.

- If you upgraded to Windows Server 2008 and both status checks fail after several hours, the upgrade may have failed and be presenting a prompt to **Click OK** to confirm rolling back. Because the console is not accessible at this state, there is no way to click the button. To get around this, perform a reboot via the Amazon EC2 console or API. The reboot takes ten minutes or more to initiate. The instance might become available after 25 minutes.
- Remove applications or server roles from the server and try again.

If the instance does not pass both status checks after removing applications or server roles from the server, do the following.

- Stop the instance and attach the root volume to another instance. For more information, see the description of how to stop and attach the root volume to another instance in "[Waiting for the metadata service](#)".
- Analyze [Windows Setup log files and event logs](#) for failures.

For other issues or problems with an operating system upgrade or migration, we recommend reviewing the articles listed in [Before you begin an in-place upgrade](#).

Identify EC2 Windows instances

You might need to determine whether your application is running on an EC2 instance.

For information about identifying Linux instances, see [Identify EC2 Linux instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

Inspect the instance identity document

For a definitive and cryptographically verified method of identifying an EC2 instance, check the instance identity document, including its signature. These documents are available on every EC2 instance at the local, non-routable address `http://169.254.169.254/latest/dynamic/instance-identity/`. For more information, see [Instance identity documents](#).

Inspect the system UUID

You can get the system UUID and look for the presence of the characters "EC2" in the beginning octet of the UUID. This method to determine whether a system is an EC2 instance is quick but potentially inaccurate because there is a small chance that a system that is not an EC2 instance could have a UUID that starts with these characters. Furthermore, EC2 instances using SMBIOS 2.4 might represent the UUID in little-endian format, therefore the "EC2" characters do not appear at the beginning of the UUID.

Example : Get the UUID using WMI or Windows PowerShell

Use the Windows Management Instrumentation command line (WMIC) as follows:

```
wmic path win32_computersystemproduct get uuid
```

Alternatively, if you're using Windows PowerShell, use the **Get-WmiObject** cmdlet as follows:

```
PS C:\> Get-WmiObject -query "select uuid from Win32_ComputerSystemProduct" | Select  
UUID
```

In the following example output, the UUID starts with "EC2", which indicates that the system is probably an EC2 instance.

```
EC2AE145-D1DC-13B2-94ED-012345ABCDEF
```

For instances using SMBIOS 2.4, the UUID might be represented in little-endian format; for example:

45E12AEC-DCD1-B213-94ED-012345ABCDEF

Inspect the system virtual machine generation identifier

A virtual machine generation identifier consists of a unique buffer of 128-bit interpreted as cryptographic random integer identifier. You can retrieve the virtual machine generation identifier to identify your Amazon Elastic Compute Cloud instance. The generation identifier is exposed within the guest operating system of the instance through an ACPI table entry. The value will change if your machine is cloned, copied, or imported into AWS, such as with [VM Import/Export](#).

Example : Retrieve the virtual machine generation identifier from Windows

You can create a sample application to retrieve the virtual machine generation identifier from your instances running Windows. For more information, see [Obtaining the virtual machine generation identifier](#) in the Microsoft documentation.

Tutorial: Set up a Windows HPC cluster on Amazon EC2

You can launch a scalable Windows High Performance Computing (HPC) cluster using Amazon EC2 instances. A Windows HPC cluster requires an Active Directory domain controller, a DNS server, a head node, and one or more compute nodes.

To set up a Windows HPC cluster on Amazon EC2, complete the following tasks:

- [Step 1: Create your security groups](#)
- [Step 2: Set up your Active Directory domain controller](#)
- [Step 3: Configure your head node](#)
- [Step 4: Set up the compute node](#)
- [Step 5: Scale your HPC compute nodes \(optional\)](#)

For more information about high performance computing, see [High Performance Computing \(HPC\) on AWS](#).

Prerequisites

You must launch your instances in a VPC. You can use the default VPC or create a nondefault VPC. For more information, see [Getting Started](#) in the *Amazon VPC User Guide*.

Step 1: Create your security groups

Use the Tools for Windows PowerShell to create security groups for the domain controller, domain members, and the HPC cluster.

To create the security groups

1. Use the [New-EC2SecurityGroup](#) cmdlet to create the security group for the domain controller. Note the ID of the security group in the output.

```
PS C:\> New-EC2SecurityGroup -VpcId vpc-id -GroupName "SG - Domain Controller" -  
Description "Active Directory Domain Controller"
```

2. Use the [New-EC2SecurityGroup](#) cmdlet to create the security group for the domain members. Note the ID of the security group in the output.

```
PS C:\> New-EC2SecurityGroup -VpcId vpc-id -GroupName "SG - Domain Member" -  
Description "Active Directory Domain Member"
```

3. Use the [New-EC2SecurityGroup](#) cmdlet to create the security group for the HPC cluster. Note the ID of the security group in the output.

```
PS C:\> New-EC2SecurityGroup -VpcId vpc-id -GroupName "SG - Windows HPC Cluster" -  
Description "Windows HPC Cluster Nodes"
```

To add rules to the security groups

1. Create the following rules to add to the domain controller security group. Replace the placeholder security group ID with the ID of the domain member security group and the placeholder CIDR block with the CIDR block of your network.

```
PS C:\> $sg_dm = New-Object Amazon.EC2.Model.UserIdGroupPair  
PS C:\> $sg_dm.GroupId = "sg-12345678  
PS C:\> $r1 = @{ IpProtocol="UDP"; FromPort="123"; ToPort="123"; UserIdGroupPairs=$sg_dm }
```

```
PS C:\> $r2 = @{ IpProtocol="TCP"; FromPort="135"; ToPort="135"; UserIdGroupPairs=$sg_dm }
PS C:\> $r3 = @{ IpProtocol="UDP"; FromPort="138"; ToPort="138"; UserIdGroupPairs=$sg_dm }
PS C:\> $r4 = @{ IpProtocol="TCP"; FromPort="49152"; ToPort="65535"; UserIdGroupPairs=$sg_dm }
PS C:\> $r5 = @{ IpProtocol="TCP"; FromPort="389"; ToPort="389"; UserIdGroupPairs=$sg_dm }
PS C:\> $r6 = @{ IpProtocol="UDP"; FromPort="389"; ToPort="389"; UserIdGroupPairs=$sg_dm }
PS C:\> $r7 = @{ IpProtocol="TCP"; FromPort="636"; ToPort="636"; UserIdGroupPairs=$sg_dm }
PS C:\> $r8 = @{ IpProtocol="TCP"; FromPort="3268"; ToPort="3269"; UserIdGroupPairs=$sg_dm }
PS C:\> $r9 = @{ IpProtocol="TCP"; FromPort="53"; ToPort="53"; UserIdGroupPairs=$sg_dm }
PS C:\> $r10 = @{ IpProtocol="UDP"; FromPort="53"; ToPort="53"; UserIdGroupPairs=$sg_dm }
PS C:\> $r11 = @{ IpProtocol="TCP"; FromPort="88"; ToPort="88"; UserIdGroupPairs=$sg_dm }
PS C:\> $r12 = @{ IpProtocol="UDP"; FromPort="88"; ToPort="88"; UserIdGroupPairs=$sg_dm }
PS C:\> $r13 = @{ IpProtocol="TCP"; FromPort="445"; ToPort="445"; UserIdGroupPairs=$sg_dm }
PS C:\> $r14 = @{ IpProtocol="UDP"; FromPort="445"; ToPort="445"; UserIdGroupPairs=$sg_dm }
PS C:\> $r15 = @{ IpProtocol="ICMP"; FromPort="-1"; ToPort="-1"; UserIdGroupPairs=$sg_dm }
PS C:\> $r16 = @{ IpProtocol="UDP"; FromPort="53"; ToPort="53"; IpRanges="203.0.113.25/32" }
PS C:\> $r17 = @{ IpProtocol="TCP"; FromPort="3389"; ToPort="3389"; IpRanges="203.0.113.25/32" }
```

2. Use the [Grant-EC2SecurityGroupIngress](#) cmdlet to add the rules to the domain controller security group.

```
PS C:\> Grant-EC2SecurityGroupIngress -GroupId sg-1a2b3c4d -IpPermission @($r1, $r2, $r3, $r4, $r5, $r6, $r7, $r8, $r9, $r10, $r11, $r12, $r13, $r14, $r15, $r16, $r17)
```

For more information about these security group rules, see the following Microsoft article: [How to configure a firewall for domains and trusts](#).

3. Create the following rules to add to the domain member security group. Replace the placeholder security group ID with the ID of the domain controller security group.

```
PS C:\> $sg_dc = New-Object Amazon.EC2.Model.UserIdGroupPair
PS C:\> $sg_dc.GroupId = "sg-1a2b3c4d
PS C:\> $r1 = @{ IpProtocol="TCP"; FromPort="49152"; ToPort="65535";
    UserIdGroupPairs=$sg_dc }
PS C:\> $r2 = @{ IpProtocol="UDP"; FromPort="49152"; ToPort="65535";
    UserIdGroupPairs=$sg_dc }
PS C:\> $r3 = @{ IpProtocol="TCP"; FromPort="53"; ToPort="53"; UserIdGroupPairs=
$sg_dc }
PS C:\> $r4 = @{ IpProtocol="UDP"; FromPort="53"; ToPort="53"; UserIdGroupPairs=
$sg_dc }
```

4. Use the [Grant-EC2SecurityGroupIngress](#) cmdlet to add the rules to the domain member security group.

```
PS C:\> Grant-EC2SecurityGroupIngress -GroupId sg-12345678 -IpPermission @(
    $r1,
    $r2, $r3, $r4 )
```

5. Create the following rules to add to the HPC cluster security group. Replace the placeholder security group ID with the ID of the HPC cluster security group and the placeholder CIDR block with the CIDR block of your network.

```
$sg_hpc = New-Object Amazon.EC2.Model.UserIdGroupPair
PS C:\> $sg_hpc.GroupId = "sg-87654321
PS C:\> $r1 = @{ IpProtocol="TCP"; FromPort="80"; ToPort="80"; UserIdGroupPairs=
$sg_hpc }
PS C:\> $r2 = @{ IpProtocol="TCP"; FromPort="443"; ToPort="443"; UserIdGroupPairs=
$sg_hpc }
PS C:\> $r3 = @{ IpProtocol="TCP"; FromPort="1856"; ToPort="1856";
    UserIdGroupPairs=$sg_hpc }
PS C:\> $r4 = @{ IpProtocol="TCP"; FromPort="5800"; ToPort="5800";
    UserIdGroupPairs=$sg_hpc }
PS C:\> $r5 = @{ IpProtocol="TCP"; FromPort="5801"; ToPort="5801";
    UserIdGroupPairs=$sg_hpc }
PS C:\> $r6 = @{ IpProtocol="TCP"; FromPort="5969"; ToPort="5969";
    UserIdGroupPairs=$sg_hpc }
PS C:\> $r7 = @{ IpProtocol="TCP"; FromPort="5970"; ToPort="5970";
    UserIdGroupPairs=$sg_hpc }
PS C:\> $r8 = @{ IpProtocol="TCP"; FromPort="5974"; ToPort="5974";
    UserIdGroupPairs=$sg_hpc }
```

```
PS C:\> $r9 = @{ IpProtocol="TCP"; FromPort="5999"; ToPort="5999";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r10 = @{ IpProtocol="TCP"; FromPort="6729"; ToPort="6730";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r11 = @{ IpProtocol="TCP"; FromPort="7997"; ToPort="7997";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r12 = @{ IpProtocol="TCP"; FromPort="8677"; ToPort="8677";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r13 = @{ IpProtocol="TCP"; FromPort="9087"; ToPort="9087";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r14 = @{ IpProtocol="TCP"; FromPort="9090"; ToPort="9092";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r15 = @{ IpProtocol="TCP"; FromPort="9100"; ToPort="9163";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r16 = @{ IpProtocol="TCP"; FromPort="9200"; ToPort="9263";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r17 = @{ IpProtocol="TCP"; FromPort="9794"; ToPort="9794";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r18 = @{ IpProtocol="TCP"; FromPort="9892"; ToPort="9893";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r19 = @{ IpProtocol="UDP"; FromPort="9893"; ToPort="9893";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r20 = @{ IpProtocol="TCP"; FromPort="6498"; ToPort="6498";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r21 = @{ IpProtocol="TCP"; FromPort="7998"; ToPort="7998";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r22 = @{ IpProtocol="TCP"; FromPort="8050"; ToPort="8050";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r23 = @{ IpProtocol="TCP"; FromPort="5051"; ToPort="5051";
  UserIdGroupPairs=$sg_hpc }
PS C:\> $r24 = @{ IpProtocol="TCP"; FromPort="3389"; ToPort="3389";
  IpRanges="203.0.113.25/32" }
```

6. Use the [Grant-EC2SecurityGroupIngress](#) cmdlet to add the rules to the HPC cluster security group.

```
PS C:\> Grant-EC2SecurityGroupIngress -GroupId sg-87654321 -IpPermission @(
  $r1,
  $r2, $r3, $r4, $r5, $r6, $r7, $r8, $r9, $r10, $r11, $r12, $r13, $r14, $r15, $r16,
  $r17, $r18, $r19, $r20, $r21, $r22, $r23, $r24 )
```

For more information about these security group rules, see the following Microsoft article: [HPC Cluster Networking: Windows Firewall configuration](#).

7. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
8. In the navigation pane, choose **Security Groups**. Verify that the all three security groups appear in the list and have the required rules.

Step 2: Set up your Active Directory domain controller

The Active Directory domain controller provides authentication and centralized resource management of the HPC environment and is required for the installation. To set up your Active Directory, launch an instance to serve as the domain controller for your HPC cluster and configure it.

To launch a domain controller for your HPC cluster

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the console dashboard, choose **Launch Instance**.
3. On the **Choose an AMI** page, select an AMI for Windows Server, and choose **Select**.
4. On the next page of the wizard, select an instance type, then choose **Next: Configure Instance Details**.
5. On the **Configure Instance Details** page, select your VPC from **Network** and a subnet from **Subnet**. On the next page of the wizard, you can specify additional storage for your instance.
6. On the **Add Tags** page, enter **Domain Controller** as the value for the Name tag for the instance, and then choose **Next: Configure Security Group**.
7. On the **Configure Security Group** page, choose **Select an existing security group**, choose the SG - Domain Controller security group, and then choose **Review and Launch**.
8. Choose **Launch**.
9. In the navigation pane, choose **Elastic IPs**.
10. Choose **Allocate new address**. Choose **Allocate**. Choose **Close**.
11. Select the Elastic IP address you created, and choose **Actions, Associate address**. For **Instance**, choose the domain controller instance. Choose **Associate**.

Connect to the instance you created, and configure the server as a domain controller for the HPC cluster.

To configure your instance as a domain controller

1. Connect to your Domain Controller instance. For more information, see [Connect to your Windows instance](#).
2. Open **Server Manager**, and add the **Active Directory Domain Services** role.
3. Promote the server to a domain controller using Server Manager or by running **DCPromo.exe**.
4. Create a new domain in a new forest.
5. Type **hpc.local** as the fully qualified domain name (FQDN).
6. Select **Forest Functional Level as Windows Server 2008 R2**.
7. Ensure that the **DNS Server** option is selected, and then choose **Next**.
8. Select **Yes, the computer will use an IP address automatically assigned by a DHCP server (not recommended)**.
9. When prompted, choose **Yes** to continue.
10. Complete the wizard and then select **Reboot on Completion**.
11. Connect to the instance as **hpc.local\administrator**.
12. Create a domain user **hpc.local\hpcuser**.

Step 3: Configure your head node

An HPC client connects to the head node. The head node facilitates the scheduled jobs. You configure your head node by launching an instance, installing the HPC Pack, and configuring the cluster.

Launch an instance and then configure it as a member of the hpc.local domain and with the necessary user accounts.

To configure an instance as your head node

1. Launch an instance and name it **HPC-Head**. When you launch the instance, select both of these security groups: SG - Windows HPC Cluster and SG - Domain Member.
2. Connect to the instance and get the existing DNS server address using the following command:

```
IPConfig /all
```

3. Update the TCP/IPv4 properties of the HPC-Head NIC to include the Elastic IP address for the Domain Controller instance as the primary DNS, and then add the additional DNS IP address from the previous step.
4. Join the machine to the hpc.local domain using the credentials for hpc.local\administrator (the domain administrator account).
5. Add hpc.local\hpcuser as the local administrator. When prompted for credentials, use hpc.local\administrator, and then restart the instance.
6. Connect to **HPC-Head** as hpc.local\hpcuser.

To install the HPC Pack

1. Connect to your **HPC-Head** instance using the hpc.local\hpcuser account.
2. Using **Server Manager**, turn off Internet Explorer Enhanced Security Configuration (IE ESC) for Administrators.
 - a. In **Server Manager**, under **Security Information**, choose **Configure IE ESC**.
 - b. Turn off IE ESC for administrators.
3. Install the HPC Pack on **HPC-Head**.
 - a. Download the HPC Pack to HPC-Head from the [Microsoft Download Center](#). Choose the HPC Pack for the version of Windows Server on HPC-Head.
 - b. Extract the files to a folder, open the folder, and double-click **setup.exe**.
 - c. On the Installation page, select **Create a new HPC cluster by creating a head node**, and then choose **Next**.
 - d. Accept the default settings to install all the databases on the Head Node, and then choose **Next**.
 - e. Complete the wizard.

To configure your HPC cluster on the head node

1. Start **HPC Cluster Manager**.
2. In the **Deployment To-Do List**, select **Configure your network**.
 - a. In the wizard, select the default option (5), and then choose **Next**.

- b. Complete the wizard accepting default values on all screens, and choose how you want to update the server and participate in customer feedback.
 - c. Choose **Configure**.
3. Select **Provide Network Credentials**, then provide the hpc.local\hpcuser credentials.
 4. Select **Configure the naming of new nodes**, and then choose **OK**.
 5. Select **Create a node template**.
 - a. Select the **Compute node template**, and then choose **Next**.
 - b. Select **Without operating system**, and then continue with the defaults.
 - c. Choose **Create**.

Step 4: Set up the compute node

You set up the compute node by launching an instance, installing the HPC Pack, and adding the node to your cluster.

First, launch an instance, and then configure it as a member of the hpc.local domain with the necessary user accounts.

To configure an instance for your compute node

1. Launch an instance and name it HPC-Compute. When you launch the instance, select the following security groups: **SG - Windows HPC Cluster** and **SG - Domain Member**.
2. Log in to the instance and get the existing DNS server address from **HPC-Compute** using the following command:

```
IPConfig /all
```

3. Update the TCP/IPv4 properties of the HPC-Compute NIC to include the Elastic IP address of the Domain Controller instance as the primary DNS. Then add the additional DNS IP address from the previous step.
4. Join the machine to the hpc.local domain using the credentials for hpc.local\administrator (the domain administrator account).
5. Add hpc.local\hpcuser as the local administrator. When prompted for credentials, use hpc.local\administrator, and then restart.
6. Connect to HPC-Compute as hpc.local\hpcuser.

To install the HPC Pack on the compute node

1. Connect to your HPC-Compute instance using the hpc.local\hpcuser account.
2. Using **Server Manager**, turn off Internet Explorer Enhanced Security Configuration (IE ESC) for Administrators.
 - a. In **Server Manager**, under **Security Information**, choose **Configure IE ESC**.
 - b. Turn off IE ESC for administrators.
3. Install the HPC Pack on HPC-Compute.
 - a. Download the HPC Pack to HPC-Compute from the [Microsoft Download Center](#). Choose the HPC Pack for the version of Windows Server on HPC-Compute.
 - b. Extract the files to a folder, open the folder, and double-click **setup.exe**.
 - c. On the **Installation** page, select **Join an existing HPC cluster by creating a new compute node**, and then choose **Next**.
 - d. Specify the fully-qualified name of the HPC-Head instance, and then choose the defaults.
 - e. Complete the wizard.

To complete your cluster configuration, from the head node, add the compute node to your cluster.

To add the compute node to your cluster

1. Connect to the HPC-Head instance as hpc.local\hpcuser.
2. Open **HPC Cluster Manager**.
3. Select **Node Management**.
4. If the compute node displays in the **Unapproved** bucket, right-click the node that is listed and select **Add Node**.
 - a. Select **Add compute nodes or broker nodes that have already been configured**.
 - b. Select the check box next to the node and choose **Add**.
5. Right-click the node and choose **Bring Online**.

Step 5: Scale your HPC compute nodes (optional)

To scale your compute nodes

1. Connect to the HPC-Compute instance as `hpc.local\hpcuser`.
2. Delete any files you downloaded locally from the HP Pack installation package. (You have already run setup and created these files on your image so they do not need to be cloned for an AMI.)
3. From `C:\Program Files\Amazon\Ec2ConfigService` open the file `sysprep2008.xml`.
4. At the bottom of `<settings pass="specialize">`, add the following section. Make sure to replace `hpc.local`, `password`, and `hpcuser` to match your environment.

```
<component name="Microsoft-Windows-UnattendedJoin" processorArchitecture="amd64"
  publicKeyToken="31bf3856ad364e35"
  language="neutral" versionScope="nonSxS" xmlns:wcm="http://schemas.microsoft.com/
  WMIConfig/2002/State"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <Identification>
    <UnsecureJoin>false</UnsecureJoin>
    <Credentials>
      <Domain>hpc.local</Domain>
      <Password>password</Password>
      <Username>hpcuser</Username>
    </Credentials>
    <JoinDomain>hpc.local</JoinDomain>
  </Identification>
</component>
```

5. Save `sysprep2008.xml`.
6. Choose **Start, All Programs, EC2ConfigService Settings**.
 - a. Choose the **General** tab, and clear the **Set Computer Name** check box.
 - b. Choose the **Bundle** tab, and then choose **Run Sysprep and Shutdown Now**.
7. Open the Amazon EC2 console.
8. In the navigation pane, choose **Instances**.
9. Wait for the instance status to show **Stopped**.
10. Select the instance, choose **Actions, Image and templates, Create image**.

11. Specify an image name and image description, and then choose **Create image** to create an AMI from the instance.
12. Start the original HPC-Compute instance that was shut down.
13. Connect to the head node using the `hpc.local\hpcuser` account.
14. From **HPC Cluster Manager**, delete the old node that now appears in an error state.
15. In the Amazon EC2 console, in the navigation pane, choose **AMIs**.
16. Use the AMI you created to add additional nodes to the cluster.

You can launch additional compute nodes from the AMI that you created. These nodes are automatically joined to the domain, but you must add them to the cluster as already configured nodes in **HPC Cluster Manager** using the head node and then bring them online.

EC2 Fleet and Spot Fleet

EC2 Fleet and Spot Fleet are designed to be a useful way to launch a fleet—or group—of instances with AWS. Each instance in a fleet is based on a [launch template](#).

Fleets provide the following features and benefits. These benefits make it possible for you to maximize cost savings and optimize availability and performance when running applications on multiple EC2 instances.

Multiple instance types and purchase options

In a single API call, a fleet can launch multiple instance types and purchase options (Spot and On-Demand Instances), allowing you to optimize costs through Spot Instance usage. You can also take advantage of Reserved Instance and Savings Plan discounts by using them in conjunction with On-Demand Instances in the fleet.

Distributing instances across Availability Zones

A fleet automatically attempts to distribute instances evenly across multiple Availability Zones for high availability. This provides resiliency in case an Availability Zone becomes unavailable. As an added benefit, you can access a deeper Amazon EC2 capacity pool when compared to fleets in a single Availability Zone.

Automated replacement of Spot Instances

If your fleet includes Spot Instances, it can automatically request replacement Spot capacity if your Spot Instances are interrupted or become impaired due to a change in instance health. Through Capacity Rebalancing, a fleet can also monitor and proactively replace your Spot Instances that are at an elevated risk of interruption.

As a general best practice, we recommend launching fleets of Spot and On-Demand Instances with Amazon EC2 Auto Scaling because it provides additional features you can use to manage your fleet. The list of additional features includes automatic health check replacements for both Spot and On-Demand Instances, application-based health checks, and an integration with Elastic Load Balancing to ensure an even distribution of application traffic to your healthy instances. You can also use Auto Scaling groups when you use AWS services such as Amazon ECS, Amazon EKS (self-managed node groups), and Amazon VPC Lattice. For more information, see the [Amazon EC2 Auto Scaling User Guide](#).

EC2 Fleet is a good option if you require more flexibility for managing aspects of the instance lifecycle or the scaling mechanisms. You can also use Spot Fleet, but we don't recommend that you do because it's a legacy API with no planned investment. However, if you are already using Spot Fleet, you can continue using it. Spot Fleet and EC2 Fleet offer the same core functionality.

Topics

- [EC2 Fleet](#)
- [Spot Fleet](#)

- [Tutorials for EC2 Fleet and Spot Fleet](#)
- [Example configurations for EC2 Fleet and Spot Fleet](#)
- [Fleet quotas](#)

EC2 Fleet

An *EC2 Fleet* contains the configuration information to launch a fleet of instances. In a single API call, a fleet can launch multiple instance types across multiple Availability Zones, using the Spot Instance, On-Demand Instance, Reserved Instance, and Savings Plan purchasing options together. Using EC2 Fleet, you can:

- Define separate Spot and On-Demand capacity targets and the maximum amount you're willing to pay per hour
- Specify the instance types that work best for your applications
- Specify how Amazon EC2 should distribute your fleet capacity within each purchasing option

You can also set a maximum amount per hour that you're willing to pay for your fleet, and EC2 Fleet launches instances until it reaches the maximum amount. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity.

The EC2 Fleet attempts to launch the number of instances that are required to meet the target capacity specified in your request. If you specified a total maximum price per hour, it fulfills the capacity until it reaches the maximum amount that you're willing to pay. The fleet can also attempt to maintain its target Spot capacity if your Spot Instances are interrupted. For more information, see [How Spot Instances work](#).

EC2 Fleet target capacity: 15

Launch template

Instance type: c3.large

On-Demand capacity: 10

Spot capacity: 5

Launch template overrides

c4.large

Weighted capacity: 1

c5.large

Weighted capacity: 2

You can specify an unlimited number of instance types per EC2 Fleet. Those instance types can be provisioned using both Spot and On-Demand purchasing options. You can also specify multiple Availability Zones, specify different maximum Spot prices for each instance, and choose additional Spot options for each fleet. Amazon EC2 uses the specified options to provision capacity when the fleet launches.

While the fleet is running, if Amazon EC2 reclaims a Spot Instance because of a price increase or instance failure, EC2 Fleet can try to replace the instances with any of the instance types that you specify. This makes it easier to regain capacity during a spike in Spot pricing. You can develop a flexible and elastic resourcing strategy for each fleet. For example, within specific fleets, your primary capacity can be On-Demand supplemented with less-expensive Spot capacity if available.

If you have Reserved Instances and you specify On-Demand Instances in your fleet, EC2 Fleet uses your Reserved Instances. For example, if your fleet specifies an On-Demand Instance as c4.large, and you have Reserved Instances for c4.large, you receive the Reserved Instance pricing. The same applies if you use a Savings Plan.

There is no additional charge for using EC2 Fleet. You pay only for the EC2 instances that the fleet launches for you.

Contents

- [EC2 Fleet limitations](#)
- [Burstable performance instances](#)
- [EC2 Fleet request types](#)
- [EC2 Fleet configuration strategies](#)
- [Work with EC2 Fleets](#)

EC2 Fleet limitations

The following limitations apply to EC2 Fleet:

- EC2 Fleet is available only through the [Amazon EC2 API](#), [AWS CLI](#), [AWS SDKs](#), and [AWS CloudFormation](#).
- An EC2 Fleet request can't span AWS Regions. You need to create a separate EC2 Fleet for each Region.
- An EC2 Fleet request can't span different subnets from the same Availability Zone.

Burstable performance instances

If you launch your Spot Instances using a [burstable performance instance type](#), and if you plan to use your burstable performance Spot Instances immediately and for a short duration, with no idle time for accruing CPU credits, we recommend that you launch them in [Standard mode](#) to avoid paying higher costs. If you launch burstable performance Spot Instances in [Unlimited mode](#) and burst CPU immediately, you'll spend surplus credits for bursting. If you use the instance for a short duration, the instance doesn't have time to accrue CPU credits to pay down the surplus credits, and you are charged for the surplus credits when you terminate the instance.

Unlimited mode is suitable for burstable performance Spot Instances only if the instance runs long enough to accrue CPU credits for bursting. Otherwise, paying for surplus credits makes burstable performance Spot Instances more expensive than using other instances. For more information, see [When to use unlimited mode versus fixed CPU](#).

Launch credits are meant to provide a productive initial launch experience for T2 instances by providing sufficient compute resources to configure the instance. Repeated launches of T2 instances to access new launch credits is not permitted. If you require sustained CPU, you can earn

credits (by idling over some period), use [Unlimited mode](#) for T2 Spot Instances, or use an instance type with dedicated CPU.

EC2 Fleet request types

There are three types of EC2 Fleet requests:

instant

If you configure the request type as `instant`, EC2 Fleet places a synchronous one-time request for your desired capacity. In the API response, it returns the instances that launched, along with errors for those instances that could not be launched. For more information, see [Use an EC2 Fleet of type 'instant'](#).

request

If you configure the request type as `request`, EC2 Fleet places an asynchronous one-time request for your desired capacity. Thereafter, if capacity is diminished because of Spot interruptions, the fleet does not attempt to replenish Spot Instances, nor does it submit requests in alternative Spot capacity pools if capacity is unavailable.

maintain

(Default) If you configure the request type as `maintain`, EC2 Fleet places an asynchronous request for your desired capacity, and maintains capacity by automatically replenishing any interrupted Spot Instances.

All three types of requests benefit from an allocation strategy. For more information, see [Allocation strategies for Spot Instances](#).

Use an EC2 Fleet of type 'instant'

The EC2 Fleet of type `instant` is a synchronous one-time request that makes only one attempt to launch your desired capacity. The API response lists the instances that launched, along with errors for those instances that could not be launched. There are several benefits to using an EC2 Fleet of type `instant`, which are described in this article. Example configurations are provided at the end of the article.

For workloads that need a launch-only API to launch EC2 instances, you can use the `RunInstances` API. However, with `RunInstances`, you can only launch On-Demand Instances or Spot Instances, but

not both in the same request. Furthermore, when you use `RunInstances` to launch Spot Instances, your Spot Instance request is limited to one instance type and one Availability Zone. This targets a single Spot capacity pool (a set of unused instances with the same instance type and Availability Zone). If the Spot capacity pool does not have sufficient Spot Instance capacity for your request, the `RunInstances` call fails.

Instead of using `RunInstances` to launch Spot Instances, we recommend that you rather use the `CreateFleet` API with the `type` parameter set to `instant` for the following benefits:

- **Launch On-Demand Instances and Spot Instances in one request.** An EC2 Fleet can launch On-Demand Instances, Spot Instances, or both. The request for Spot Instances is fulfilled if there is available capacity and the maximum price per hour for your request exceeds the Spot price.
- **Increase the availability of Spot Instances.** By using an EC2 Fleet of type `instant`, you can launch Spot Instances following [Spot best practices](#) with the resulting benefits:
 - **Spot best practice: Be flexible about instance types and Availability Zones.**

Benefit: By specifying several instance types and Availability Zones, you increase the number of Spot capacity pools. This gives the Spot service a better chance of finding and allocating your desired Spot compute capacity. A good rule of thumb is to be flexible across at least 10 instance types for each workload and make sure that all Availability Zones are configured for use in your VPC.

- **Spot best practice: Use the capacity-optimized allocation strategy.**

Benefit: The capacity-optimized allocation strategy automatically provisions instances from the most-available Spot capacity pools. Because your Spot Instance capacity is sourced from pools with optimal capacity, this decreases the possibility that your Spot Instances will be interrupted when Amazon EC2 needs the capacity back.

- **Get access to a wider set of capabilities.** For workloads that need a launch-only API, and where you prefer to manage the lifecycle of your instance rather than let EC2 Fleet manage it for you, use the EC2 Fleet of type `instant` instead of the [RunInstances](#) API. EC2 Fleet provides a wider set of capabilities than `RunInstances`, as demonstrated in the following examples. For all other workloads, you should use Amazon EC2 Auto Scaling because it supplies a more comprehensive feature set for a wide variety of workloads, like ELB-backed applications, containerized workloads, and queue processing jobs.

You can use EC2 Fleet of type `instant` to launch instances into Capacity Blocks. For more information, see [Tutorial: Launch instances into Capacity Blocks](#).

AWS services like Amazon EC2 Auto Scaling and Amazon EMR use EC2 Fleet of type *instant* to launch EC2 instances.

Prerequisites for EC2 Fleet of type instant

For the prerequisites for creating an EC2 Fleet, see [EC2 Fleet prerequisites](#).

How instant EC2 Fleet works

When working with an EC2 Fleet of type *instant*, the sequence of events is as follows:

1. Configure the [CreateFleet](#) request type as *instant*. For more information, see [Create an EC2 Fleet](#). Note that after you make the API call, you can't modify it.
2. When you make the API call, EC2 Fleet places a synchronous one-time request for your desired capacity.
3. The API response lists the instances that launched, along with errors for those instances that could not be launched.
4. You can describe your EC2 Fleet, list the instances associated with your EC2 Fleet, and view the history of your EC2 Fleet.
5. After your instances have launched, you can [delete the fleet request](#). When deleting the fleet request, you can also choose to terminate the associated instances, or leave them running.
6. You can terminate the instances at any time.

Examples

The following examples show how to use EC2 Fleet of type *instant* for different use cases. For more information about using the EC2 CreateFleet API parameters, see [CreateFleet](#) in the *Amazon EC2 API Reference*.

Examples

- [Example 1: Launch Spot Instances with the capacity-optimized allocation strategy](#)
- [Example 2: Launch a single Spot Instance with the capacity-optimized allocation strategy](#)
- [Example 3: Launch Spot Instances using instance weighting](#)
- [Example 4: Launch Spot Instances within single Availability zone](#)
- [Example 5: Launch Spot Instances of single instance type within single Availability zone](#)
- [Example 6: Launch Spot Instances only if minimum target capacity can be launched](#)

- [Example 7: Launch Spot Instances only if minimum target capacity can be launched of same Instance Type in a single Availability Zone](#)
- [Example 8: Launch instances with multiple Launch Templates](#)
- [Example 9: Launch Spot Instance with a base of On-Demand Instances](#)
- [Example 10: Launch Spot Instances using capacity-optimized allocation strategy with a base of On-Demand Instances using Capacity Reservations and the prioritized allocation strategy](#)
- [Example 11: Launch Spot Instances using capacity-optimized-prioritized allocation strategy](#)

Example 1: Launch Spot Instances with the capacity-optimized allocation strategy

The following example specifies the parameters required in an EC2 Fleet of type instant: a launch template, target capacity, default purchasing option, and launch template overrides.

- The launch template is identified by its launch template name and version number.
- The 12 launch template overrides specify 4 different instance types and 3 different subnets, each in a separate Availability Zone. Each instance type and subnet combination defines a Spot capacity pool, resulting in 12 Spot capacity pools.
- The target capacity for the fleet is 20 instances.
- The default purchasing option is spot, which results in the fleet attempting to launch 20 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

},
"Type": "instant"
}
```

Example 2: Launch a single Spot Instance with the capacity-optimized allocation strategy

You can optimally launch one Spot Instance at a time by making multiple EC2 Fleet API calls of type `instant`, by setting the `TotalTargetCapacity` to 1.

The following example specifies the parameters required in an EC2 Fleet of type `instant`: a launch template, target capacity, default purchasing option, and launch template overrides. The launch template is identified by its launch template name and version number. The 12 launch template overrides have 4 different instance types and 3 different subnets, each in a separate Availability Zone. The target capacity for the fleet is 1 instance, and the default purchasing option is spot, which results in the fleet attempting to launch a Spot Instance from one of the 12 Spot capacity pools based on the capacity-optimized allocation strategy, to launch a Spot Instance from the most-available capacity pool.

```

    "TotalTargetCapacity": 1,  
    "DefaultTargetCapacityType": "spot"  
},  
"Type": "instant"  
}
```

Example 3: Launch Spot Instances using instance weighting

The following examples use instance weighting, which means that the price is per unit hour instead of per instance hour. Each launch configuration lists a different instance type and a different weight based on how many units of the workload can run on the instance assuming a unit of the workload requires a 15 GB of memory and 4 vCPUs. For example an m5.xlarge (4 vCPUs and 16 GB of memory) can run one unit and is weighted 1, m5.2xlarge (8 vCPUs and 32 GB of memory) can run 2 units and is weighted 2, and so on. The total target capacity is set to 40 units. The default purchasing option is spot, and the allocation strategy is capacity-optimized, which results in either 40 m5.xlarge (40 divided by 1), 20 m5.2xlarge (40 divided by 2), 10 m5.4xlarge (40 divided by 4), 5 m5.8xlarge (40 divided by 8), or a mix of the instance types with weights adding up to the desired capacity based on the capacity-optimized allocation strategy.

For more information, see [EC2 Fleet instance weighting](#).

}
```

Example 5: Launch Spot Instances of single instance type within single Availability zone

You can configure a fleet to launch all instances of the same instance type and in a single Availability Zone by setting the SpotOptions SingleInstanceType to true and SingleAvailabilityZone to true.

The 12 launch template overrides have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity is 20 instances, the default purchasing option is spot, the Spot allocation strategy is capacity-optimized. The EC2 Fleet launches 20 Spot Instances of the same instance type all in a single AZ from the Spot Instance pool with optimal capacity using the launch specifications.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
        "SingleInstanceType": true,
        "SingleAvailabilityZone": true
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "ec2-fleet-lt1",
                "Version": "$Latest"
            },
            "Overrides": [
                {
                    "InstanceType": "c5.4xlarge",
                    "SubnetId": "subnet-fae8c380"
                },
                {
                    "InstanceType": "c5.4xlarge",
                    "SubnetId": "subnet-e7188bab"
                }
            ]
        }
    ]
}
```

```
        },
        {
            "InstanceType": "c5.4xlarge",
            "SubnetId": "subnet-49e41922"
        },
        {
            "InstanceType": "c5d.4xlarge",
            "SubnetId": "subnet-fae8c380"
        },
        {
            "InstanceType": "c5d.4xlarge",
            "SubnetId": "subnet-e7188bab"
        },
        {
            "InstanceType": "c5d.4xlarge",

            "SubnetId": "subnet-e7188bab"
        },
        {
            "InstanceType": "m5d.4xlarge",
            "SubnetId": "subnet-49e41922"
        }
    ]
},
],
]
```

```
"TargetCapacitySpecification": {  
    "TotalTargetCapacity": 20,  
    "DefaultTargetCapacityType": "spot"  
},  
"Type": "instant"  
}
```

Example 6: Launch Spot Instances only if minimum target capacity can be launched

You can configure a fleet to launch instances only if the minimum target capacity can be launched by setting the Spot options MinTargetCapacity to the minimum target capacity you want to launch together.

The 12 launch template overrides have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity and the minimum target capacity are both set to 20 instances, the default purchasing option is spot, the Spot allocation strategy is capacity-optimized. The EC2 Fleet launches 20 Spot Instances from the Spot capacity pool with optimal capacity using the launch template overrides, only if it can launch all 20 instances at the same time.

```
{  
    "SpotOptions": {  
        "AllocationStrategy": "capacity-optimized",  
        "MinTargetCapacity": 20  
    },  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification":{  
                "LaunchTemplateName":"ec2-fleet-lt1",  
                "Version":"$Latest"  
            },  
            "Overrides": [  
                {  
                    "InstanceType":"c5.4xlarge",  
                    "SubnetId":"subnet-fae8c380"  
                },  
                {  
                    "InstanceType":"c5.4xlarge",  
                    "SubnetId":"subnet-e7188bab"  
                },  
                {  
                    "InstanceType":"c5.4xlarge",  
                    "SubnetId":"subnet-0f188bab"  
                }  
            ]  
        }  
    ]  
}
```

```
        "SubnetId": "subnet-49e41922"
    },
    {
        "InstanceType": "c5d.4xlarge",
        "SubnetId": "subnet-fae8c380"
    },
    {
        "InstanceType": "c5d.4xlarge",

}
```

Example 7: Launch Spot Instances only if minimum target capacity can be launched of same Instance Type in a single Availability Zone

You can configure a fleet to launch instances only if the minimum target capacity can be launched with a single instance type in a single Availability Zone by setting the Spot options MinTargetCapacity to the minimum target capacity you want to launch together along with SingleInstanceType and SingleAvailabilityZone options.

The 12 launch specifications which override the launch template, have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity and the minimum target capacity are both set to 20 instances, the default purchasing option is spot, the Spot allocation strategy is capacity-optimized, the SingleInstanceType is true and SingleAvailabilityZone is true. The EC2 Fleet launches 20 Spot Instances of the same Instance type all in a single AZ from the Spot capacity pool with optimal capacity using the launch specifications, only if it can launch all 20 instances at the same time.

```
{
  "SpotOptions": {
    "AllocationStrategy": "capacity-optimized",
    "SingleInstanceType": true,
    "SingleAvailabilityZone": true,
    "MinTargetCapacity": 20
  },
  "LaunchTemplateConfigs": [
    {
      "LaunchTemplateSpecification": {
        "LaunchTemplateName": "ec2-fleet-lt1",
        "Version": "$Latest"
      },
      "Overrides": [
        {
          "InstanceType": "c5.4xlarge",
          "SubnetId": "subnet-fae8c380"
        },
        {
          "InstanceType": "c5.4xlarge",
          "SubnetId": "subnet-e7188bab"
        }
      ]
    }
  ]
}
```

```
{  
    "InstanceType": "c5.4xlarge",  
    "SubnetId": "subnet-49e41922"  
},  
{  
    "InstanceType": "c5d.4xlarge",  
    "SubnetId": "subnet-fae8c380"  
},

Example 8: Launch instances with multiple Launch Templates

You can configure a fleet to launch instances with different launch specifications for different instance types or a group of instance types, by specifying multiple launch templates. In this example we want have different EBS volume sizes for different instance types and we have that configured in the launch templates ec2-fleet-lt-4xl, ec2-fleet-lt-9xl and ec2-fleet-lt-18xl.

In this example, we are using 3 different launch templates for the 3 instance types based on their size. The launch specification overrides on all the launch templates use instance weights based on the vCPUs on the instance type. The total target capacity is 144 units, the default purchasing option is spot, and the Spot allocation strategy is capacity-optimized. The EC2 Fleet can either launch 9 c5n.4xlarge (144 divided by 16) using the launch template ec2-fleet-4xl or 4 c5n.9xlarge (144 divided by 36) using the launch template ec2-fleet-9xl, or 2 c5n.18xlarge (144 divided by 72) using the launch template ec2-fleet-18xl, or a mix of the instance types with weights adding up to the desired capacity based on the capacity-optimized allocation strategy.

Example 9: Launch Spot Instance with a base of On-Demand Instances

The following example specifies the total target capacity of 20 instances for the fleet, and a target capacity of 5 On-Demand Instances. The default purchasing option is spot. The fleet launches 5 On-Demand Instance as specified, but needs to launch 15 more instances to fulfill the total target capacity. The purchasing option for the difference is calculated as `TotalTargetCapacity - OnDemandTargetCapacity = DefaultTargetCapacityType`, which results in the fleet launching 15 Spot Instances from one of the 12 Spot capacity pools based on the capacity-optimized allocation strategy.

}
```

Example 10: Launch Spot Instances using capacity-optimized allocation strategy with a base of On-Demand Instances using Capacity Reservations and the prioritized allocation strategy

You can configure a fleet to use On-Demand Capacity Reservations first when launching a base of On-Demand Instances with the default target capacity type as spot by setting the usage strategy for Capacity Reservations to use-capacity-reservations-first. And if multiple instance pools have unused Capacity Reservations, the chosen On-Demand allocation strategy is applied. In this example, the On-Demand allocation strategy is prioritized.

In this example, there are 6 available unused Capacity Reservations. This is less than the fleet's target On-Demand capacity of 10 On-Demand Instances.

The account has the following 6 unused Capacity Reservations in 2 pools. The number of Capacity Reservations in each pool is indicated by AvailableInstanceCount.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "c5.large",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
}
```

```
"AvailableInstanceCount": 3,  
"InstanceMatchCriteria": "open",  
"State": "active"  
}
```

The following fleet configuration shows only the pertinent configurations for this example. The On-Demand allocation strategy is prioritized, and the usage strategy for Capacity Reservations is use-capacity-reservations-first. The Spot allocation strategy is capacity-optimized. The total target capacity is 20, the On-Demand target capacity is 10, and the default target capacity type is spot.

```
{  
    "SpotOptions": {  
        "AllocationStrategy": "capacity-optimized"  
    },  
    "OnDemandOptions": {  
        "CapacityReservationOptions": {  
            "UsageStrategy": "use-capacity-reservations-first"  
        },  
        "AllocationStrategy": "prioritized"  
    },  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "ec2-fleet-lt1",  
                "Version": "$Latest"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "c5.large",

    },
    {
        "InstanceType": "c5d.large",
        "SubnetId": "subnet-e7188bab",
        "Priority": 5.0
    },
    {
        "InstanceType": "c5d.large",
        "SubnetId": "subnet-49e41922",
        "Priority": 6.0
    },
    {
        "InstanceType": "m5.large",
        "SubnetId": "subnet-fae8c380",
        "Priority": 7.0
    },
    {
        "InstanceType": "m5.large",
        "SubnetId": "subnet-e7188bab",
        "Priority": 8.0
    },
    {
        "InstanceType": "m5.large",
        "SubnetId": "subnet-49e41922",
        "Priority": 9.0
    },
    {
        "InstanceType": "m5d.large",
        "SubnetId": "subnet-fae8c380",
        "Priority": 10.0
    },
    {
        "InstanceType": "m5d.large",
        "SubnetId": "subnet-e7188bab",
        "Priority": 11.0
    },
    {
        "InstanceType": "m5d.large",
        "SubnetId": "subnet-49e41922",
        "Priority": 12.0
    }
}
```

```
        ],
    },
],
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 20,
    "OnDemandTargetCapacity": 10,
    "DefaultTargetCapacityType": "spot"
},
"Type": "instant"
}
```

After you create the instant fleet using the preceding configuration, the following 20 instances are launched to meet the target capacity:

- 7 c5.large On-Demand Instances in us-east-1a – c5.large in us-east-1a is prioritized first, and there are 3 available unused c5.large Capacity Reservations. The Capacity Reservations are used first to launch 3 On-Demand Instances plus 4 additional On-Demand Instances are launched according to the On-Demand allocation strategy, which is prioritized in this example.
- 3 m5.large On-Demand Instances in us-east-1a – m5.large in us-east-1a is prioritized second, and there are 3 available unused c3.large Capacity Reservations.
- 10 Spot Instances from one of the 12 Spot capacity pools that has the optimal capacity according to the capacity-optimized allocation strategy.

After the fleet is launched, you can run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the c5.large and m5.large Capacity Reservations were used.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "c5.large",
    "AvailableInstanceCount": 0
}
```

Example 11: Launch Spot Instances using capacity-optimized-prioritized allocation strategy

The following example specifies the parameters required in an EC2 Fleet of type instant: a launch template, target capacity, default purchasing option, and launch template overrides. The launch template is identified by its launch template name and version number. The 12 launch specifications which override the launch template have 4 different instance types with a priority assigned, and 3 different subnets, each in a separate Availability Zone. The target capacity for the fleet is 20 instances, and the default purchasing option is spot, which results in the fleet attempting to launch 20 Spot Instances from one of the 12 Spot capacity pools based on the capacity-optimized-prioritized allocation strategy, which implements priorities on a best-effort basis, but optimizes for capacity first.

```
{  
    "SpotOptions": {  
        "AllocationStrategy": "capacity-optimized-prioritized"  
    },  
    "LaunchTemplateConfigs": [

```

EC2 Fleet configuration strategies

An *EC2 Fleet* is a group of On-Demand Instances and Spot Instances. EC2 Fleet can also be a group of Capacity Blocks instances.

On-Demand Instances and Spot Instances

The EC2 Fleet attempts to launch the number of instances that are required to meet the target capacity that you specify in the fleet request. The fleet can comprise only On-Demand Instances, only Spot Instances, or a combination of both On-Demand Instances and Spot Instances. The request for Spot Instances is fulfilled if there is available capacity and the maximum price per hour for your request exceeds the Spot price. The fleet also attempts to maintain its target capacity if your Spot Instances are interrupted.

You can also set a maximum amount per hour that you're willing to pay for your fleet, and EC2 Fleet launches instances until it reaches the maximum amount. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity.

A *Spot capacity pool* is a set of unused EC2 instances with the same instance type and Availability Zone. When you create an EC2 Fleet, you can include multiple launch specifications, which vary by instance type, Availability Zone, subnet, and maximum price. The fleet selects the Spot capacity pools that are used to fulfill the request, based on the launch specifications included in your request, and the configuration of the request. The Spot Instances come from the selected pools.

An EC2 Fleet enables you to provision large amounts of EC2 capacity that makes sense for your application based on number of cores or instances, or amount of memory. For example, you can specify an EC2 Fleet to launch a target capacity of 200 instances, of which 130 are On-Demand Instances and the rest are Spot Instances.

Capacity Blocks instances

Capacity Blocks for ML allow you to reserve GPU instances on a future date to support your short duration machine learning (ML) workloads. Instances that run in a Capacity Block are automatically

placed close together inside [Amazon EC2 UltraClusters](#). For more information about Capacity Blocks, see [Capacity Blocks for ML](#).

Use the appropriate configuration strategies to create an EC2 Fleet that meets your needs.

Contents

- [Plan an EC2 Fleet](#)
- [Allocation strategies for Spot Instances](#)
- [Attribute-based instance type selection for EC2 Fleet](#)

Plan an EC2 Fleet

When planning your EC2 Fleet, we recommend that you do the following:

- Determine whether you want to create an EC2 Fleet that submits a synchronous or asynchronous one-time request for the desired target capacity, or one that maintains a target capacity over time. For more information, see [EC2 Fleet request types](#).
- Determine the instance types that meet your application requirements.
- If you plan to include Spot Instances in your EC2 Fleet, review [Spot Best Practices](#) before you create the fleet. Use these best practices when you plan your fleet so that you can provision the instances at the lowest possible price.
- Determine the target capacity for your EC2 Fleet. You can set target capacity in instances or in custom units. For more information, see [EC2 Fleet instance weighting](#).
- Determine what portion of the EC2 Fleet target capacity must be On-Demand capacity and Spot capacity. You can specify 0 for On-Demand capacity or Spot capacity, or both.
- Determine your price per unit, if you are using instance weighting. To calculate the price per unit, divide the price per instance hour by the number of units (or weight) that this instance represents. If you are not using instance weighting, the default price per unit is the price per instance hour.

- Determine the maximum amount per hour that you're willing to pay for your fleet. For more information, see [Control spending](#).
- Review the possible options for your EC2 Fleet. For information about the fleet parameters, see [create-fleet](#) in the *AWS CLI Command Reference*. For EC2 Fleet configuration examples, see [EC2 Fleet example configurations](#).

Allocation strategies for Spot Instances

Your launch configuration determines all the possible Spot capacity pools (instance types and Availability Zones) from which EC2 Fleet can launch Spot Instances. However, when launching instances, EC2 Fleet uses the allocation strategy that you specify to pick the specific pools from all your possible pools.

Allocation strategies

You can specify one of the following allocation strategies for Spot Instances:

price-capacity-optimized (recommended)

EC2 Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. EC2 Fleet then requests Spot Instances from the lowest priced of these pools.

The price-capacity-optimized allocation strategy is the best choice for most Spot workloads, such as stateless containerized applications, microservices, web applications, data and analytics jobs, and batch processing.

capacity-optimized

EC2 Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. You can optionally set a priority for each instance type in your fleet using capacity-optimized-prioritized. EC2 Fleet optimizes for capacity first, but honors instance type priorities on a best-effort basis.

With Spot Instances, pricing changes slowly over time based on long-term trends in supply and demand, but capacity fluctuates in real time. The capacity-optimized strategy automatically launches Spot Instances into the most available pools by looking at real-time capacity data and predicting which are the most available. This works well for workloads that

may have a higher cost of interruption associated with restarting work, such as long Continuous Integration (CI), image and media rendering, Deep Learning, and High Performance Compute (HPC) workloads that may have a higher cost of interruption associated with restarting work. By offering the possibility of fewer interruptions, the capacity-optimized strategy can lower the overall cost of your workload.

Alternatively, you can use the capacity-optimized-prioritized allocation strategy with a priority parameter to order instance types from highest to lowest priority. You can set the same priority for different instance types. EC2 Fleet will optimize for capacity first, but will honor instance type priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect EC2 Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters. Using priorities is supported only if your fleet uses a launch template. Note that when you set the priority for capacity-optimized-prioritized, the same priority is also applied to your On-Demand Instances if the On-Demand AllocationStrategy is set to prioritized.

diversified

The Spot Instances are distributed across all Spot capacity pools.

lowest-price

The Spot Instances come from the lowest priced pool that has available capacity. This is the default strategy. However, we recommend that you override the default by specifying the price-capacity-optimized allocation strategy.

If the lowest priced pool doesn't have available capacity, the Spot Instances come from the next lowest priced pool that has available capacity.

If a pool runs out of capacity before fulfilling your desired capacity, EC2 Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your desired capacity is met, you might receive Spot Instances from several pools.

Because this strategy only considers instance price and not capacity availability, it might lead to high interruption rates.

InstancePoolsToUseCount

The number of Spot pools across which to allocate your target Spot capacity. Valid only when the allocation strategy is set to lowest-price. EC2 Fleet selects the lowest priced Spot

pools and evenly allocates your target Spot capacity across the number of Spot pools that you specify.

Note that EC2 Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, EC2 Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Choose the appropriate allocation strategy

You can optimize your fleet for your use case by choosing the appropriate Spot allocation strategy. For On-Demand Instance target capacity, EC2 Fleet always selects the least expensive instance type based on the public On-Demand price, while following the allocation strategy—either price-capacity-optimized, capacity-optimized, diversified, or lowest-price—for Spot Instances.

Balance lowest price and capacity availability

To balance the trade-offs between the lowest priced Spot capacity pools and the Spot capacity pools with the highest capacity availability, we recommend that you use the price-capacity-optimized allocation strategy. This strategy makes decisions about which pools to request Spot Instances from based on both the price of the pools and the capacity availability of Spot Instances in those pools. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term, while still taking price into consideration.

If your fleet runs resilient and stateless workloads, including containerized applications, microservices, web applications, data and analytics jobs, and batch processing, then use the price-capacity-optimized allocation strategy for optimal cost savings and capacity availability.

If your fleet runs workloads that might have a higher cost of interruption associated with restarting work, then you should implement checkpointing so that applications can restart from that point if they're interrupted. By using checkpointing, you make the price-capacity-optimized allocation strategy a good fit for these workloads because it allocates capacity from the lowest priced pools that also offer a low Spot Instance interruption rate.

For an example configuration that uses the price-capacity-optimized allocation strategy, see [Example 11: Launch Spot Instances in a price-capacity-optimized fleet](#).

When workloads have a high cost of interruption

You can optionally use the capacity-optimized strategy if you run workloads that either use similarly priced instance types, or where the cost of interruption is so significant that any cost saving is inadequate in comparison to a marginal increase in interruptions. This strategy allocates capacity from the most available Spot capacity pools that offer the possibility of fewer interruptions, which can lower the overall cost of your workload. For an example configuration that uses the capacity-optimized allocation strategy, see [Example 9: Launch Spot Instances in a capacity-optimized fleet](#).

When the possibility of interruptions must be minimized but the preference for certain instance types matters, you can express your pool priorities by using the capacity-optimized-prioritized allocation strategy and then setting the order of instance types to use from highest to lowest priority. For an example configuration, see [Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities](#).

Note that using priorities is supported only if your fleet uses a launch template. Also note that when you set priorities for capacity-optimized-prioritized, the same priorities are also applied to your On-Demand Instances if the On-Demand AllocationStrategy is set to prioritized.

When your workload is time flexible and capacity availability is not a factor

If your fleet is small or runs for a short time, you can use price-capacity-optimized to maximize cost savings while still considering capacity availability.

If your workload is time flexible and capacity availability is not a factor, you can optionally use the lowest-price allocation strategy to maximize cost savings. Note, however, that because the lowest-price allocation strategy only considers instance price and not capacity availability, it might lead to high Spot Instance interruption rates.

When your fleet is large or runs for a long time

If your fleet is large or runs for a long time, you can improve the availability of your fleet by distributing the Spot Instances across multiple pools using the diversified strategy. For example, if your EC2 Fleet specifies 10 pools and a target capacity of 100 instances, the fleet launches 10 Spot Instances in each pool. If the Spot price for one pool exceeds your maximum

price for this pool, only 10% of your fleet is affected. Using this strategy also makes your fleet less sensitive to increases in the Spot price in any one pool over time. With the diversified strategy, the EC2 Fleet does not launch Spot Instances into any pools with a Spot price that is equal to or higher than the [On-Demand price](#).

To create an inexpensive and diversified fleet, use the lowest-price strategy in combination with `InstancePoolsToUseCount`. For example, if your target capacity is 10 Spot Instances, and you specify 2 Spot capacity pools (for `InstancePoolsToUseCount`), EC2 Fleet will draw on the two lowest priced pools to fulfill your Spot capacity.

You can use a low or high number of Spot capacity pools across which to allocate your Spot Instances. For example, if you run batch processing, we recommend specifying a low number of Spot capacity pools (for example, `InstancePoolsToUseCount=2`) to ensure that your queue always has compute capacity while maximizing savings. If you run a web service, we recommend specifying a high number of Spot capacity pools (for example, `InstancePoolsToUseCount=10`) to minimize the impact if a Spot capacity pool becomes temporarily unavailable.

Note that EC2 Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, EC2 Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Maintain target capacity

After Spot Instances are terminated due to a change in the Spot price or available capacity of a Spot capacity pool, an EC2 Fleet of type `maintain` launches replacement Spot Instances. The allocation strategy determines the pools from which the replacement instances are launched, as follows:

- If the allocation strategy is `price-capacity-optimized`, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability while also taking price into consideration and identifying lowest priced pools with high capacity availability.
- If the allocation strategy is `capacity-optimized`, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability.
- If the allocation strategy is `diversified`, the fleet distributes the replacement Spot Instances across the remaining pools.

- If the allocation strategy is `lowest-price`, the fleet launches replacement instances in the pool where the Spot price is currently the lowest.
- If the allocation strategy is `lowest-price` in combination with `InstancePoolsToUseCount`, the fleet selects the Spot capacity pools with the lowest price and launches Spot Instances across the number of Spot capacity pools that you specify.

Attribute-based instance type selection for EC2 Fleet

When you create an EC2 Fleet, you must specify one or more instance types for configuring the On-Demand Instances and Spot Instances in the fleet. As an alternative to manually specifying the instance types, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. This is known as *attribute-based instance type selection*. For example, you can specify the minimum and maximum number of vCPUs required for your instances, and EC2 Fleet will launch the instances using any available instance types that meet those vCPU requirements.

Attribute-based instance type selection is ideal for workloads and frameworks that can be flexible about what instance types they use, such as when running containers or web fleets, processing big data, and implementing continuous integration and deployment (CI/CD) tooling.

Benefits

Attribute-based instance type selection has the following benefits:

- **Easily use the right instance types** – With so many instance types available, finding the right instance types for your workload can be time consuming. When you specify instance attributes, the instance types will automatically have the required attributes for your workload.
- **Simplified configuration** – To manually specify multiple instance types for an EC2 Fleet, you must create a separate launch template override for each instance type. But with attribute-based instance type selection, to provide multiple instance types, you need only specify the instance attributes in the launch template or in a launch template override.
- **Automatic use of new instance types** – When you specify instance attributes rather than instance types, your fleet can use newer generation instance types as they're released, "future proofing" the fleet's configuration.
- **Instance type flexibility** – When you specify instance attributes rather than instance types, EC2 Fleet can select from a wide range of instance types for launching Spot Instances, which adheres to the [Spot best practice of instance type flexibility](#).

Topics

- [Price protection](#)
- [Considerations](#)
- [Create an EC2 Fleet with attribute-based instance type selection](#)
- [Examples of configurations that are valid and not valid](#)
- [Preview instance types with specified attributes](#)

How attribute-based instance type selection works

To use attribute-based instance type selection in your fleet configuration, you replace the list of instance types with a list of instance attributes that your instances require. EC2 Fleet will launch instances on any available instance types that have the specified instance attributes.

Topics

- [Types of instance attributes](#)
- [Where to configure attribute-based instance type selection](#)
- [How EC2 Fleet uses attribute-based instance type selection when provisioning a fleet](#)

Types of instance attributes

There are several instance attributes that you can specify to express your compute requirements, such as:

- **vCPU count** – The minimum and maximum number of vCPUs per instance.
- **Memory** – The minimum and maximum GiBs of memory per instance.
- **Local storage** – Whether to use EBS or instance store volumes for local storage.
- **Burstable performance** – Whether to use the T instance family, including T4g, T3a, T3, and T2 types.

For a description of each attribute and the default values, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

Where to configure attribute-based instance type selection

Depending on whether you use the console or the AWS CLI, you can specify the instance attributes for attribute-based instance type selection as follows:

In the console, you can specify the instance attributes in the following fleet configuration component:

- In a launch template, and then reference the launch template in the fleet request

In the AWS CLI, you can specify the instance attributes in one or all of the following fleet configuration components:

- In a launch template, and then reference the launch template in the fleet request
- In a launch template override

If you want a mix of instances that use different AMIs, you can specify instance attributes in multiple launch template overrides. For example, different instance types can use x86 and Arm-based processors.

- In a launch specification

How EC2 Fleet uses attribute-based instance type selection when provisioning a fleet

EC2 Fleet provisions a fleet in the following way:

- EC2 Fleet identifies the instance types that have the specified attributes.
- EC2 Fleet uses price protection to determine which instance types to exclude.
- EC2 Fleet determines the capacity pools from which it will consider launching the instances based on the AWS Regions or Availability Zones that have matching instance types.
- EC2 Fleet applies the specified allocation strategy to determine from which capacity pools to launch the instances.

Note that attribute-based instance type selection does not pick the capacity pools from which to provision the fleet; that's the job of the allocation strategies. There might be a large number of instance types with the specified attributes, and some of them might be expensive. The default allocation strategy of lowest-price for Spot and On-Demand guarantees that EC2 Fleet will launch instances from the least expensive capacity pools.

If you specify an allocation strategy, EC2 Fleet will launch instances according to the specified allocation strategy.

- For Spot Instances, attribute-based instance type selection supports the price-capacity-optimized, capacity-optimized, and lowest-price allocation strategies.
- For On-Demand Instances, attribute-based instance type selection supports the lowest-price allocation strategy.
- If there is no capacity for the instance types with the specified instance attributes, no instances can be launched, and the fleet returns an error.

Price protection

Price protection is a feature that prevents your EC2 Fleet from using instance types that you would consider too expensive even if they happen to fit the attributes that you specified. To use price protection, you set a price threshold. Then, when Amazon EC2 selects instance types with your attributes, it excludes instance types priced above your threshold.

The way that Amazon EC2 calculates the price threshold is as follows:

- Amazon EC2 first identifies the lowest priced instance type from those that match your attributes.
- Amazon EC2 then takes the value (expressed as a percentage) that you specified for the price protection parameter and multiplies it with the price of the identified instance type. The result is the price that is used as the price threshold.

There are separate price thresholds for On-Demand Instances and Spot Instances.

When you create a fleet with attribute-based instance type selection, price protection is enabled by default. You can keep the default values, or you can specify your own.

You can also turn off price protection. To indicate no price protection threshold, specify a high percentage value, such as 999999.

Topics

- [How the lowest priced instance type is identified](#)
- [On-Demand Instance price protection](#)
- [Spot Instance price protection](#)

- [Specify the price protection threshold](#)

How the lowest priced instance type is identified

Amazon EC2 determines the price to base the price threshold on by identifying the instance type with the lowest price from those that match your specified attributes. It does this in the following way:

- It first looks at the current generation C, M, or R instance types that match your attributes. If it finds any matches, it identifies the lowest priced instance type.
- If there is no match, it then looks at any current generation instance types that match your attributes. If it finds any matches, it identifies the lowest priced instance type.
- If there is no match, it then looks at any previous generation instance types that match your attributes, and identifies the lowest priced instance type.

On-Demand Instance price protection

The price protection threshold for On-Demand instance types is calculated *as a percentage higher* than the identified lowest priced On-Demand instance type (`OnDemandMaxPricePercentageOverLowestPrice`). You specify the percentage higher that you're willing to pay. If you don't specify this parameter, then a default value of 20 is used to calculate a price protection threshold of 20% higher than the identified price.

For example, if the identified On-Demand instance price is `0.4271`, and you specify 25, then the price threshold is 25% more than `0.4271`. It is calculated as follows: $0.4271 * 1.25 = 0.533875$. The calculated price is the maximum you're willing to pay for On-Demand Instances, and, in this example, Amazon EC2 will exclude any On-Demand instance types that cost more than `0.533875`.

Spot Instance price protection

By default, Amazon EC2 will automatically apply optimal Spot Instance price protection to consistently select from a wide range of instance types. You can also manually set the price protection yourself. However, letting Amazon EC2 do it for you can improve the likelihood that your Spot capacity is fulfilled.

You can manually specify the price protection using one of the following options. If you manually set the price protection, we recommend using the first option.

- A **percentage of the identified lowest priced On-Demand instance type**

[MaxSpotPriceAsPercentageOfOptimalOnDemandPrice]

For example, if the identified On-Demand instance type price is `0.4271`, and you specify `60`, then the price threshold is 60% of `0.4271`. It is calculated as follows: $0.4271 * 0.60 = 0.25626$. The calculated price is the maximum you're willing to pay for Spot Instances, and, in this example, Amazon EC2 will exclude any Spot instance types that cost more than `0.25626`.

- A **percentage higher than the identified lowest priced Spot instance type**

[SpotMaxPricePercentageOverLowestPrice]

For example, if the identified Spot instance type price is `0.1808`, and you specify `25`, then the price threshold is 25% more than `0.1808`. It is calculated as follows: $0.1808 * 1.25 = 0.226$. The calculated price is the maximum you're willing to pay for Spot Instances, and, in this example, Amazon EC2 will exclude any Spot instance types that cost more than `0.226`. We do not recommend using this parameter because Spot prices can fluctuate, and therefore your price protection threshold might also fluctuate.

Specify the price protection threshold

To specify the price protection threshold

While creating the EC2 Fleet, configure the fleet for attribute-based instance type selection, and then do the following:

- To specify the On-Demand Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, for `OnDemandMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.
- To specify the Spot Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, specify *one* of the following parameters:
 - For `MaxSpotPriceAsPercentageOfOptimalOnDemandPrice`, enter the price protection threshold as a percentage.
 - For `SpotMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.

For more information about creating the fleet, see [Create an EC2 Fleet with attribute-based instance type selection](#).

Note

When creating the EC2 Fleet, if you set TargetCapacityUnitType to vcpu or memory-mib, the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

Considerations

- You can specify either instance types or instance attributes in an EC2 Fleet, but not both at the same time.

When using the CLI, the launch template overrides will override the launch template. For example, if the launch template contains an instance type and the launch template override contains instance attributes, the instances that are identified by the instance attributes will override the instance type in the launch template.

- When using the CLI, when you specify instance attributes as overrides, you can't also specify weights or priorities.
- You can specify a maximum of four InstanceRequirements structures in a request configuration.

Create an EC2 Fleet with attribute-based instance type selection

You can configure a fleet to use attribute-based instance type selection by using the AWS CLI.

To create an EC2 Fleet with attribute-based instance type selection (AWS CLI)

Use the [create-fleet](#) (AWS CLI) command to create an EC2 Fleet. Specify the fleet configuration in a JSON file.

```
aws ec2 create-fleet \
  --region us-east-1 \
  --cli-input-json file://file_name.json
```

Example *file_name*.json file

The following example contains the parameters that configure an EC2 Fleet to use attribute-based instance type selection, and is followed by a text explanation.

```
{  
    "SpotOptions": {  
        "AllocationStrategy": "price-capacity-optimized"  
    },  
    "LaunchTemplateConfigs": [{  
        "LaunchTemplateSpecification": {  
            "LaunchTemplateName": "my-launch-template",  
            "Version": "1"  
        },  
        "Overrides": [{  
            "InstanceRequirements": {  
                "VCpuCount": {  
                    "Min": 2  
                },  
                "MemoryMiB": {  
                    "Min": 4  
                }  
            }  
        }]  
    }],  
    "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 20,  
        "DefaultTargetCapacityType": "spot"  
    },  
    "Type": "instant"  
}
```

The attributes for attribute-based instance type selection are specified in the `InstanceRequirements` structure. In this example, two attributes are specified:

- `VCpuCount` – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- `MemoryMiB` – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when [EC2 Fleet provisions the fleet](#).

For a list and descriptions of all the possible attributes that you can specify, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

Note

When `InstanceRequirements` is included in the fleet configuration, `InstanceType` and `WeightedCapacity` must be excluded; they cannot determine the fleet configuration at the same time as instance attributes.

The JSON also contains the following fleet configuration:

- "AllocationStrategy": "*price-capacity-optimized*" – The allocation strategy for the Spot Instances in the fleet.
- "LaunchTemplateName": "*my-launch-template*", "Version": "*1*" – The launch template contains some instance configuration information, but if any instance types are specified, they will be overridden by the attributes that are specified in `InstanceRequirements`.
- "TotalTargetCapacity": *20* – The target capacity is 20 instances.
- "DefaultTargetCapacityType": "*spot*" – The default capacity is Spot Instances.
- "Type": "*instant*" – The request type for the fleet is instant.

Examples of configurations that are valid and not valid

If you use the AWS CLI to create an EC2 Fleet, you must make sure that your fleet configuration is valid. The following examples show configurations that are valid and not valid.

Configurations are considered not valid when they contain the following:

- A single `Overrides` structure with both `InstanceRequirements` and `InstanceType`
- Two `Overrides` structures, one with `InstanceRequirements` and the other with `InstanceType`
- Two `InstanceRequirements` structures with overlapping attribute values within the same `LaunchTemplateSpecification`

Example configurations

- [Valid configuration: Single launch template with overrides](#)
- [Valid configuration: Single launch template with multiple InstanceRequirements](#)
- [Valid configuration: Two launch templates, each with overrides](#)

- [Valid configuration: Only InstanceRequirements specified, no overlapping attribute values](#)
- [Configuration not valid: Overrides contain InstanceRequirements and InstanceType](#)
- [Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType](#)
- [Configuration not valid: Overlapping attribute values](#)

Valid configuration: Single launch template with overrides

The following configuration is valid. It contains one launch template and one Overrides structure containing one InstanceRequirements structure. A text explanation of the example configuration follows.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "My-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceRequirements": {  
                        "VCpuCount": {  
                            "Min": 2,  
                            "Max": 8  
                        },  
                        "MemoryMib": {  
                            "Min": 0,  
                            "Max": 10240  
                        },  
                        "MemoryGiBPerVCpu": {  
                            "Max": 10000  
                        },  
                        "RequireHibernateSupport": true  
                    }  
                }  
            ]  
        }  
    ],  
    "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 5000,  
        "DefaultTargetCapacityType": "spot",  
    }  
}
```

```
        "TargetCapacityUnitType": "vcpu"
    }
}
}
```

InstanceRequirements

To use attribute-based instance selection, you must include the `InstanceRequirements` structure in your fleet configuration, and specify the desired attributes for the instances in the fleet.

In the preceding example, the following instance attributes are specified:

- `VCpuCount` – The instance types must have a minimum of 2 and a maximum of 8 vCPUs.
- `MemoryMiB` – The instance types must have a maximum of 10240 MiB of memory. A minimum of 0 indicates no minimum limit.
- `MemoryGiBPerVCpu` – The instance types must have a maximum of 10,000 GiB of memory per vCPU. The `Min` parameter is optional. By omitting it, you indicate no minimum limit.

TargetCapacityUnitType

The `TargetCapacityUnitType` parameter specifies the unit for the target capacity. In the example, the target capacity is 5000 and the target capacity unit type is `vcpu`, which together specify a desired target capacity of 5,000 vCPUs. EC2 Fleet will launch enough instances so that the total number of vCPUs in the fleet is 5,000 vCPUs.

Valid configuration: Single launch template with multiple InstanceRequirements

The following configuration is valid. It contains one launch template and one `Overrides` structure containing two `InstanceRequirements` structures. The attributes specified in `InstanceRequirements` are valid because the values do not overlap—the first `InstanceRequirements` structure specifies a `VCpuCount` of 0-2 vCPUs, while the second `InstanceRequirements` structure specifies 4-8 vCPUs.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyLaunchTemplate",
                "Version": "1"
```

```
        },
        "Overrides": [
            {
                "InstanceRequirements": {
                    "VCpuCount": {
                        "Min": 0,
                        "Max": 2
                    },
                    "MemoryMiB": {
                        "Min": 0
                    }
                }
            },
            {
                "InstanceRequirements": {
                    "VCpuCount": {
                        "Min": 4,
                        "Max": 8
                    },
                    "MemoryMiB": {
                        "Min": 0
                    }
                }
            }
        ]
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 1,
        "DefaultTargetCapacityType": "spot"
    }
}
}
```

Valid configuration: Two launch templates, each with overrides

The following configuration is valid. It contains two launch templates, each with one Overrides structure containing one InstanceRequirements structure. This configuration is useful for arm and x86 architecture support in the same fleet.

```
{
    "LaunchTemplateConfigs": [
        {

```

```
        "LaunchTemplateSpecification": {
            "LaunchTemplateName": "armLaunchTemplate",
            "Version": "1"
        },
        "Overrides": [
            {
                "InstanceRequirements": {
                    "VCpuCount": {
                        "Min": 0,
                        "Max": 2
                    },
                    "MemoryMiB": {
                        "Min": 0
                    }
                }
            },
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "x86LaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 0,
                                "Max": 2
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    }
                ]
            }
        ],
        "TargetCapacitySpecification": {
            "TotalTargetCapacity": 1,
            "DefaultTargetCapacityType": "spot"
        }
    }
}
```

Valid configuration: Only InstanceRequirements specified, no overlapping attribute values

The following configuration is valid. It contains two LaunchTemplateSpecification structures, each with a launch template and an Overrides structure containing an InstanceRequirements structure. The attributes specified in InstanceRequirements are valid because the values do not overlap—the first InstanceRequirements structure specifies a VCpuCount of 0-2 vCPUs, while the second InstanceRequirements structure specifies 4-8 vCPUs.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "MyLaunchTemplate",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceRequirements": {  
                        "VCpuCount": {  
                            "Min": 0,  
                            "Max": 2  
                        },  
                        "MemoryMiB": {  
                            "Min": 0  
                        }  
                    }  
                }  
            ]  
        },  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "MyOtherLaunchTemplate",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceRequirements": {  
                        "VCpuCount": {  
                            "Min": 4,  
                            "Max": 8  
                        },  
                        "MemoryMiB": {  
                            "Min": 0  
                        }  
                    }  
                }  
            ]  
        }  
    ]  
}
```

```
        }
    }
}
],
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 1,
    "DefaultTargetCapacityType": "spot"
}
}
}
```

Configuration not valid: Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structure contains both InstanceRequirements and InstanceType. For the Overrides, you can specify either InstanceRequirements or InstanceType, but not both.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                },
                {
                    "InstanceType": "m5.large"
                }
            ]
        }
    ]
}
```

```
        ],
        "TargetCapacitySpecification": {
            "TotalTargetCapacity": 1,
            "DefaultTargetCapacityType": "spot"
        }
    }
}
```

Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structures contain both InstanceRequirements and InstanceType. You can specify either InstanceRequirements or InstanceType, but not both, even if they're in different Overrides structures.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
            ]
        },
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyOtherLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "m5.large"
                }
            ]
        }
    ]
}
```

```
        }
    ],
},
],
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 1,
    "DefaultTargetCapacityType": "spot"
}
}
}
```

Configuration not valid: Overlapping attribute values

The following configuration is not valid. The two `InstanceRequirements` structures each contain `"VCpuCount": {"Min": 0, "Max": 2}`. The values for these attributes overlap, which will result in duplicate capacity pools.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    },
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 0,
                                "Max": 2
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    }
                ]
            }
        }
    ]
}
```

```
        }
    }
}
],
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 1,
    "DefaultTargetCapacityType": "spot"
}
}
}
```

Preview instance types with specified attributes

You can use the [get-instance-types-from-instance-requirements](#) AWS CLI command to preview the instance types that match the attributes that you specify. This is especially useful for working out what attributes to specify in your request configuration without launching any instances. Note that the command does not consider available capacity.

To preview a list of instance types by specifying attributes using the AWS CLI

1. (Optional) To generate all of the possible attributes that can be specified, use the [get-instance-types-from-instance-requirements](#) command and the `--generate-cli-skeleton` parameter. You can optionally direct the output to a file to save it by using `input > attributes.json`.

```
aws ec2 get-instance-types-from-instance-requirements \
--region us-east-1 \
--generate-cli-skeleton input > attributes.json
```

Expected output

```
{
    "DryRun": true,
    "ArchitectureTypes": [
        "i386"
    ],
    "VirtualizationTypes": [
        "hvm"
    ]
}
```

```
],
"InstanceRequirements": {
    "VCpuCount": {
        "Min": 0,
        "Max": 0
    },
    "MemoryMiB": {
        "Min": 0,
        "Max": 0
    },
    "CpuManufacturers": [
        "intel"
    ],
    "MemoryGiBPerVCpu": {
        "Min": 0.0,
        "Max": 0.0
    },
    "ExcludedInstanceTypes": [
        ""
    ],
    "InstanceGenerations": [
        "current"
    ],
    "SpotMaxPricePercentageOverLowestPrice": 0,
    "OnDemandMaxPricePercentageOverLowestPrice": 0,
    "BareMetal": "included",
    "BurstablePerformance": "included",
    "RequireHibernateSupport": true,
    "NetworkInterfaceCount": {
        "Min": 0,
        "Max": 0
    },
    "LocalStorage": "included",
    "LocalStorageTypes": [
        "hdd"
    ],
    "TotalLocalStorageGB": {
        "Min": 0.0,
        "Max": 0.0
    },
    "BaselineEbsBandwidthMbps": {
        "Min": 0,
        "Max": 0
    }
},
```

```
    "AcceleratorTypes": [
        "gpu"
    ],
    "AcceleratorCount": {
        "Min": 0,
        "Max": 0
    },
    "AcceleratorManufacturers": [
        "nvidia"
    ],
    "AcceleratorNames": [
        "a100"
    ],
    "AcceleratorTotalMemoryMiB": {
        "Min": 0,
        "Max": 0
    },
    "NetworkBandwidthGbps": {

        "Max": 0.0
    },
    "AllowedInstanceTypes": [
        ""
    ],
    "MaxResults": 0,
    "NextToken": ""
}
```

2. Create a JSON configuration file using the output from the previous step, and configure it as follows:

 **Note**

You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. You can omit the other attributes; when omitted, the default values are used.

For a description of each attribute and their default values, see [get-instance-types-from-instance-requirements](#) in the *Amazon EC2 Command Line Reference*.

- a. For `ArchitectureTypes`, specify one or more types of processor architecture.

- b. For `VirtualizationTypes`, specify one or more types of virtualization.
 - c. For `VCpuCount`, specify the minimum and maximum number of vCPUs. To specify no minimum limit, for `Min`, specify `0`. To specify no maximum limit, omit the `Max` parameter.
 - d. For `MemoryMiB`, specify the minimum and maximum amount of memory in MiB. To specify no minimum limit, for `Min`, specify `0`. To specify no maximum limit, omit the `Max` parameter.
 - e. You can optionally specify one or more of the other attributes to further constrain the list of instance types that are returned.
3. To preview the instance types that have the attributes that you specified in the JSON file, use the [get-instance-types-from-instance-requirements](#) command, and specify the name and path to your JSON file by using the `--cli-input-json` parameter. You can optionally format the output to appear in a table format.

```
aws ec2 get-instance-types-from-instance-requirements \
    --cli-input-json file://attributes.json \
    --output table
```

Example *attributes.json* file

In this example, the required attributes are included in the JSON file. They are `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. In addition, the optional `InstanceGenerations` attribute is also included. Note that for `MemoryMiB`, the `Max` value can be omitted to indicate that there is no limit.

```
{  
  
    "ArchitectureTypes": [  
        "x86_64"  
    ],  
    "VirtualizationTypes": [  
        "hvm"  
    ],  
    "InstanceRequirements": {  
        "VCpuCount": {  
            "Min": 4,  
            "Max": 6  
        },  
        "MemoryMiB": {  
            "Min": 2048
```

```
    },
    "InstanceGenerations": [
        "current"
    ]
}
```

Example output

```
-----|GetInstanceTypesFromInstanceRequirements|
+-----+
||      InstanceTypes      ||
|+-----+|
||      InstanceType       ||
|+-----+|
||  c4.xlarge              ||
||  c5.xlarge               ||
||  c5a.xlarge              ||
||  c5ad.xlarge             ||
||  c5d.xlarge              ||
||  c5n.xlarge              ||
||  d2.xlarge               ||
...
...
```

4. After identifying instance types that meet your needs, make note of the instance attributes that you used so that you can use them when configuring your fleet request.

Configure EC2 Fleet for On-Demand backup

If you have urgent, unpredictable scaling needs, such as a news website that must scale during a major news event or game launch, we recommend that you specify alternative instance types for your On-Demand Instances, in the event that your preferred option does not have sufficient available capacity. For example, you might prefer c5.2xlarge On-Demand Instances, but if there is insufficient available capacity, you'd be willing to use some c4.2xlarge instances during peak load. In this case, EC2 Fleet attempts to fulfill all of your target capacity using c5.2xlarge instances, but if there is insufficient capacity, it automatically launches c4.2xlarge instances to fulfill the target capacity.

Topics

- [Prioritize instance types for On-Demand capacity](#)
- [Use Capacity Reservations for On-Demand Instances](#)

Prioritize instance types for On-Demand capacity

When EC2 Fleet attempts to fulfill your On-Demand capacity, it defaults to launching the lowest priced instance type first. If AllocationStrategy is set to prioritized, EC2 Fleet uses priority to determine which instance type to use first in fulfilling On-Demand capacity. The priority is assigned to the launch template override, and the highest priority is launched first.

Example: Prioritize instance types

In this example, you configure three launch template overrides, each with a different instance type.

The On-Demand price for the instance types range in price. The following are the instance types used in this example, listed in order of price, starting with the least expensive instance type:

- m4.large – least expensive
- m5.large
- m5a.large

If you do not use priority to determine the order, the fleet fulfills the On-Demand capacity by starting with the least expensive instance type.

However, say you have unused m5.large Reserved Instances that you want to use first. You can set the launch template override priority so that the instance types are used in the order of priority, as follows:

- m5.large – priority 1
- m4.large – priority 2
- m5a.large – priority 3

Use Capacity Reservations for On-Demand Instances

With On-Demand Capacity Reservations, you can reserve compute capacity for your On-Demand Instances in a specified Availability Zone for any duration. You can configure an EC2 Fleet to use the Capacity Reservations first when launching On-Demand Instances.

Capacity Reservations are configured as either open or targeted. EC2 Fleet can launch On-Demand Instances into either open or targeted Capacity Reservations, as follows:

- If a Capacity Reservation is open, On-Demand Instances that have matching attributes automatically run in the reserved capacity.
- If a Capacity Reservation is targeted, On-Demand Instances must specifically target it to run in the reserved capacity. This is useful for using up specific Capacity Reservations or for controlling when to use specific Capacity Reservations.

If you use targeted Capacity Reservations in your EC2 Fleet, there must be enough Capacity Reservations to fulfil the target On-Demand capacity, otherwise the launch fails. To avoid a launch fail, rather add the targeted Capacity Reservations to a resource group, and then target the resource group. The resource group doesn't need to have enough Capacity Reservations; if it runs out of Capacity Reservations before the target On-Demand capacity is fulfilled, the fleet can launch the remaining target capacity into regular On-Demand capacity.

To use Capacity Reservations with EC2 Fleet

1. Configure the fleet as type instant. You can't use Capacity Reservations for fleets of other types.
2. Configure the usage strategy for Capacity Reservations as use-capacity-reservations-first.
3. In the launch template, for **Capacity reservation**, choose either **Open** or **Target by group**. If you choose **Target by group**, specify the Capacity Reservations resource group ID.

When the fleet attempts to fulfil the On-Demand capacity, if it finds that multiple instance pools have unused matching Capacity Reservations, it determines the pools in which to launch the On-Demand Instances based on the On-Demand allocation strategy (lowest-price or prioritized).

For examples of how to configure a fleet to use Capacity Reservations to fulfil On-Demand capacity, see [EC2 Fleet example configurations](#), specifically Examples 5 through 7.

For information about configuring Capacity Reservations, see [On-Demand Capacity Reservations](#) and the [On-Demand Capacity Reservation FAQs](#).

Capacity Rebalancing

You can configure EC2 Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation to notify you that a Spot Instance is at an elevated risk of interruption. Capacity Rebalancing helps you maintain workload availability by proactively augmenting your fleet with a new Spot Instance before a running instance is interrupted by Amazon EC2. For more information, see [EC2 instance rebalance recommendations](#).

To configure EC2 Fleet to launch a replacement Spot Instance, use the [create-fleet](#) (AWS CLI) command and the relevant parameters in the MaintenanceStrategies structure. For more information, see the [example launch configuration](#).

Limitations

- Capacity Rebalancing is available only for fleets of type `maintain`.
- When the fleet is running, you can't modify the Capacity Rebalancing setting. To change the Capacity Rebalancing setting, you must delete the fleet and create a new fleet.

Configuration options

The ReplacementStrategy for EC2 Fleet supports the following two values:

launch-before-terminate

Amazon EC2 terminates the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched. When you specify `launch-before-terminate`, you must also specify a value for `termination-delay`. After the new replacement instances are launched, Amazon EC2 waits for the duration of the `termination-delay`, and then terminates the old instances. For `termination-delay`, the minimum is 120 seconds (2 minutes), and the maximum is 7200 seconds (2 hours).

We recommend that you use `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed. Note that Amazon EC2 can interrupt the old instances with a two-minute warning before the `termination-delay`.

We strongly recommend against using the `lowest-price` allocation strategy in combination with `launch-before-terminate` to avoid having replacement Spot Instances that are also at an elevated risk of interruption.

Launch

Amazon EC2 launches replacement Spot Instances when a rebalance notification is emitted for existing Spot Instances. Amazon EC2 does not terminate the instances that receive a rebalance notification. You can terminate the old instances, or you can leave them running. You are charged for all instances while they are running.

Considerations

If you configure an EC2 Fleet for Capacity Rebalancing, consider the following:

Provide as many Spot capacity pools in the request as possible

Configure your EC2 Fleet to use multiple instance types and Availability Zones. This provides the flexibility to launch Spot Instances in various Spot capacity pools. For more information, see [Be flexible about instance types and Availability Zones](#).

Avoid an elevated risk of interruption of replacement Spot Instances

Your replacement Spot Instances may be at an elevated risk of interruption if you use the lowest-price allocation strategy. This is because Amazon EC2 will always launch instances in the lowest priced pool that has available capacity at that moment, even if your replacement Spot Instances are likely to be interrupted soon after being launched. To avoid an elevated risk of interruption, we strongly recommend against using the lowest-price allocation strategy, and instead recommend the capacity-optimized or capacity-optimized-prioritized allocation strategy. These strategies ensure that replacement Spot Instances are launched in the most optimal Spot capacity pools, and are therefore less likely to be interrupted in the near future. For more information, see [Use the price and capacity optimized allocation strategy](#).

Amazon EC2 will only launch a new instance if availability is the same or better

One of the goals of Capacity Rebalancing is to improve a Spot Instance's availability. If an existing Spot Instance receives a rebalance recommendation, Amazon EC2 will only launch a new instance if the new instance provides the same or better availability than the existing instance. If the risk of interruption of a new instance will be worse than the existing instance, then Amazon EC2 will not launch a new instance. Amazon EC2 will, however, continue to assess the Spot capacity pools, and will launch a new instance if availability improves.

There is a chance that your existing instance will be interrupted without Amazon EC2 proactively launching a new instance. When this happens, Amazon EC2 will attempt to launch a new instance regardless of whether the new instance has a high risk of interruption.

Capacity Rebalancing does not increase your Spot Instance interruption rate

When you enable Capacity Rebalancing, it does not increase your [Spot Instance interruption rate](#) (the number of Spot Instances that are reclaimed when Amazon EC2 needs the capacity back). However, if Capacity Rebalancing detects an instance is at risk of interruption, Amazon EC2 will immediately attempt to launch a new instance. The result is that more instances might be replaced than if you'd waited for Amazon EC2 to launch a new instance after the at-risk instance was interrupted.

While you might replace more instances with Capacity Rebalancing enabled, you benefit from being proactive rather than reactive by having more time to take action before your instances are interrupted. With a [Spot Instance interruption notice](#), you typically only have up to two minutes to gracefully shut down your instance. With Capacity Rebalancing launching a new instance in advance, you give existing processes a better chance of completing on your at-risk instance, you can start your instance shutdown procedures, and prevent new work from being scheduled on your at-risk instance. You can also start preparing the newly-launched instance to take over the application. With Capacity Rebalancing's proactive replacement, you benefit from graceful continuity.

As a theoretical example to demonstrate the risks and benefits of using Capacity Rebalancing, consider the following scenario:

- 2:00 PM – A rebalance recommendation is received for instance-A, and Amazon EC2 immediately starts attempting to launch a replacement instance-B, giving you time to start your shutdown procedures.*
- 2:30 PM – A rebalance recommendation is received for instance-B, replaced with instance-C, giving you time to start your shutdown procedures.*
- 2:32 PM – If Capacity Rebalancing wasn't enabled, and if a Spot Instance interruption notice would've been received at 2:32 PM for instance-A, you would only have had up to two minutes to take action, but Instance-A would have been running up till this time.

* If `launch-before-terminate` is specified, Amazon EC2 will terminate the at-risk instance after the replacement instance comes online.

Amazon EC2 can launch new replacement Spot Instances until fulfilled capacity is double target capacity

When an EC2 Fleet is configured for Capacity Rebalancing, the fleet attempts to launch a new replacement Spot Instance for every Spot Instance that receives a rebalance recommendation. After a Spot Instance receives a rebalance recommendation, it is no longer counted as part of

the fulfilled capacity. Depending on the replacement strategy, Amazon EC2 either terminates the instance after a preconfigured termination delay, or leaves it running. This gives you the opportunity to perform [rebalancing actions](#) on the instance.

If your fleet reaches double its target capacity, it stops launching new replacement instances even if the replacement instances themselves receive a rebalance recommendation.

For example, you create an EC2 Fleet with a target capacity of 100 Spot Instances. All of the Spot Instances receive a rebalance recommendation, which causes Amazon EC2 to launch 100 replacement Spot Instances. This raises the number of fulfilled Spot Instances to 200, which is double the target capacity. Some of the replacement instances receive a rebalance recommendation, but no more replacement instances are launched because the fleet cannot exceed double its target capacity.

Note that you are charged for all of the instances while they are running.

We recommend that you configure EC2 Fleet to terminate Spot Instances that receive a rebalance recommendation

If you configure your EC2 Fleet for Capacity Rebalancing, we recommend that you choose `launch-before-terminate` with an appropriate termination delay only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed.

If you choose to terminate the instances that are recommended for rebalance yourself, we recommend that you monitor the rebalance recommendation signal that is received by the Spot Instances in the fleet. By monitoring the signal, you can quickly perform [rebalancing actions](#) on the affected instances before Amazon EC2 interrupts them, and then you can manually terminate them. If you do not terminate the instances, you continue paying for them while they are running. Amazon EC2 does not automatically terminate the instances that receive a rebalance recommendation.

You can set up notifications using Amazon EventBridge or instance metadata. For more information, see [Monitor rebalance recommendation signals](#).

EC2 Fleet does not count instances that receive a rebalance recommendation when calculating fulfilled capacity during scale in or out

If your EC2 Fleet is configured for Capacity Rebalancing, and you change the target capacity to either scale in or scale out, the fleet does not count the instances that are marked for rebalance as part of the fulfilled capacity, as follows:

- Scale in – If you decrease your desired target capacity, Amazon EC2 terminates instances that are not marked for rebalance until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create an EC2 Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so Amazon EC2 launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then reduce the target capacity to 50 (scale in), but the fulfilled capacity is actually 60 instances because the 10 instances that are marked for rebalance are not terminated by Amazon EC2. You need to manually terminate these instances, or you can leave them running.

- Scale out – If you increase your desired target capacity, Amazon EC2 launches new instances until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create an EC2 Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so the fleet launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then increase the target capacity to 200 (scale out), but the fulfilled capacity is actually 210 instances because the 10 instances that are marked for rebalance are not counted by the fleet as part of the target capacity. You need to manually terminate these instances, or you can leave them running.

Maximum price overrides

Each EC2 Fleet can either include a global maximum price, or use the default (the On-Demand price). The fleet uses this as the default maximum price for each of its launch specifications.

You can optionally specify a maximum price in one or more launch specifications. This price is specific to the launch specification. If a launch specification includes a specific price, the EC2 Fleet uses this maximum price, overriding the global maximum price. Any other launch specifications that do not include a specific maximum price still use the global maximum price.

Control spending

EC2 Fleet stops launching instances when it has met one of the following parameters: the `TotalTargetCapacity` or the `MaxTotalPrice` (the maximum amount you're willing to pay). To control the amount you pay per hour for your fleet, you can specify the `MaxTotalPrice`. When the maximum total price is reached, EC2 Fleet stops launching instances even if it hasn't met the target capacity.

The following examples show two different scenarios. In the first, EC2 Fleet stops launching instances when it has met the target capacity. In the second, EC2 Fleet stops launching instances when it has reached the maximum amount you're willing to pay (MaxTotalPrice).

Example: Stop launching instances when target capacity is reached

Given a request for m4.large On-Demand Instances, where:

- On-Demand Price: \$0.10 per hour
- OnDemandTargetCapacity: 10
- MaxTotalPrice: \$1.50

EC2 Fleet launches 10 On-Demand Instances because the total of \$1.00 (10 instances x \$0.10) does not exceed the MaxTotalPrice of \$1.50 for On-Demand Instances.

Example: Stop launching instances when maximum total price is reached

Given a request for m4.large On-Demand Instances, where:

- On-Demand Price: \$0.10 per hour
- OnDemandTargetCapacity: 10
- MaxTotalPrice: \$0.80

If EC2 Fleet launches the On-Demand target capacity (10 On-Demand Instances), the total cost per hour would be \$1.00. This is more than the amount (\$0.80) specified for MaxTotalPrice for On-Demand Instances. To prevent spending more than you're willing to pay, EC2 Fleet launches only 8 On-Demand Instances (below the On-Demand target capacity) because launching more would exceed the MaxTotalPrice for On-Demand Instances.

EC2 Fleet instance weighting

When you create an EC2 Fleet, you can define the capacity units that each instance type would contribute to your application's performance. You can then adjust your maximum price for each launch specification by using *instance weighting*.

By default, the price that you specify is *per instance hour*. When you use the instance weighting feature, the price that you specify is *per unit hour*. You can calculate your price per unit hour by dividing your price for an instance type by the number of units that it represents. EC2 Fleet

calculates the number of instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity. The fleet can select any pool that you specify in your launch specification, even if the capacity of the instances launched exceeds the requested target capacity.

The following table includes examples of calculations to determine the price per unit for an EC2 Fleet with a target capacity of 10.

Instance type	Instance weight	Target capacity	Number of instances launched	Price per instance hour	Price per unit hour
r3.xlarge	2	10	5	\$0.05	\$0.025 (.05 divided by 2)
r3.8xlarge	8	10	2 (10 divided by 8, result rounded up)	\$0.10	\$0.0125 (.10 divided by 8)

Use EC2 Fleet instance weighting as follows to provision the target capacity that you want in the pools with the lowest price per unit at the time of fulfillment:

1. Set the target capacity for your EC2 Fleet either in instances (the default) or in the units of your choice, such as virtual CPUs, memory, storage, or throughput.
2. Set the price per unit.
3. For each launch specification, specify the weight, which is the number of units that the instance type represents toward the target capacity.

Instance weighting example

Consider an EC2 Fleet request with the following configuration:

- A target capacity of 24
- A launch specification with an instance type `r3.2xlarge` and a weight of 6
- A launch specification with an instance type `c3.xlarge` and a weight of 5

The weights represent the number of units that instance type represents toward the target capacity. If the first launch specification provides the lowest price per unit (price for `r3.2xlarge` per instance hour divided by 6), the EC2 Fleet would launch four of these instances (24 divided by 6).

If the second launch specification provides the lowest price per unit (price for `c3.xlarge` per instance hour divided by 5), the EC2 Fleet would launch five of these instances (24 divided by 5, result rounded up).

Instance weighting and allocation strategy

Consider an EC2 Fleet request with the following configuration:

- A target capacity of 30 Spot Instances
- A launch specification with an instance type `c3.2xlarge` and a weight of 8
- A launch specification with an instance type `m3.xlarge` and a weight of 8
- A launch specification with an instance type `r3.xlarge` and a weight of 8

The EC2 Fleet would launch four instances (30 divided by 8, result rounded up). With the lowest-price strategy, all four instances come from the pool that provides the lowest price per unit. With the diversified strategy, the fleet launches one instance in each of the three pools, and the fourth instance in whichever of the three pools provides the lowest price per unit.

Work with EC2 Fleets

To start using an EC2 Fleet, you create a request that includes the total target capacity, On-Demand capacity, Spot capacity, one or more launch specifications for the instances, and the maximum price that you are willing to pay. The fleet request must include a launch template that defines the information that the fleet needs to launch an instance, such as an AMI, instance type, subnet or Availability Zone, and one or more security groups. You can specify launch specification overrides for the instance type, subnet, Availability Zone, and maximum price you're willing to pay, and you can assign weighted capacity to each launch specification override.

The EC2 Fleet launches On-Demand Instances when there is available capacity, and launches Spot Instances when your maximum price exceeds the Spot price and capacity is available.

If your fleet includes Spot Instances, Amazon EC2 can attempt to maintain your fleet target capacity as Spot prices change.

An EC2 Fleet request of type `maintain` or `request` remains active until it expires or you delete it. When you delete a fleet of type `maintain` or `request`, you can specify whether deletion terminates the instances in that fleet. Otherwise, the On-Demand Instances run until you terminate them, and the Spot Instances run until they are interrupted or you terminate them.

Contents

EC2 Fleet request states

An EC2 Fleet request can be in one of the following states:

submitted

The EC2 Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances. The request can include On-Demand Instances, Spot Instances, or both. If a request would exceed your fleet limits, it is deleted immediately.

active

The EC2 Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances. The request remains in this state until it is modified or deleted.

modifying

The EC2 Fleet request is being modified. The request remains in this state until the modification is fully processed or the request is deleted. Only a maintain fleet type can be modified. This state does not apply to other request types.

deleted_running

The EC2 Fleet request is deleted and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated manually. The request remains in this state until all instances are interrupted or terminated. Only an EC2 Fleet of type maintain or request can have running instances after the EC2 Fleet request is deleted. A deleted instant fleet with running instances is not supported. This state does not apply to instant fleets.

deleted_terminating

The EC2 Fleet request is deleted and its instances are terminating. The request remains in this state until all instances are terminated.

deleted

The EC2 Fleet is deleted and has no running instances. The request is deleted two days after its instances are terminated.

EC2 Fleet prerequisites

To create an EC2 Fleet, the following prerequisites must be in place:

- [Launch template](#)
- [Service-linked role for EC2 Fleet](#)
- [Grant access to customer managed keys for use with encrypted AMIs and EBS snapshots](#)
- [Permissions for EC2 Fleet users](#)

Launch template

A launch template includes information about the instances to launch, such as the instance type, Availability Zone, and the maximum price that you are willing to pay. For more information, see [Launch an instance from a launch template](#).

Service-linked role for EC2 Fleet

The `AWSServiceRoleForEC2Fleet` role grants the EC2 Fleet permission to request, launch, terminate, and tag instances on your behalf. Amazon EC2 uses this service-linked role to complete the following actions:

- `ec2:RunInstances` – Launch instances.
- `ec2:RequestSpotInstances` – Request Spot Instances.
- `ec2:TerminateInstances` – Terminate instances.
- `ec2:DescribeImages` – Describe Amazon Machine Images (AMIs) for the Spot Instances.
- `ec2:DescribeInstanceStatus` – Describe the status of the Spot Instances.
- `ec2:DescribeSubnets` – Describe the subnets for Spot Instances.
- `ec2:CreateTags` – Add tags to the EC2 Fleet, instances, and volumes.

Ensure that this role exists before you use the AWS CLI or an API to create an EC2 Fleet.

Note

An instant EC2 Fleet does not require this role.

To create the role, use the IAM console as follows.

To create the `AWSServiceRoleForEC2Fleet` role for EC2 Fleet

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**, and then choose **Create role**.
3. On the **Select type of trusted entity** page, do the following:
 - a. For **Trusted entity type**, choose **AWS service**.
 - b. Under **Use case**, for **Service or use case**, choose **EC2 - Fleet**.

Tip

Be sure to choose **EC2 - Fleet**. If you choose **EC2**, the **EC2 - Fleet** use case does not appear in the **Use case** list. The **EC2 - Fleet** use case will

automatically create a policy with the required IAM permissions and will suggest **AWSServiceRoleForEC2Fleet** as the role name.

- c. Choose **Next**.
4. On the **Add permissions page**, choose **Next**.
5. On the **Name, review, and create page**, choose **Create role**.

If you no longer need to use EC2 Fleet, we recommend that you delete the **AWSServiceRoleForEC2Fleet** role. After this role is deleted from your account, you can create the role again if you create another fleet.

For more information, see [Using service-linked roles](#) in the *IAM User Guide*.

Grant access to customer managed keys for use with encrypted AMIs and EBS snapshots

If you specify an [encrypted AMI](#) or an encrypted Amazon EBS snapshot in your EC2 Fleet and you use an AWS KMS key for encryption, you must grant the **AWSServiceRoleForEC2Fleet** role permission to use the customer managed key so that Amazon EC2 can launch instances on your behalf. To do this, you must add a grant to the customer managed key, as shown in the following procedure.

When providing permissions, grants are an alternative to key policies. For more information, see [Using grants](#) and [Using key policies in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

To grant the **AWSServiceRoleForEC2Fleet** role permissions to use the customer managed key

- Use the [create-grant](#) command to add a grant to the customer managed key and to specify the principal (the **AWSServiceRoleForEC2Fleet** service-linked role) that is given permission to perform the operations that the grant permits. The customer managed key is specified by the `key-id` parameter and the ARN of the customer managed key. The principal is specified by the `grantee-principal` parameter and the ARN of the **AWSServiceRoleForEC2Fleet** service-linked role.

```
aws kms create-grant \
  --region us-east-1 \
  --key-id arn:aws:kms:us-
east-1:444455556666:key/1234abcd-12ab-34cd-56ef-1234567890ab \
  --grantee-principal arn:aws:iam::111122223333:role/AWSServiceRoleForEC2Fleet \
```

```
--operations "Decrypt" "Encrypt" "GenerateDataKey"  
"GenerateDataKeyWithoutPlaintext" "CreateGrant" "DescribeKey" "ReEncryptFrom"  
"ReEncryptTo"
```

Permissions for EC2 Fleet users

If your users will create or manage an EC2 Fleet, be sure to grant them the required permissions.

To create a policy for EC2 Fleet

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Policies**.
3. Choose **Create policy**.
4. On the **Create policy** page, choose the **JSON** tab, replace the text with the following, and choose **Review policy**.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:*"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "iam>ListRoles",  
                "iam:PassRole",  
                "iam>ListInstanceProfiles"  
            ],  
            "Resource": "arn:aws:iam::123456789012:role/DevTeam*"  
        }  
    ]  
}
```

The `ec2:*` grants a user permission to call all Amazon EC2 API actions. To limit the user to specific Amazon EC2 API actions, specify those actions instead.

The user must have permission to call the `iam>ListRoles` action to enumerate existing IAM roles, the `iam:PassRole` action to specify the EC2 Fleet role, and the `iam>ListInstanceProfiles` action to enumerate existing instance profiles.

(Optional) To enable a user to create roles or instance profiles using the IAM console, you must also add the following actions to the policy:

- `iam:AddRoleToInstanceProfile`
- `iam:AttachRolePolicy`
- `iam>CreateInstanceProfile`
- `iam:CreateRole`
- `iam:GetRole`
- `iam>ListPolicies`

5. On the **Review policy** page, enter a policy name and description, and choose **Create policy**.
6. To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center User Guide*.

- Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.

- IAM users:

- Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.

- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

EC2 Fleet health checks

EC2 Fleet checks the health status of the instances in the fleet every two minutes. The health status of an instance is either healthy or unhealthy.

EC2 Fleet determines the health status of an instance by using the status checks provided by Amazon EC2. An instance is determined as unhealthy when the status of either the instance status check or the system status check is impaired for three consecutive health status checks. For more information, see [Status checks for your instances](#).

You can configure your fleet to replace unhealthy Spot Instances. After setting ReplaceUnhealthyInstances to true, a Spot Instance is replaced when it is reported as unhealthy. The fleet can go below its target capacity for up to a few minutes while an unhealthy Spot Instance is being replaced.

Requirements

- Health check replacement is supported only for EC2 Fleets that maintain a target capacity (fleets of type maintain), and not for fleets of type request or instant.
- Health check replacement is supported only for Spot Instances. This feature is not supported for On-Demand Instances.
- You can configure your EC2 Fleet to replace unhealthy instances only when you create it.
- Users can use health check replacement only if they have permission to call the ec2:DescribeInstanceStatus action.

To configure an EC2 Fleet to replace unhealthy Spot Instances

1. Follow the steps for creating an EC2 Fleet. For more information, see [Create an EC2 Fleet](#).
2. To configure the fleet to replace unhealthy Spot Instances, in the JSON file, for ReplaceUnhealthyInstances, enter true.

Generate an EC2 Fleet JSON configuration file

To view the full list of EC2 Fleet configuration parameters, you can generate a JSON file. For a description of each parameter, see [create-fleet](#) in the AWS CLI Command Reference.

To generate a JSON file with all possible EC2 Fleet parameters using the command line

- Use the [create-fleet](#) (AWS CLI) command and the --generate-cli-skeleton parameter to generate an EC2 Fleet JSON file, and direct the output to a file to save it.

```
aws ec2 create-fleet \
```

```
--generate-cli-skeleton input > ec2createfleet.json
```

Example output

```

Create an EC2 Fleet

To create an EC2 Fleet, you need only specify the following parameters:

- `LaunchTemplateId` or `LaunchTemplateName` – Specifies the launch template to use (which contains the parameters for the instances to launch, such as the instance type, Availability Zone, and the maximum price you're willing to pay)
- `TotalTargetCapacity` – Specifies the total target capacity for the fleet
- `DefaultTargetCapacityType` – Specifies whether the default purchasing option is On-Demand or Spot

You can specify multiple launch specifications that override the launch template. The launch specifications can vary by instance type, Availability Zone, subnet, and maximum price, and can include a different weighted capacity. Alternatively, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. For more information, see [Attribute-based instance type selection for EC2 Fleet](#).

If you do not specify a parameter, the fleet uses the default value for the parameter.

Specify the fleet parameters in a JSON file. For more information, see [Generate an EC2 Fleet JSON configuration file](#).

There is currently no console support for creating an EC2 Fleet.

To create an EC2 Fleet (AWS CLI)

- Use the [create-fleet](#) (AWS CLI) command to create an EC2 Fleet and specify the JSON file that contains the fleet configuration parameters.

```
aws ec2 create-fleet --cli-input-json file://file_name.json
```

For example configuration files, see [EC2 Fleet example configurations](#).

The following is example output for a fleet of type request or maintain.

```
{  
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"  
}
```

The following is example output for a fleet of type instant that launched the target capacity.

```
{  
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",  
    "Errors": [],  
    "Instances": [

,  
"Instances": []  
}
```

Tag an EC2 Fleet

To help categorize and manage your EC2 Fleet requests, you can tag them with custom metadata. You can assign a tag to an EC2 Fleet request when you create it, or afterward.

When you tag a fleet request, the instances and volumes that are launched by the fleet are not automatically tagged. You need to explicitly tag the instances and volumes launched by the fleet. You can choose to assign tags to only the fleet request, or to only the instances launched by the fleet, or to only the volumes attached to the instances launched by the fleet, or to all three.

 **Note**

For instant fleet types, you can tag volumes that are attached to On-Demand Instances and Spot Instances. For request or maintain fleet types, you can only tag volumes that are attached to On-Demand Instances.

For more information about how tags work, see [Tag your Amazon EC2 resources](#).

Prerequisite

Grant the user the permission to tag resources. For more information, see [Example: Tag resources](#).

To grant a user the permission to tag resources

Create a IAM policy that includes the following:

- The ec2:CreateTags action. This grants the user permission to create tags.

- The `ec2:CreateFleet` action. This grants the user permission to create an EC2 Fleet request.
- For `Resource`, we recommend that you specify `"*"`. This allows users to tag all resource types.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "TagEC2FleetRequest",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags",  
                "ec2:CreateFleet"  
            ],  
            "Resource": "*"  
    }]
```

Important

We currently do not support resource-level permissions for the `create-fleet` resource. If you specify `create-fleet` as a resource, you will get an unauthorized exception when you try to tag the fleet. The following example illustrates how *not* to set the policy.

```
{  
    "Effect": "Allow",  
    "Action": [  
        "ec2:CreateTags",  
        "ec2:CreateFleet"  
    ],  
    "Resource": "arn:aws:ec2:us-east-1:111122223333:create-fleet/*"  
}
```

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center User Guide*.

- Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.

- IAM users:

- Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.
- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

To tag a new EC2 Fleet request

To tag an EC2 Fleet request when you create it, specify the key-value pair in the [JSON file](#) used to create the fleet. The value for ResourceType must be fleet. If you specify another value, the fleet request fails.

To tag instances and volumes launched by an EC2 Fleet

To tag instances and volumes when they are launched by the fleet, specify the tags in the [launch template](#) that is referenced in the EC2 Fleet request.

 **Note**

You can't tag volumes attached to Spot Instances that are launched by a request or maintain fleet type.

To tag an existing EC2 Fleet request, instance, and volume (AWS CLI)

Use the [create-tags](#) command to tag existing resources.

```
aws ec2 create-tags \
--resources fleet-12a34b55-67cd-8ef9-
ba9b-9208dEXAMPLE i-1234567890abcdef0 vol-1234567890EXAMPLE \
--tags Key=purpose,Value=test
```

Describe your EC2 Fleet

You can describe your EC2 Fleet configuration, the instances in your EC2 Fleet, and the event history of your EC2 Fleet.

To describe your EC2 Fleets (AWS CLI)

Use the [describe-fleets](#) command to describe your EC2 Fleets.

```
aws ec2 describe-fleets
```

Important

If a fleet is of type instant, you must specify the fleet ID, otherwise it does not appear in the response. Include --fleet-ids as follows:

```
aws ec2 describe-fleets --fleet-ids fleet-8a22eeee4-f489-ab02-06b8-832a7EXAMPLE
```

Example output

```
{  
    "Fleets": [  
        {  
            "ActivityStatus": "fulfilled",  
            "CreateTime": "2022-02-09T03:35:52+00:00",  
            "FleetId": "fleet-364457cd-3a7a-4ed9-83d0-7b63e51bb1b7",  
            "FleetState": "active",  
            "ExcessCapacityTerminationPolicy": "termination",  
            "FulfilledCapacity": 2.0,  
            "FulfilledOnDemandCapacity": 0.0,  
            "LaunchTemplateConfigs": [  
                {  
                    "LaunchTemplateSpecification": {  
                        "LaunchTemplateName": "my-launch-template",  
                        "Version": "$Latest"  
                    }  
                }  
            ],  
            "TargetCapacitySpecification": {  
                "TotalTargetCapacity": 2,  
                "OnDemandTargetCapacity": 0,  
                "SpotTargetCapacity": 2,  
                "DefaultTargetCapacityType": "spot"  
            },  
            "TerminateInstancesWithExpiration": false,  
        }  
    ]  
}
```

```
        "Type": "maintain",
        "ReplaceUnhealthyInstances": false,
        "SpotOptions": {
            "AllocationStrategy": "capacity-optimized",
            "InstanceInterruptionBehavior": "terminate"
        },
        "OnDemandOptions": {
            "AllocationStrategy": "lowestPrice"
        }
    }
]
```

Use the [describe-fleet-instances](#) command to describe the instances for the specified EC2 Fleet. The returned list of running instances is refreshed periodically and might be out of date.

```
aws ec2 describe-fleet-instances --fleet-id fleet-73fb2ce-aa30-494c-8788-1cee4EXAMPLE
```

Example output

```
{
    "ActiveInstances": [
        {
            "InstanceId": "i-09cd595998cb3765e",
            "InstanceHealth": "healthy",
            "InstanceType": "m4.large",
            "SpotInstanceRequestId": "sir-86k84j6p"
        },
        {
            "InstanceId": "i-09cf95167ca219f17",
            "InstanceHealth": "healthy",
            "InstanceType": "m4.large",
            "SpotInstanceRequestId": "sir-dvxi7fsm"
        }
    ],
    "FleetId": "fleet-73fb2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

Use the [describe-fleet-history](#) command to describe the history for the specified EC2 Fleet for the specified time.

```
aws ec2 describe-fleet-history --fleet-id fleet-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE --  
start-time 2018-04-10T00:00:00Z
```

Example output

```
{  
    "HistoryRecords": [  
        {  
            "EventInformation": {  
                "EventSubType": "submitted"  
            },  
            "EventType": "fleetRequestChange",  
            "Timestamp": "2020-09-01T18:26:05.000Z"  
        },  
        {  
            "EventInformation": {  
                "EventSubType": "active"  
            },  
            "EventType": "fleetRequestChange",  
            "Timestamp": "2020-09-01T18:26:15.000Z"  
        },  
        {

}
```

Modify an EC2 Fleet

You can modify an EC2 Fleet that is in the submitted or active state. When you modify a fleet, it enters the modifying state.

You can only modify an EC2 Fleet that is of type `maintain`. You cannot modify an EC2 Fleet of type `request` or `instant`.

You can modify the following parameters of an EC2 Fleet:

- `target-capacity-specification` – Increase or decrease the target capacity for `TotalTargetCapacity`, `OnDemandTargetCapacity`, and `SpotTargetCapacity`.
- `excess-capacity-termination-policy` – Whether running instances should be terminated if the total target capacity of the EC2 Fleet is decreased below the current size of the fleet. Valid values are `no-termination` and `termination`.

When you increase the target capacity, the EC2 Fleet launches the additional instances according to the instance purchasing option specified for `DefaultTargetCapacityType`, which are either On-Demand Instances or Spot Instances.

If the `DefaultTargetCapacityType` is spot, the EC2 Fleet launches the additional Spot Instances according to its allocation strategy. If the allocation strategy is `lowest-price`, the fleet launches the instances from the lowest priced Spot capacity pool in the request. If the allocation strategy is `diversified`, the fleet distributes the instances across the pools in the request.

When you decrease the target capacity, the EC2 Fleet deletes any open requests that exceed the new target capacity. You can request that the fleet terminate instances until the size of the fleet reaches the new target capacity. If the allocation strategy is `lowest-price`, the fleet terminates the instances with the highest price per unit. If the allocation strategy is `diversified`, the fleet

terminates instances across the pools. Alternatively, you can request that EC2 Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or any instances that you terminate manually.

When an EC2 Fleet terminates a Spot Instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

To modify an EC2 Fleet (AWS CLI)

Use the [modify-fleet](#) command to update the target capacity of the specified EC2 Fleet.

```
aws ec2 modify-fleet \
--fleet-id fleet-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity-specification TotalTargetCapacity=20
```

If you are decreasing the target capacity but want to keep the fleet at its current size, you can modify the previous command as follows.

```
aws ec2 modify-fleet \
--fleet-id fleet-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity-specification TotalTargetCapacity=10 \
--excess-capacity-termination-policy no-termination
```

Delete an EC2 Fleet

If you no longer require an EC2 Fleet, you can delete it. After you delete a fleet, all Spot requests associated with the fleet are canceled, so that no new Spot Instances are launched.

When you delete an EC2 Fleet, you must also specify if you want to terminate all of its instances. These include both On-Demand Instances and Spot Instances. For instant fleets, EC2 Fleet must terminate the instances when the fleet is deleted. A deleted instant fleet with running instances is not supported.

If you specify that the instances must be terminated when the fleet is deleted, the fleet enters the `deleted_terminating` state. Otherwise, it enters the `deleted_running` state, and the instances continue to run until they are interrupted or you terminate them manually.

Restrictions

- You can delete up to 25 fleets of type `instant` in a single request.

- You can delete up to 100 fleets of type maintain or request in a single request.
- You can delete up to 125 fleets in a single request, provided you do not exceed the quota for each fleet type, as specified above.
- If you exceed the specified number of fleets to delete, no fleets are deleted.
- Up to 1000 instances can be terminated in a single request to delete instant fleets.

To delete an EC2 Fleet and terminate its instances (AWS CLI)

Use the [delete-fleets](#) command and the --terminate-instances parameter to delete the specified EC2 Fleet and terminate its associated instances.

```
aws ec2 delete-fleets \
  --fleet-ids fleet-73fdb2ce-aa30-494c-8788-1cee4EXAMPLE \
  --terminate-instances
```

Example output

```
{
  "UnsuccessfulFleetDeletions": [],
  "SuccessfulFleetDeletions": [
    {
      "CurrentFleetState": "deleted_terminating",
      "PreviousFleetState": "active",
      "FleetId": "fleet-73fdb2ce-aa30-494c-8788-1cee4EXAMPLE"
    }
  ]
}
```

To delete an EC2 Fleet without terminating its instances (AWS CLI)

You can modify the previous command using the --no-terminate-instances parameter to delete the specified EC2 Fleet without terminating its associated instances.

Note

--no-terminate-instances is not supported for instant fleets.

```
aws ec2 delete-fleets \
```

```
--fleet-ids fleet-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--no-terminate-instances
```

Example output

```
{
    "UnsuccessfulFleetDeletions": [],
    "SuccessfulFleetDeletions": [
        {
            "CurrentFleetState": "deleted_running",
            "PreviousFleetState": "active",
            "FleetId": "fleet-4b8aaae8-dfb5-436d-a4c6-3dafa4c6b7dcEXAMPLE"
        }
    ]
}
```

Troubleshoot when a fleet fails to delete

If an EC2 Fleet fails to delete, `UnsuccessfulFleetDeletions` in the output returns the ID of the EC2 Fleet, an error code, and an error message.

The error codes are:

- `ExceededInstantFleetNumForDeletion`
- `fleetIdDoesNotExist`
- `fleetIdMalformed`
- `fleetNotInDeletableState`
- `NoTerminateInstancesNotSupported`
- `UnauthorizedOperation`
- `unexpectedError`

Troubleshooting `ExceededInstantFleetNumForDeletion`

If you try to delete more than 25 instant fleets in a single request, the `ExceededInstantFleetNumForDeletion` error is returned. The following is example output for this error.

```
{
    "UnsuccessfulFleetDeletions": [
```

```
{  
    "FleetId": "fleet-5d130460-0c26-bfd9-2c32-0100a098f625",  
    "Error": {  
        "Message": "Can't delete more than 25 instant fleets in a single  
request.",  
        "Code": "ExceededInstantFleetNumForDeletion"  
    }  
,  
{  
    "FleetId": "fleet-9a941b23-0286-5bf4-2430-03a029a07e31",  
    "Error": {  
        "Message": "Can't delete more than 25 instant fleets in a single  
request.",  
        "Code": "ExceededInstantFleetNumForDeletion"  
    }  
}  
}  
.  
.  
.  
[  
],  
"SuccessfulFleetDeletions": []  
}
```

Troubleshoot NoTerminateInstancesNotSupported

If you specify that the instances in an instant fleet must not be terminated when you delete the fleet, the `NoTerminateInstancesNotSupported` error is returned. `--no-terminate-instances` is not supported for instant fleets. The following is example output for this error.

```
{  
    "UnsuccessfulFleetDeletions": [  
        {  
            "FleetId": "fleet-5d130460-0c26-bfd9-2c32-0100a098f625",  
            "Error": {  
                "Message": "NoTerminateInstances option is not supported for  
instant fleet",  
                "Code": "NoTerminateInstancesNotSupported"  
            }  
        }  
    ],  
    "SuccessfulFleetDeletions": []  
}
```

Troubleshoot UnauthorizedOperation

If you do not have permission to terminate instances, you get the UnauthorizedOperation error when deleting a fleet that must terminate its instances. The following is the error response.

```
<Response><Errors><Error><Code>UnauthorizedOperation</Code><Message>You are not authorized to perform this operation. Encoded authorization failure message: VvuncIxj7Z_CPGNYXWqnuFV-YjByeAU66Q9752NtQ-I3-qnDLWs6JLFd KnSMMiq5s6cGqjjPtEDpsnGHzyHasFH0aRYJpaDVravow25azn6KNkUQQ1FwhJyujt2dtNCdduJfrqcFYAj1EiRMkfDht7 BHtuzDK6A560Y2nDSUiMmAB1y9UNTqaZJ9SNe5sNxKMqZaqKtjRbk02RZu5V2vn9VMk6fm2aMVHbY9JhLvGypLcMUjtJ76 VPiU5v2s- UgZ7h0p2yth6ysUdh10Ng6dBYu8_y_HtEI54invCj4CoK0qawqzMNe6rcmCQHvtCxtXsbkgyaEbcwmrm2m01- EMhekLFZeJLr DtY0pYcEl4_nWFX1wtQDCnNNCmxnJZAoJvb3VMDYpDTsxjQv1Px0DZuqWHS23YXWVyzgnLtHeRf2o4lUhGBw17mXsS07k7 PT9vrHtQiILor5VVTsjSPWg7edj__1rsnXhwPSu8gI48ZLRGrPQqFq0RmK0_QIE8N8s6NWzCK4yoX-9gDcheur0GpkprPIC </Message></Error></Errors><RequestID>89b1215c-7814-40ae-a8db-41761f43f2b0</RequestID></Response>
```

To resolve the error, you must add the `ec2:TerminateInstances` action to the IAM policy, as shown in the following example.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "DeleteFleetsAndTerminateInstances",
            "Effect": "Allow",
            "Action": [
                "ec2:DeleteFleets",
                "ec2:TerminateInstances"
            ],
            "Resource": "*"
        }
    ]
}
```

Spot Fleet

A Spot Fleet is a set of Spot Instances and optionally On-Demand Instances that is launched based on criteria that you specify. The Spot Fleet selects the Spot capacity pools that meet your needs and launches Spot Instances to meet the target capacity for the fleet. By default, Spot Fleets are set to *Maintain* target capacity by launching replacement instances after Spot Instances in the fleet are terminated. You can submit a Spot Fleet as a one-time *request*, which does not persist after the instances have been terminated. You can include On-Demand Instance requests in a Spot Fleet request.

Note

If you want to use a console to create a fleet that includes Spot Instances, we recommend using an Auto Scaling group rather than Spot Fleet. For more information, see [Auto Scaling groups with multiple instance types and purchase options in the Amazon EC2 Auto Scaling User Guide](#).

If you want to use the AWS CLI to create a fleet that includes Spot Instances, we recommend using either an Auto Scaling group or EC2 Fleet rather than Spot Fleet. The [RequestSpotFleet](#) API, on which Spot Fleet is based, is a legacy API with no planned investment.

For more information about the recommended APIs to use, see [Which is the best Spot request method to use?](#)

Topics

- [Spot Fleet request types](#)
- [Spot Fleet configuration strategies](#)
- [Work with Spot Fleets](#)
- [CloudWatch metrics for Spot Fleet](#)
- [Automatic scaling for Spot Fleet](#)

Spot Fleet request types

There are two types of Spot Fleet requests:

request

If you configure the request type as `request`, Spot Fleet places an asynchronous one-time request for your desired capacity. Thereafter, if capacity is diminished because of Spot interruptions, the fleet does not attempt to replenish Spot Instances, nor does it submit requests in alternative Spot capacity pools if capacity is unavailable.

maintain

If you configure the request type as `maintain`, Spot Fleet places an asynchronous request for your desired capacity, and maintains capacity by automatically replenishing any interrupted Spot Instances.

To specify the type of request in the Amazon EC2 console, do the following when creating a Spot Fleet request:

- To create a Spot Fleet of type `request`, clear the **Maintain target capacity** check box.
- To create a Spot Fleet of type `maintain`, select the **Maintain target capacity** check box.

For more information, see [Create a Spot Fleet request using defined parameters \(console\)](#).

Both types of requests benefit from an allocation strategy. For more information, see [Allocation strategies for Spot Instances](#).

Spot Fleet configuration strategies

A *Spot Fleet* is a collection, or fleet, of Spot Instances, and optionally On-Demand Instances.

The Spot Fleet attempts to launch the number of Spot Instances and On-Demand Instances to meet the target capacity that you specified in the Spot Fleet request. The request for Spot Instances is fulfilled if there is available capacity and the maximum price you specified in the request exceeds the current Spot price. The Spot Fleet also attempts to maintain its target capacity fleet if your Spot Instances are interrupted.

You can also set a maximum amount per hour that you're willing to pay for your fleet, and Spot Fleet launches instances until it reaches the maximum amount. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity.

A *Spot capacity pool* is a set of unused EC2 instances with the same instance type (for example, `m5.large`), operating system, Availability Zone, and network platform. When you make a Spot Fleet request, you can include multiple launch specifications, that vary by instance type, AMI, Availability Zone, or subnet. The Spot Fleet selects the Spot capacity pools that are used to fulfill the request, based on the launch specifications included in your Spot Fleet request, and the configuration of the Spot Fleet request. The Spot Instances come from the selected pools.

- [Allocation strategies for Spot Instances](#)
- [Attribute-based instance type selection for Spot Fleet](#)
- [On-Demand in Spot Fleet](#)
- [Capacity Rebalancing](#)
- [Spot price overrides](#)
- [Control spending](#)
- [Spot Fleet instance weighting](#)

Plan a Spot Fleet request

Before you create a Spot Fleet request, review [Spot Best Practices](#). Use these best practices when you plan your Spot Fleet request so that you can provision the type of instances you want at the lowest possible price. We also recommend that you do the following:

- Determine whether you want to create a Spot Fleet that submits a one-time request for the desired target capacity, or one that maintains a target capacity over time.
- Determine the instance types that meet your application requirements.
- Determine the target capacity for your Spot Fleet request. You can set the target capacity in instances or in custom units. For more information, see [Spot Fleet instance weighting](#).
- Determine what portion of the Spot Fleet target capacity must be On-Demand capacity. You can specify 0 for On-Demand capacity.
- Determine your price per unit, if you are using instance weighting. To calculate the price per unit, divide the price per instance hour by the number of units (or weight) that this instance represents. If you are not using instance weighting, the default price per unit is the price per instance hour.

- Review the possible options for your Spot Fleet request. For more information, see the [request-spot-fleet](#) command in the *AWS CLI Command Reference*. For additional examples, see [Spot Fleet example configurations](#).

Allocation strategies for Spot Instances

Your launch configuration determines all the possible Spot capacity pools (instance types and Availability Zones) from which Spot Fleet can launch Spot Instances. However, when launching instances, Spot Fleet uses the allocation strategy that you specify to pick the specific pools from all your possible pools.

Allocation strategies

You can specify one of the following allocation strategies for your Spot Instances:

`priceCapacityOptimized` (recommended)

Spot Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. Spot Fleet then requests Spot Instances from the lowest priced of these pools.

The `priceCapacityOptimized` allocation strategy is the best choice for most Spot workloads, such as stateless containerized applications, microservices, web applications, data and analytics jobs, and batch processing.

`capacityOptimized`

Spot Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. You can optionally set a priority for each instance type in your fleet using `capacityOptimizedPrioritized`. Spot Fleet optimizes for capacity first, but honors instance type priorities on a best-effort basis.

With Spot Instances, pricing changes slowly over time based on long-term trends in supply and demand, but capacity fluctuates in real time. The `capacityOptimized` strategy automatically launches Spot Instances into the most available pools by looking at real-time capacity data and predicting which are the most available. This works well for workloads that may have a higher cost of interruption associated with restarting work, such as long Continuous Integration (CI), image and media rendering, Deep Learning, and High Performance Compute (HPC) workloads.

that may have a higher cost of interruption associated with restarting work. By offering the possibility of fewer interruptions, the capacityOptimized strategy can lower the overall cost of your workload.

Alternatively, you can use the capacityOptimizedPrioritized allocation strategy with a priority parameter to order instance types from highest to lowest priority. You can set the same priority for different instance types. Spot Fleet will optimize for capacity first, but will honor instance type priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect Spot Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters. Using priorities is supported only if your fleet uses a launch template. Note that when you set the priority for capacityOptimizedPrioritized, the same priority is also applied to your On-Demand Instances if the On-Demand AllocationStrategy is set to prioritized.

diversified

The Spot Instances are distributed across all pools.

lowestPrice

The Spot Instances come from the lowest priced pool that has available capacity. This is the default strategy. However, we recommend that you override the default by specifying the priceCapacityOptimized allocation strategy.

If the lowest priced pool doesn't have available capacity, the Spot Instances come from the next lowest priced pool that has available capacity.

If a pool runs out of capacity before fulfilling your desired capacity, Spot Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your desired capacity is met, you might receive Spot Instances from several pools.

Because this strategy only considers instance price and not capacity availability, it might lead to high interruption rates.

InstancePoolsToUseCount

The number of Spot pools across which to allocate your target Spot capacity. Valid only when the allocation strategy is set to lowestPrice. Spot Fleet selects the lowest priced Spot pools and evenly allocates your target Spot capacity across the number of Spot pools that you specify.

Note that Spot Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, Spot Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Choose an appropriate allocation strategy

You can optimize your fleet for your use case by choosing the appropriate Spot allocation strategy. For On-Demand Instance target capacity, Spot Fleet always selects the least expensive instance type based on the public On-Demand price, while following the allocation strategy—either `priceCapacityOptimized`, `capacityOptimized`, `diversified`, or `lowestPrice`—for Spot Instances.

Balance lowest price and capacity availability

To balance the trade-offs between the lowest priced Spot capacity pools and the Spot capacity pools with the highest capacity availability, we recommend that you use the `priceCapacityOptimized` allocation strategy. This strategy makes decisions about which pools to request Spot Instances from based on both the price of the pools and the capacity availability of Spot Instances in those pools. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term, while still taking price into consideration.

If your fleet runs resilient and stateless workloads, including containerized applications, microservices, web applications, data and analytics jobs, and batch processing, then use the `priceCapacityOptimized` allocation strategy for optimal cost savings and capacity availability.

If your fleet runs workloads that might have a higher cost of interruption associated with restarting work, then you should implement checkpointing so that applications can restart from that point if they're interrupted. By using checkpointing, you make the `priceCapacityOptimized` allocation strategy a good fit for these workloads because it allocates capacity from the lowest priced pools that also offer a low Spot Instance interruption rate.

For an example configuration that uses the `priceCapacityOptimized` allocation strategy, see [Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities](#).

When workloads have a high cost of interruption

You can optionally use the `capacityOptimized` strategy if you run workloads that either use similarly priced instance types, or where the cost of interruption is so significant that any cost saving is inadequate in comparison to a marginal increase in interruptions. This strategy allocates capacity from the most available Spot capacity pools that offer the possibility of fewer interruptions, which can lower the overall cost of your workload. For an example configuration that uses the `capacityOptimized` allocation strategy, see [Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances](#).

When the possibility of interruptions must be minimized but the preference for certain instance types matters, you can express your pool priorities by using the `capacityOptimizedPrioritized` allocation strategy and then setting the order of instance types to use from highest to lowest priority. For an example configuration, see [Example 9: Launch Spot Instances in a capacity-optimized fleet](#).

Note that using priorities is supported only if your fleet uses a launch template. Also note that when you set priorities for `capacityOptimizedPrioritized`, the same priorities are also applied to your On-Demand Instances if the On-Demand AllocationStrategy is set to prioritized.

When your workload is time flexible and capacity availability is not a factor

If your fleet is small or runs for a short time, you can use `priceCapacityOptimized` to maximize cost savings while still considering capacity availability.

If your workload is time flexible and capacity availability is not a factor, you can optionally use the `lowestPrice` allocation strategy to maximize cost savings. Note, however, that because the `lowestPrice` allocation strategy only considers instance price and not capacity availability, it might lead to high Spot Instance interruption rates.

When your fleet is large or runs for a long time

If your fleet is large or runs for a long time, you can improve the availability of your fleet by distributing the Spot Instances across multiple pools using the `diversified` strategy. For example, if your Spot Fleet specifies 10 pools and a target capacity of 100 instances, the fleet launches 10 Spot Instances in each pool. If the Spot price for one pool exceeds your maximum price for this pool, only 10% of your fleet is affected. Using this strategy also makes your fleet less sensitive to increases in the Spot price in any one pool over time. With the `diversified` strategy,

the Spot Fleet does not launch Spot Instances into any pools with a Spot price that is equal to or higher than the [On-Demand price](#).

To create an inexpensive and diversified fleet, use the `lowestPrice` strategy in combination with `InstancePoolsToUseCount`. For example, if your target capacity is 10 Spot Instances, and you specify 2 Spot capacity pools (for `InstancePoolsToUseCount`), Spot Fleet will draw on the two lowest priced pools to fulfill your Spot capacity.

You can use a low or high number of Spot capacity pools across which to allocate your Spot Instances. For example, if you run batch processing, we recommend specifying a low number of Spot capacity pools (for example, `InstancePoolsToUseCount=2`) to ensure that your queue always has compute capacity while maximizing savings. If you run a web service, we recommend specifying a high number of Spot capacity pools (for example, `InstancePoolsToUseCount=10`) to minimize the impact if a Spot capacity pool becomes temporarily unavailable.

Note that Spot Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, Spot Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Maintain target capacity

After Spot Instances are terminated due to a change in the Spot price or available capacity of a Spot capacity pool, a Spot Fleet of type `maintain` launches replacement Spot Instances. The allocation strategy determines the pools from which the replacement instances are launched, as follows:

- If the allocation strategy is `priceCapacityOptimized`, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability while also taking price into consideration and identifying lowest priced pools with high capacity availability.
- If the allocation strategy is `capacityOptimized`, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability.
- If the allocation strategy is `diversified`, the fleet distributes the replacement Spot Instances across the remaining pools.
- If the allocation strategy is `lowestPrice`, the fleet launches replacement instances in the pool where the Spot price is currently the lowest.

- If the allocation strategy is `lowestPrice` in combination with `InstancePoolsToUseCount`, the fleet selects the Spot capacity pools with the lowest price and launches Spot Instances across the number of Spot capacity pools that you specify.

Attribute-based instance type selection for Spot Fleet

When you create a Spot Fleet, you must specify one or more instance types for configuring the On-Demand Instances and Spot Instances in the fleet. As an alternative to manually specifying the instance types, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. This is known as *attribute-based instance type selection*. For example, you can specify the minimum and maximum number of vCPUs required for your instances, and Spot Fleet will launch the instances using any available instance types that meet those vCPU requirements.

Attribute-based instance type selection is ideal for workloads and frameworks that can be flexible about what instance types they use, such as when running containers or web fleets, processing big data, and implementing continuous integration and deployment (CI/CD) tooling.

Benefits

Attribute-based instance type selection has the following benefits:

- **Easily use the right instance types** – With so many instance types available, finding the right instance types for your workload can be time consuming. When you specify instance attributes, the instance types will automatically have the required attributes for your workload.
- **Simplified configuration** – To manually specify multiple instance types for a Spot Fleet, you must create a separate launch template override for each instance type. But with attribute-based instance type selection, to provide multiple instance types, you need only specify the instance attributes in the launch template or in a launch template override.
- **Automatic use of new instance types** – When you specify instance attributes rather than instance types, your fleet can use newer generation instance types as they're released, "future proofing" the fleet's configuration.
- **Instance type flexibility** – When you specify instance attributes rather than instance types, Spot Fleet can select from a wide range of instance types for launching Spot Instances, which adheres to the [Spot best practice of instance type flexibility](#).

Topics

- [How attribute-based instance type selection works](#)
- [Price protection](#)
- [Considerations](#)
- [Create a Spot Fleet with attribute-based instance type selection](#)
- [Examples of configurations that are valid and not valid](#)
- [Preview instance types with specified attributes](#)

How attribute-based instance type selection works

To use attribute-based instance type selection in your fleet configuration, you replace the list of instance types with a list of instance attributes that your instances require. Spot Fleet will launch instances on any available instance types that have the specified instance attributes.

Topics

- [Types of instance attributes](#)
- [Where to configure attribute-based instance type selection](#)
- [How Spot Fleet uses attribute-based instance type selection when provisioning a fleet](#)

Types of instance attributes

There are several instance attributes that you can specify to express your compute requirements, such as:

- **vCPU count** – The minimum and maximum number of vCPUs per instance.
- **Memory** – The minimum and maximum GiBs of memory per instance.
- **Local storage** – Whether to use EBS or instance store volumes for local storage.
- **Burstable performance** – Whether to use the T instance family, including T4g, T3a, T3, and T2 types.

For a description of each attribute and the default values, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

Where to configure attribute-based instance type selection

Depending on whether you use the console or the AWS CLI, you can specify the instance attributes for attribute-based instance type selection as follows:

In the console, you can specify the instance attributes in one or both of the following fleet configuration components:

- In a launch template, and then reference the launch template in the fleet request
- In the fleet request

In the AWS CLI, you can specify the instance attributes in one or all of the following fleet configuration components:

- In a launch template, and reference the launch template in the fleet request
- In a launch template override

If you want a mix of instances that use different AMIs, you can specify instance attributes in multiple launch template overrides. For example, different instance types can use x86 and Arm-based processors.

- In a launch specification

How Spot Fleet uses attribute-based instance type selection when provisioning a fleet

Spot Fleet provisions a fleet in the following way:

- Spot Fleet identifies the instance types that have the specified attributes.
- Spot Fleet uses price protection to determine which instance types to exclude.
- Spot Fleet determines the capacity pools from which it will consider launching the instances based on the AWS Regions or Availability Zones that have matching instance types.
- Spot Fleet applies the specified allocation strategy to determine from which capacity pools to launch the instances.

Note that attribute-based instance type selection does not pick the capacity pools from which to provision the fleet; that's the job of the allocation strategies. There might be a large number of instance types with the specified attributes, and some of them might be expensive. The default allocation strategy of `lowestPrice` for Spot and On-Demand guarantees that Spot Fleet will launch instances from the least expensive capacity pools.

If you specify an allocation strategy, Spot Fleet will launch instances according to the specified allocation strategy.

- For Spot Instances, attribute-based instance type selection supports the `capacityOptimizedPrioritized`, `capacityOptimized` and `lowestPrice` allocation strategies.
- For On-Demand Instances, attribute-based instance type selection supports the `lowestPrice` allocation strategy.
- If there is no capacity for the instance types with the specified instance attributes, no instances can be launched, and the fleet returns an error.

Price protection

Price protection is a feature that prevents your Spot Fleet from using instance types that you would consider too expensive even if they happen to fit the attributes that you specified. To use price protection, you set a price threshold. Then, when Amazon EC2 selects instance types with your attributes, it excludes instance types priced above your threshold.

The way that Amazon EC2 calculates the price threshold is as follows:

- Amazon EC2 first identifies the lowest priced instance type from those that match your attributes.
- Amazon EC2 then takes the value (expressed as a percentage) that you specified for the price protection parameter and multiplies it with the price of the identified instance type. The result is the price that is used as the price threshold.

There are separate price thresholds for On-Demand Instances and Spot Instances.

When you create a fleet with attribute-based instance type selection, price protection is enabled by default. You can keep the default values, or you can specify your own.

You can also turn off price protection. To indicate no price protection threshold, specify a high percentage value, such as 999999.

Topics

- [How the lowest priced instance type is identified](#)
- [On-Demand Instance price protection](#)
- [Spot Instance price protection](#)
- [Specify the price protection threshold](#)

How the lowest priced instance type is identified

Amazon EC2 determines the price to base the price threshold on by identifying the instance type with the lowest price from those that match your specified attributes. It does this in the following way:

- It first looks at the current generation C, M, or R instance types that match your attributes. If it finds any matches, it identifies the lowest priced instance type.
- If there is no match, it then looks at any current generation instance types that match your attributes. If it finds any matches, it identifies the lowest priced instance type.
- If there is no match, it then looks at any previous generation instance types that match your attributes, and identifies the lowest priced instance type.

On-Demand Instance price protection

The price protection threshold for On-Demand instance types is calculated *as a percentage higher* than the identified lowest priced On-Demand instance type (`OnDemandMaxPricePercentageOverLowestPrice`). You specify the percentage higher that you're willing to pay. If you don't specify this parameter, then a default value of 20 is used to calculate a price protection threshold of 20% higher than the identified price.

For example, if the identified On-Demand instance price is `0.4271`, and you specify `25`, then the price threshold is 25% more than `0.4271`. It is calculated as follows: $0.4271 * 1.25 = 0.533875$. The calculated price is the maximum you're willing to pay for On-Demand Instances, and, in this example, Amazon EC2 will exclude any On-Demand instance types that cost more than `0.533875`.

Spot Instance price protection

By default, Amazon EC2 will automatically apply optimal Spot Instance price protection to consistently select from a wide range of instance types. You can also manually set the price protection yourself. However, letting Amazon EC2 do it for you can improve the likelihood that your Spot capacity is fulfilled.

You can manually specify the price protection using one of the following options. If you manually set the price protection, we recommend using the first option.

- **A *percentage of the identified lowest priced On-Demand instance type***
[`MaxSpotPriceAsPercentageOfOptimalOnDemandPrice`]

For example, if the identified On-Demand instance type price is `0.4271`, and you specify `60`, then the price threshold is `60%` of `0.4271`. It is calculated as follows: $0.4271 * 0.60 = 0.25626$. The calculated price is the maximum you're willing to pay for Spot Instances, and, in this example, Amazon EC2 will exclude any Spot instance types that cost more than `0.25626`.

- **A percentage higher than the identified lowest priced Spot instance type**

[`SpotMaxPricePercentageOverLowestPrice`]

For example, if the identified Spot instance type price is `0.1808`, and you specify `25`, then the price threshold is `25%` more than `0.1808`. It is calculated as follows: $0.1808 * 1.25 = 0.226$. The calculated price is the maximum you're willing to pay for Spot Instances, and, in this example, Amazon EC2 will exclude any Spot instance types that cost more than `0.226`. We do not recommend using this parameter because Spot prices can fluctuate, and therefore your price protection threshold might also fluctuate.

Specify the price protection threshold

To specify the price protection threshold

While creating the Spot Fleet, configure the fleet for attribute-based instance type selection, and then do the following:

- Console

To specify the On-Demand Instance price protection threshold, under **Additional instance attribute**, choose **On-demand price protection**, and then choose **Add attribute**. For **On-Demand price protection percentage**, enter the price protection threshold as a percentage.

To specify the Spot Instance price protection threshold, under **Additional instance attribute**, choose **Spot price protection**, and then choose **Add attribute**. Choose a parameter and enter the price protection threshold as a percentage.

- AWS CLI

To specify the On-Demand Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, for `OnDemandMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.

To specify the Spot Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, specify *one* of the following parameters:

- For `MaxSpotPriceAsPercentageOfOptimalOnDemandPrice`, enter the price protection threshold as a percentage.
- For `SpotMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.

For more information about creating the fleet, see [Create a Spot Fleet with attribute-based instance type selection](#).

 **Note**

When creating the Spot Fleet, if you set **Total target capacity** type to **vCPUs or Memory (MiB)** (console) or `TargetCapacityUnitType` to `vcpu` or `memory-mib` (AWS CLI), the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

Considerations

- You can specify either instance types or instance attributes in a Spot Fleet, but not both at the same time.

When using the CLI, the launch template overrides will override the launch template. For example, if the launch template contains an instance type and the launch template override contains instance attributes, the instances that are identified by the instance attributes will override the instance type in the launch template.

- When using the CLI, when you specify instance attributes as overrides, you can't also specify weights or priorities.
- You can specify a maximum of four `InstanceRequirements` structures in a request configuration.

Create a Spot Fleet with attribute-based instance type selection

You can configure a fleet to use attribute-based instance type selection by using the Amazon EC2 console or the AWS CLI.

Topics

- [Create a Spot Fleet using the console](#)
- [Create a Spot Fleet using the AWS CLI](#)

Create a Spot Fleet using the console

To configure a Spot Fleet for attribute-based instance type selection (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**, and then choose **Request Spot Instances**.
3. Follow the steps to create a Spot Fleet. For more information, see [Create a Spot Fleet request using defined parameters \(console\)](#).

While creating the Spot Fleet, configure the fleet for attribute-based instance type selection as follows:

- a. For **Instance type requirements**, choose **Specify instance attributes that match your compute requirements**.
- b. For **vCPUs**, enter the desired minimum and maximum number of vCPUs. To specify no limit, select **No minimum**, **No maximum**, or both.
- c. For **Memory (GiB)**, enter the desired minimum and maximum amount of memory. To specify no limit, select **No minimum**, **No maximum**, or both.
- d. (Optional) For **Additional instance attributes**, you can optionally specify one or more attributes to express your compute requirements in more detail. Each additional attribute adds further constraints to your request.
- e. (Optional) Expand **Preview matching instance types** to view the instance types that have your specified attributes.

Create a Spot Fleet using the AWS CLI

To configure a Spot Fleet for attribute-based instance type selection (AWS CLI)

Use the [request-spot-fleet](#) (AWS CLI) command to create a Spot Fleet. Specify the fleet configuration in a JSON file.

```
aws ec2 request-spot-fleet \
--region us-east-1 \
```

```
--spot-fleet-request-config file://file_name.json
```

Example *file_name*.json file

The following example contains the parameters that configure a Spot Fleet to use attribute-based instance type selection, and is followed by a text explanation.

```
{  
    "AllocationStrategy": "priceCapacityOptimized",  
    "TargetCapacity": 20,  
    "Type": "request",  
    "LaunchTemplateConfigs": [  
        {"LaunchTemplateSpecification": {  
            "LaunchTemplateName": "my-launch-template",  
            "Version": "1"  
        },  
        "Overrides": [  
            {"InstanceRequirements": {  
                "VCpuCount": {  
                    "Min": 2  
                },  
                "MemoryMiB": {  
                    "Min": 4  
                }  
            }  
        ]  
    ]  
}
```

The attributes for attribute-based instance type selection are specified in the `InstanceRequirements` structure. In this example, two attributes are specified:

- `VCpuCount` – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- `MemoryMiB` – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when [Spot Fleet provisions the fleet](#).

For a list and descriptions of all the possible attributes that you can specify, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

 **Note**

When `InstanceRequirements` is included in the fleet configuration, `InstanceType` and `WeightedCapacity` must be excluded; they cannot determine the fleet configuration at the same time as instance attributes.

The JSON also contains the following fleet configuration:

- "AllocationStrategy": "*priceCapacityOptimized*" – The allocation strategy for the Spot Instances in the fleet.
- "LaunchTemplateName": "*my-launch-template*", "Version": "1" – The launch template contains some instance configuration information, but if any instance types are specified, they will be overridden by the attributes that are specified in `InstanceRequirements`.
- "TargetCapacity": 20 – The target capacity is 20 instances.
- "Type": "*request*" – The request type for the fleet is `request`.

Examples of configurations that are valid and not valid

If you use the AWS CLI to create a Spot Fleet, you must make sure that your fleet configuration is valid. The following examples show configurations that are valid and not valid.

Configurations are considered not valid when they contain the following:

- A single `Overrides` structure with both `InstanceRequirements` and `InstanceType`
- Two `Overrides` structures, one with `InstanceRequirements` and the other with `InstanceType`
- Two `InstanceRequirements` structures with overlapping attribute values within the same `LaunchTemplateSpecification`

Example configurations

- [Valid configuration: Single launch template with overrides](#)

- [Valid configuration: Single launch template with multiple InstanceRequirements](#)
- [Valid configuration: Two launch templates, each with overrides](#)
- [Valid configuration: Only InstanceRequirements specified, no overlapping attribute values](#)
- [Configuration not valid: Overrides contain InstanceRequirements and InstanceType](#)
- [Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType](#)
- [Configuration not valid: Overlapping attribute values](#)

Valid configuration: Single launch template with overrides

The following configuration is valid. It contains one launch template and one Overrides structure containing one InstanceRequirements structure. A text explanation of the example configuration follows.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-  
role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "My-launch-template",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceRequirements": {  
                            "VCpuCount": {  
                                "Min": 2,  
                                "Max": 8  
                            },  
                            "MemoryMib": {  
                                "Min": 0,  
                                "Max": 10240  
                            },  
                            "MemoryGiBPerVCpu": {  
                                "Max": 10000  
                            },  
                            "RequireHibernateSupport": true  
                        }  
                    }  
                ]  
            }  
        ]  
    }  
}
```

```
        }
    ]
}
],
    "TargetCapacity": 5000,
    "OnDemandTargetCapacity": 0,
    "TargetCapacityUnitType": "vcpu"
}
}
```

InstanceRequirements

To use attribute-based instance selection, you must include the `InstanceRequirements` structure in your fleet configuration, and specify the desired attributes for the instances in the fleet.

In the preceding example, the following instance attributes are specified:

- `VCpuCount` – The instance types must have a minimum of 2 and a maximum of 8 vCPUs.
- `MemoryMiB` – The instance types must have a maximum of 10240 MiB of memory. A minimum of 0 indicates no minimum limit.
- `MemoryGiBPerVCpu` – The instance types must have a maximum of 10,000 GiB of memory per vCPU. The `Min` parameter is optional. By omitting it, you indicate no minimum limit.

TargetCapacityUnitType

The `TargetCapacityUnitType` parameter specifies the unit for the target capacity. In the example, the target capacity is 5000 and the target capacity unit type is `vcpu`, which together specify a desired target capacity of 5,000 vCPUs. Spot Fleet will launch enough instances so that the total number of vCPUs in the fleet is 5,000 vCPUs.

Valid configuration: Single launch template with multiple InstanceRequirements

The following configuration is valid. It contains one launch template and one `Overrides` structure containing two `InstanceRequirements` structures. The attributes specified in `InstanceRequirements` are valid because the values do not overlap—the first `InstanceRequirements` structure specifies a `VCpuCount` of 0-2 vCPUs, while the second `InstanceRequirements` structure specifies 4-8 vCPUs.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "MyLaunchTemplate",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceRequirements": {  
                            "VCpuCount": {  
                                "Min": 0,  
                                "Max": 2  
                            },  
                            "MemoryMiB": {  
                                "Min": 0  
                            }  
                        }  
                    },  
                    {  
                        "InstanceRequirements": {  
                            "VCpuCount": {  
                                "Min": 4,  
                                "Max": 8  
                            },  
                            "MemoryMiB": {  
                                "Min": 0  
                            }  
                        }  
                    }  
                ]  
            }  
        ],  
        "TargetCapacity": 1,  
        "OnDemandTargetCapacity": 0,  
        "Type": "maintain"  
    }  
}
```

Valid configuration: Two launch templates, each with overrides

The following configuration is valid. It contains two launch templates, each with one Overrides structure containing one InstanceRequirements structure. This configuration is useful for arm and x86 architecture support in the same fleet.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "armLaunchTemplate",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceRequirements": {  
                            "VCpuCount": {  
                                "Min": 0,  
                                "Max": 2  
                            },  
                            "MemoryMiB": {  
                                "Min": 0  
                            }  
                        }  
                    },  
                    {  
                        "LaunchTemplateSpecification": {  
                            "LaunchTemplateName": "x86LaunchTemplate",  
                            "Version": "1"  
                        },  
                        "Overrides": [  
                            {  
                                "InstanceRequirements": {  
                                    "VCpuCount": {  
                                        "Min": 0,  
                                        "Max": 2  
                                    },  
                                    "MemoryMiB": {  
                                        "Min": 0,  
                                        "Max": 2  
                                    }  
                                }  
                            }  
                        ]  
                    }  
                ]  
            }  
        ]  
    }  
}
```

```
        "Min": 0
    }
}
]
],
"TargetCapacity": 1,
"OnDemandTargetCapacity": 0,
"Type": "maintain"
}
}
```

Valid configuration: Only InstanceRequirements specified, no overlapping attribute values

The following configuration is valid. It contains two LaunchTemplateSpecification structures, each with a launch template and an Overrides structure containing an InstanceRequirements structure. The attributes specified in InstanceRequirements are valid because the values do not overlap—the first InstanceRequirements structure specifies a VCpuCount of 0-2 vCPUs, while the second InstanceRequirements structure specifies 4-8 vCPUs.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 0,
                                "Max": 2
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    }
                ]
            }
        ]
    }
}
```

```
        }
    ]
},
{
    "LaunchTemplateSpecification": {
        "LaunchTemplateName": "MyOtherLaunchTemplate",
        "Version": "1"
    },
    "Overrides": [
        {
            "InstanceRequirements": {
                "VCpuCount": {
                    "Min": 4,
                    "Max": 8
                },
                "MemoryMiB": {
                    "Min": 0
                }
            }
        }
    ]
},
{
    "TargetCapacity": 1,
    "OnDemandTargetCapacity": 0,
    "Type": "maintain"
}
}
```

Configuration not valid: Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structure contains both InstanceRequirements and InstanceType. For the Overrides, you can specify either InstanceRequirements or InstanceType, but not both.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-
role",
        "LaunchTemplateConfigs": [

```

```
{  
    "LaunchTemplateSpecification": {  
        "LaunchTemplateName": "MyLaunchTemplate",  
        "Version": "1"  
    },  
    "Overrides": [  
        {  
            "InstanceRequirements": {  
                "VCpuCount": {  
                    "Min": 0,  
                    "Max": 2  
                },  
                "MemoryMiB": {  
                    "Min": 0  
                }  
            }  
        },  
        {  
            "InstanceType": "m5.large"  
        }  
    ]  
},  
    "TargetCapacity": 1,  
    "OnDemandTargetCapacity": 0,  
    "Type": "maintain"  
}  
}
```

Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structures contain both InstanceRequirements and InstanceType. You can specify either InstanceRequirements or InstanceType, but not both, even if they're in different Overrides structures.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-  
role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "MyLaunchTemplate",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceRequirements": {  
                            "VCpuCount": {  
                                "Min": 0,  
                                "Max": 2  
                            },  
                            "MemoryMiB": {  
                                "Min": 0  
                            }  
                        }  
                    },  
                    {  
                        "InstanceType": "m5.large"  
                    }  
                ]  
            }  
        ]  
    }  
}
```

```
        "LaunchTemplateSpecification": {

```

Preview instance types with specified attributes

You can use the [get-instance-types-from-instance-requirements](#) AWS CLI command to preview the instance types that match the attributes that you specify. This is especially useful for working out what attributes to specify in your request configuration without launching any instances. Note that the command does not consider available capacity.

To preview a list of instance types by specifying attributes using the AWS CLI

1. (Optional) To generate all of the possible attributes that can be specified, use the [get-instance-types-from-instance-requirements](#) command and the `--generate-cli-skeleton` parameter. You can optionally direct the output to a file to save it by using `input > attributes.json`.

```
aws ec2 get-instance-types-from-instance-requirements \
--region us-east-1 \
--generate-cli-skeleton input > attributes.json
```

Expected output

```
{
    "DryRun": true,
    "ArchitectureTypes": [
        "i386"
    ],
    "VirtualizationTypes": [
        "hvm"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 0,
            "Max": 0
        },
        "MemoryMiB": {
            "Min": 0,
            "Max": 0
        },
        "CpuManufacturers": [
            "intel"
        ],
        "MemoryGiBPerVCpu": {

}
```

2. Create a JSON configuration file using the output from the previous step, and configure it as follows:

 **Note**

You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. You can omit the other attributes; when omitted, the default values are used.

For a description of each attribute and their default values, see [get-instance-types-from-instance-requirements](#) in the *Amazon EC2 Command Line Reference*.

- a. For `ArchitectureTypes`, specify one or more types of processor architecture.
 - b. For `VirtualizationTypes`, specify one or more types of virtualization.
 - c. For `VCpuCount`, specify the minimum and maximum number of vCPUs. To specify no minimum limit, for `Min`, specify `0`. To specify no maximum limit, omit the `Max` parameter.
 - d. For `MemoryMiB`, specify the minimum and maximum amount of memory in MiB. To specify no minimum limit, for `Min`, specify `0`. To specify no maximum limit, omit the `Max` parameter.
 - e. You can optionally specify one or more of the other attributes to further constrain the list of instance types that are returned.
3. To preview the instance types that have the attributes that you specified in the JSON file, use the [get-instance-types-from-instance-requirements](#) command, and specify the name and path

to your JSON file by using the `--cli-input-json` parameter. You can optionally format the output to appear in a table format.

```
aws ec2 get-instance-types-from-instance-requirements \
    --cli-input-json file://attributes.json \
    --output table
```

Example *attributes.json* file

In this example, the required attributes are included in the JSON file. They are `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. In addition, the optional `InstanceGenerations` attribute is also included. Note that for `MemoryMiB`, the `Max` value can be omitted to indicate that there is no limit.

```
{  
    "ArchitectureTypes": [  
        "x86_64"  
    ],  
    "VirtualizationTypes": [  
        "hvm"  
    ],  
    "InstanceRequirements": {  
        "VCpuCount": {  
            "Min": 4,  
            "Max": 6  
        },  
        "MemoryMiB": {  
            "Min": 2048  
        },  
        "InstanceGenerations": [  
            "current"  
        ]  
    }  
}
```

Example output

```
-----  
|GetInstanceTypesFromInstanceRequirements|  
+-----+  
||      InstanceTypes      ||
```

InstanceType
c4.xlarge
c5.xlarge
c5a.xlarge
c5ad.xlarge
c5d.xlarge
c5n.xlarge
c6a.xlarge
...

- After identifying instance types that meet your needs, make note of the instance attributes that you used so that you can use them when configuring your fleet request.

On-Demand in Spot Fleet

To ensure that you always have instance capacity, you can include a request for On-Demand capacity in your Spot Fleet request. In your Spot Fleet request, you specify your desired target capacity and how much of that capacity must be On-Demand. The balance comprises Spot capacity, which is launched if there is available Amazon EC2 capacity and availability. For example, if in your Spot Fleet request you specify the target capacity as 10 and the On-Demand capacity as 8, Amazon EC2 launches 8 capacity units as On-Demand, and 2 capacity units ($10-8=2$) as Spot.

Prioritize instance types for On-Demand capacity

When Spot Fleet attempts to fulfill your On-Demand capacity, it defaults to launching the lowest priced instance type first. If `OnDemandAllocationStrategy` is set to `prioritized`, Spot Fleet uses priority to determine which instance type to use first in fulfilling On-Demand capacity.

The priority is assigned to the launch template override, and the highest priority is launched first.

Example: Prioritize instance types

In this example, you configure three launch template overrides, each with a different instance type.

The On-Demand price for the instance types range in price. The following are the instance types used in this example, listed in order of price, starting with the cheapest instance type:

- m4.large – cheapest
- m5.large

- m5a.large

If you do not use priority to determine the order, the fleet fulfills the On-Demand capacity by starting with the cheapest instance type.

However, say you have unused m5.large Reserved Instances that you want to use first. You can set the launch template override priority so that the instance types are used in the order of priority, as follows:

- m5.large – priority 1
- m4.large – priority 2
- m5a.large – priority 3

Capacity Rebalancing

You can configure Spot Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation to notify you that a Spot Instance is at an elevated risk of interruption. Capacity Rebalancing helps you maintain workload availability by proactively augmenting your fleet with a new Spot Instance before a running instance is interrupted by Amazon EC2. For more information, see [EC2 instance rebalance recommendations](#).

To configure Spot Fleet to launch a replacement Spot Instance, you can use the Amazon EC2 console or the AWS CLI.

- Amazon EC2 console: You must select the **Capacity rebalance** check box when you create the Spot Fleet. For more information, see step 6.d. in [Create a Spot Fleet request using defined parameters \(console\)](#).
- AWS CLI: Use the [request-spot-fleet](#) command and the relevant parameters in the SpotMaintenanceStrategies structure. For more information, see the [example launch configuration](#).

Limitations

- Capacity Rebalancing is available only for fleets of type maintain.
- When the fleet is running, you can't modify the Capacity Rebalancing setting. To change the Capacity Rebalancing setting, you must delete the fleet and create a new fleet.

Configuration options

The ReplacementStrategy for Spot Fleet supports the following two values:

launch-before-terminate

Amazon EC2 terminates the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched. When you specify launch-before-terminate, you must also specify a value for termination-delay. After the new replacement instances are launched, Amazon EC2 waits for the duration of the termination-delay, and then terminates the old instances. For termination-delay, the minimum is 120 seconds (2 minutes), and the maximum is 7200 seconds (2 hours).

We recommend that you use launch-before-terminate only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed. Note that Amazon EC2 can interrupt the old instances with a two-minute warning before the termination-delay.

We strongly recommend against using the lowestPrice allocation strategy in combination with launch-before-terminate to avoid having replacement Spot Instances that are also at an elevated risk of interruption.

launch

Amazon EC2 launches replacement Spot Instances when a rebalance notification is emitted for existing Spot Instances. Amazon EC2 does not terminate the instances that receive a rebalance notification. You can terminate the old instances, or you can leave them running. You are charged for all instances while they are running.

Considerations

If you configure a Spot Fleet for Capacity Rebalancing, consider the following:

Provide as many Spot capacity pools in the request as possible

Configure your Spot Fleet to use multiple instance types and Availability Zones. This provides the flexibility to launch Spot Instances in various Spot capacity pools. For more information, see [Be flexible about instance types and Availability Zones](#).

Avoid an elevated risk of interruption of replacement Spot Instances

Your replacement Spot Instances may be at an elevated risk of interruption if you use the `lowestPrice` allocation strategy. This is because Amazon EC2 will always launch instances in the lowest priced pool that has available capacity at that moment, even if your replacement Spot Instances are likely to be interrupted soon after being launched. To avoid an elevated risk of interruption, we strongly recommend against using the `lowestPrice` allocation strategy, and instead recommend the `capacityOptimized` or `capacityOptimizedPrioritized` allocation strategy. These strategies ensure that replacement Spot Instances are launched in the most optimal Spot capacity pools, and are therefore less likely to be interrupted in the near future. For more information, see [Use the price and capacity optimized allocation strategy](#).

Amazon EC2 will only launch a new instance if availability is the same or better

One of the goals of Capacity Rebalancing is to improve a Spot Instance's availability. If an existing Spot Instance receives a rebalance recommendation, Amazon EC2 will only launch a new instance if the new instance provides the same or better availability than the existing instance. If the risk of interruption of a new instance will be worse than the existing instance, then Amazon EC2 will not launch a new instance. Amazon EC2 will, however, continue to assess the Spot capacity pools, and will launch a new instance if availability improves.

There is a chance that your existing instance will be interrupted without Amazon EC2 proactively launching a new instance. When this happens, Amazon EC2 will attempt to launch a new instance regardless of whether the new instance has a high risk of interruption.

Capacity Rebalancing does not increase your Spot Instance interruption rate

When you enable Capacity Rebalancing, it does not increase your [Spot Instance interruption rate](#) (the number of Spot Instances that are reclaimed when Amazon EC2 needs the capacity back). However, if Capacity Rebalancing detects an instance is at risk of interruption, Amazon EC2 will immediately attempt to launch a new instance. The result is that more instances might be replaced than if you'd waited for Amazon EC2 to launch a new instance after the at-risk instance was interrupted.

While you might replace more instances with Capacity Rebalancing enabled, you benefit from being proactive rather than reactive by having more time to take action before your instances are interrupted. With a [Spot Instance interruption notice](#), you typically only have up to two minutes to gracefully shut down your instance. With Capacity Rebalancing launching a new instance in advance, you give existing processes a better chance of completing on your at-risk instance, you can start your instance shutdown procedures, and prevent new work from being

scheduled on your at-risk instance. You can also start preparing the newly-launched instance to take over the application. With Capacity Rebalancing's proactive replacement, you benefit from graceful continuity.

As a theoretical example to demonstrate the risks and benefits of using Capacity Rebalancing, consider the following scenario:

- 2:00 PM – A rebalance recommendation is received for instance-A, and Amazon EC2 immediately starts attempting to launch a replacement instance-B, giving you time to start your shutdown procedures.*
- 2:30 PM – A rebalance recommendation is received for instance-B, replaced with instance-C, giving you time to start your shutdown procedures.*
- 2:32 PM – If Capacity Rebalancing wasn't enabled, and if a Spot Instance interruption notice would've been received at 2:32 PM for instance-A, you would only have had up to two minutes to take action, but Instance-A would have been running up till this time.

* If `launch-before-terminate` is specified, Amazon EC2 will terminate the at-risk instance after the replacement instance comes online.

Amazon EC2 can launch new replacement Spot Instances until fulfilled capacity is double target capacity

When a Spot Fleet is configured for Capacity Rebalancing, Amazon EC2 attempts to launch a new replacement Spot Instance for every Spot Instance that receives a rebalance recommendation. After a Spot Instance receives a rebalance recommendation, it is no longer counted as part of the fulfilled capacity. Depending on the replacement strategy, Amazon EC2 either terminates the instance after a preconfigured termination delay, or leaves it running. This gives you the opportunity to perform [rebalancing actions](#) on the instance.

If your fleet reaches double its target capacity, it stops launching new replacement instances even if the replacement instances themselves receive a rebalance recommendation.

For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. All of the Spot Instances receive a rebalance recommendation, which causes Amazon EC2 to launch 100 replacement Spot Instances. This raises the number of fulfilled Spot Instances to 200, which is double the target capacity. Some of the replacement instances receive a rebalance recommendation, but no more replacement instances are launched because the fleet cannot exceed double its target capacity.

Note that you are charged for all of the instances while they are running.

We recommend that you configure Spot Fleet to terminate Spot Instances that receive a rebalance recommendation

If you configure your Spot Fleet for Capacity Rebasing, we recommend that you choose `launch-before-terminate` with an appropriate termination delay only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed.

If you choose to terminate the instances that are recommended for rebalance yourself, we recommend that you monitor the rebalance recommendation signal that is received by the Spot Instances in the fleet. By monitoring the signal, you can quickly perform [rebalancing actions](#) on the affected instances before Amazon EC2 interrupts them, and then you can manually terminate them. If you do not terminate the instances, you continue paying for them while they are running. Amazon EC2 does not automatically terminate the instances that receive a rebalance recommendation.

You can set up notifications using Amazon EventBridge or instance metadata. For more information, see [Monitor rebalance recommendation signals](#).

Spot Fleet does not count instances that receive a rebalance recommendation when calculating fulfilled capacity during scale in or out

If your Spot Fleet is configured for Capacity Rebasing, and you change the target capacity to either scale in or scale out, the fleet does not count the instances that are marked for rebalance as part of the fulfilled capacity, as follows:

- Scale in – If you decrease your desired target capacity, Amazon EC2 terminates instances that are not marked for rebalance until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so Amazon EC2 launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then reduce the target capacity to 50 (scale in), but the fulfilled capacity is actually 60 instances because the 10 instances that are marked for rebalance are not terminated by Amazon EC2. You need to manually terminate these instances, or you can leave them running.

- Scale out – If you increase your desired target capacity, Amazon EC2 launches new instances until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so Amazon EC2 launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then increase the target capacity to 200 (scale out), but the fulfilled capacity is actually 210 instances because the 10 instances that are marked for rebalance are not counted by the fleet as part of the target capacity. You need to manually terminate these instances, or you can leave them running.

Spot price overrides

Each Spot Fleet request can include a global maximum price, or use the default (the On-Demand price). Spot Fleet uses this as the default maximum price for each of its launch specifications.

You can optionally specify a maximum price in one or more launch specifications. This price is specific to the launch specification. If a launch specification includes a specific price, the Spot Fleet uses this maximum price, overriding the global maximum price. Any other launch specifications that do not include a specific maximum price still use the global maximum price.

Control spending

Spot Fleet stops launching instances when it has either reached the target capacity or the maximum amount you're willing to pay. To control the amount you pay per hour for your fleet, you can specify the `SpotMaxTotalPrice` for Spot Instances and the `OnDemandMaxTotalPrice` for On-Demand Instances. When the maximum total price is reached, Spot Fleet stops launching instances even if it hasn't met the target capacity.

The following examples show two different scenarios. In the first, Spot Fleet stops launching instances when it has met the target capacity. In the second, Spot Fleet stops launching instances when it has reached the maximum amount you're willing to pay.

Example: Stop launching instances when target capacity is reached

Given a request for `m4.large` On-Demand Instances, where:

- On-Demand Price: \$0.10 per hour
- `OnDemandTargetCapacity`: 10
- `OnDemandMaxTotalPrice`: \$1.50

Spot Fleet launches 10 On-Demand Instances because the total of \$1.00 (10 instances x \$0.10) does not exceed the `OnDemandMaxTotalPrice` of \$1.50.

Example: Stop launching instances when maximum total price is reached

Given a request for `m4.large` On-Demand Instances, where:

- On-Demand Price: \$0.10 per hour
- `OnDemandTargetCapacity`: 10
- `OnDemandMaxTotalPrice`: \$0.80

If Spot Fleet launches the On-Demand target capacity (10 On-Demand Instances), the total cost per hour would be \$1.00. This is more than the amount (\$0.80) specified for `OnDemandMaxTotalPrice`. To prevent spending more than you're willing to pay, Spot Fleet launches only 8 On-Demand Instances (below the On-Demand target capacity) because launching more would exceed the `OnDemandMaxTotalPrice`.

Spot Fleet instance weighting

When you request a fleet of Spot Instances, you can define the capacity units that each instance type would contribute to your application's performance, and adjust your maximum price for each Spot capacity pool accordingly using *instance weighting*.

By default, the price that you specify is *per instance hour*. When you use the instance weighting feature, the price that you specify is *per unit hour*. You can calculate your price per unit hour by dividing your price for an instance type by the number of units that it represents. Spot Fleet calculates the number of Spot Instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the Spot Fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity. Spot Fleet can select any pool that you specify in your launch specification, even if the capacity of the instances launched exceeds the requested target capacity.

The following tables provide examples of calculations to determine the price per unit for a Spot Fleet request with a target capacity of 10.

Instance type	Instance weight	Price per instance hour	Price per unit hour	Number of instances launched
r3.xlarge	2	\$0.05	.025 (.05 divided by 2)	5 (10 divided by 2)

Instance type	Instance weight	Price per instance hour	Price per unit hour	Number of instances launched
r3.8xlarge	8	\$0.10	.0125 (.10 divided by 8)	2 (10 divided by 8, result rounded up)

Use Spot Fleet instance weighting as follows to provision the target capacity that you want in the pools with the lowest price per unit at the time of fulfillment:

1. Set the target capacity for your Spot Fleet either in instances (the default) or in the units of your choice, such as virtual CPUs, memory, storage, or throughput.
2. Set the price per unit.
3. For each launch configuration, specify the weight, which is the number of units that the instance type represents toward the target capacity.

Instance weighting example

Consider a Spot Fleet request with the following configuration:

- A target capacity of 24
- A launch specification with an instance type r3.2xlarge and a weight of 6
- A launch specification with an instance type c3.xlarge and a weight of 5

The weights represent the number of units that instance type represents toward the target capacity. If the first launch specification provides the lowest price per unit (price for `r3.2xlarge` per instance hour divided by 6), the Spot Fleet would launch four of these instances (24 divided by 6).

If the second launch specification provides the lowest price per unit (price for `c3.xlarge` per instance hour divided by 5), the Spot Fleet would launch five of these instances (24 divided by 5, result rounded up).

Instance weighting and allocation strategy

Consider a Spot Fleet request with the following configuration:

- A target capacity of 30
- A launch specification with an instance type `c3.2xlarge` and a weight of 8
- A launch specification with an instance type `m3.xlarge` and a weight of 8
- A launch specification with an instance type `r3.xlarge` and a weight of 8

The Spot Fleet would launch four instances (30 divided by 8, result rounded up). With the `lowestPrice` strategy, all four instances come from the pool that provides the lowest price per unit. With the `diversified` strategy, the Spot Fleet launches one instance in each of the three pools, and the fourth instance in whichever pool provides the lowest price per unit.

Work with Spot Fleets

To start using a Spot Fleet, you create a Spot Fleet request that includes the target capacity, an optional On-Demand portion, one or more launch specifications for the instances, and the maximum price that you are willing to pay. The fleet request must include a launch specification that defines the information that the fleet needs to launch an instance, such as an AMI, instance type, subnet or Availability Zone, and one or more security groups.

If your fleet includes Spot Instances, Amazon EC2 can attempt to maintain your fleet target capacity as Spot prices change.

It is not possible to modify the target capacity of a one-time request after it's been submitted. To change the target capacity, cancel the request and submit a new one.

A Spot Fleet request remains active until it expires or you cancel it. When you cancel a fleet request, you can specify whether canceling the request terminates the Spot Instances in that fleet.

Spot Fleet request states

A Spot Fleet request can be in one of the following states:

- submitted – The Spot Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances. If a request would exceed your Spot Fleet limits, it is canceled immediately.
- active – The Spot Fleet has been validated and Amazon EC2 is attempting to maintain the target number of running Spot Instances. The request remains in this state until it is modified or canceled.
- modifying – The Spot Fleet request is being modified. The request remains in this state until the modification is fully processed or the Spot Fleet is canceled. A one-time request cannot be modified, and this state does not apply to such Spot requests.
- cancelled_running – The Spot Fleet is canceled and does not launch additional Spot Instances. Its existing Spot Instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.
- cancelled_terminating – The Spot Fleet is canceled and its Spot Instances are terminating. The request remains in this state until all instances are terminated.
- cancelled – The Spot Fleet is canceled and has no running Spot Instances. The Spot Fleet request is deleted two days after its instances were terminated.

Spot Fleet health checks

Spot Fleet checks the health status of the Spot Instances in the fleet every two minutes. The health status of an instance is either healthy or unhealthy.

Spot Fleet determines the health status of an instance by using the status checks provided by Amazon EC2. An instance is determined as unhealthy when the status of either the instance status check or the system status check is impaired for three consecutive health checks. For more information, see [Status checks for your instances](#).

You can configure your fleet to replace unhealthy Spot Instances. After enabling health check replacement, a Spot Instance is replaced when it is reported as unhealthy. The fleet could go below its target capacity for up to a few minutes while an unhealthy Spot Instance is being replaced.

Requirements

- Health check replacement is supported only for Spot Fleets that maintain a target capacity (fleets of type `maintain`), not for one-time Spot Fleets (fleets of type `request`).
- Health check replacement is supported only for Spot Instances. This feature is not supported for On-Demand Instances.
- You can configure your Spot Fleet to replace unhealthy instances only when you create it.
- Users can use health check replacement only if they have permission to call the `ec2:DescribeInstanceStatus` action.

Console

To configure a Spot Fleet to replace unhealthy Spot Instances using the console

1. Follow the steps for creating a Spot Fleet. For more information, see [Create a Spot Fleet request using defined parameters \(console\)](#).
2. To configure the fleet to replace unhealthy Spot Instances, for **Health check**, choose **Replace unhealthy instances**. To enable this option, you must first choose **Maintain target capacity**.

AWS CLI

To configure a Spot Fleet to replace unhealthy Spot Instances using the AWS CLI

1. Follow the steps for creating a Spot Fleet. For more information, see [Create a Spot Fleet using the AWS CLI](#).
2. To configure the fleet to replace unhealthy Spot Instances, for ReplaceUnhealthyInstances, enter true.

Spot Fleet permissions

If your users will create or manage a Spot Fleet, you need to grant them the required permissions.

If you use the Amazon EC2 console to create a Spot Fleet, it creates two service-linked roles named AWSServiceRoleForEC2SpotFleet and AWSServiceRoleForEC2Spot, and a role named aws-ec2-spot-fleet-tagging-role that grant the Spot Fleet the permissions to request, launch, terminate, and tag resources on your behalf. If you use the AWS CLI or an API, you must ensure that these roles exist.

Use the following instructions to grant the required permissions and create the roles.

Permissions and roles

- [Grant permission to users for Spot Fleet](#)
- [Service-linked role for Spot Fleet](#)
- [Service-linked role for Spot Instances](#)
- [IAM role for tagging a Spot Fleet](#)

Grant permission to users for Spot Fleet

If your users will create or manage a Spot Fleet, be sure to grant them the required permissions.

To create a policy for Spot Fleet

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Policies**, **Create policy**.
3. On the **Create policy** page, choose **JSON**, and replace the text with the following.

{

```
"Version": "2012-10-17",
"Statement": [
    {
        "Effect": "Allow",
        "Action": [
            "ec2:RunInstances",
            "ec2:CreateTags",
            "ec2:RequestSpotFleet",
            "ec2:ModifySpotFleetRequest",
            "ec2:CancelSpotFleetRequests",
            "ec2:DescribeSpotFleetRequests",
            "ec2:DescribeSpotFleetInstances",
            "ec2:DescribeSpotFleetRequestHistory"
        ],
        "Resource": "*"
    },
    {
        "Effect": "Allow",
        "Action": "iam:PassRole",
        "Resource": "arn:aws:iam::*:role/aws-ec2-spot-fleet-tagging-role"
    },
    {
        "Effect": "Allow",
        "Action": [
            "iam>CreateServiceLinkedRole",
            "iam>ListRoles",
            "iam>ListInstanceProfiles"
        ],
        "Resource": "*"
    }
]
}
```

The preceding example policy grants a user the permissions required for most Spot Fleet use cases. To limit the user to specific API actions, specify only those API actions instead.

Required EC2 and IAM APIs

The following APIs must be included in the policy:

- `ec2:RunInstances` – Required to launch instances in a Spot Fleet
- `ec2:CreateTags` – Required to tag the Spot Fleet request, instances, or volumes

- `iam:PassRole` – Required to specify the Spot Fleet role
- `iam>CreateServiceLinkedRole` – Required to create the service-linked role
- `iam>ListRoles` – Required to enumerate existing IAM roles
- `iam>ListInstanceProfiles` – Required to enumerate existing instance profiles

⚠️ Important

If you specify a role for the IAM instance profile in the launch specification or launch template, you must grant the user the permission to pass the role to the service. To do this, in the IAM policy include "`arn:aws:iam::*:role/IamInstanceProfile-role`" as a resource for the `iam:PassRole` action. For more information, see [Granting a user permissions to pass a role to an AWS service](#) in the *IAM User Guide*.

Spot Fleet APIs

Add the following Spot Fleet API actions to your policy, as needed:

- `ec2:RequestSpotFleet`
- `ec2:ModifySpotFleetRequest`
- `ec2:CancelSpotFleetRequests`
- `ec2:DescribeSpotFleetRequests`
- `ec2:DescribeSpotFleetInstances`
- `ec2:DescribeSpotFleetRequestHistory`

Optional IAM APIs

(Optional) To enable a user to create roles or instance profiles using the IAM console, you must add the following actions to the policy:

- `iam:AddRoleToInstanceProfile`
- `iam:AttachRolePolicy`
- `iam>CreateInstanceProfile`
- `iam>CreateRole`

- `iam:GetRole`
 - `iam>ListPolicies`
4. Choose **Review policy**.
5. On the **Review policy** page, enter a policy name and description, and choose **Create policy**.
6. To provide access, add permissions to your users, groups, or roles:
- Users and groups in AWS IAM Identity Center:

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center User Guide*.
 - Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.
 - IAM users:
 - Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.
 - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

Service-linked role for Spot Fleet

Amazon EC2 uses service-linked roles for the permissions that it requires to call other AWS services on your behalf. A service-linked role is a unique type of IAM role that is linked directly to an AWS service. Service-linked roles provide a secure way to delegate permissions to AWS services because only the linked service can assume a service-linked role. For more information, see [Using service-linked roles](#) in the *IAM User Guide*.

Amazon EC2 uses the service-linked role named **AWSServiceRoleForEC2SpotFleet** to launch and manage instances on your behalf.

Important

If you specify an [encrypted AMI](#) or an encrypted Amazon EBS snapshot in your Spot Fleet, you must grant the **AWSServiceRoleForEC2SpotFleet** role permission to use the CMK so

that Amazon EC2 can launch instances on your behalf. For more information, see [Grant access to CMKs for use with encrypted AMIs and EBS snapshots](#).

Permissions granted by **AWSServiceRoleForEC2SpotFleet**

Amazon EC2 uses **AWSServiceRoleForEC2SpotFleet** to complete the following actions:

- `ec2:RequestSpotInstances` - Request Spot Instances
- `ec2:RunInstances` - Launch instances
- `ec2:TerminateInstances` - Terminate instances
- `ec2:DescribeImages` - Describe Amazon Machine Images (AMIs) for the instances
- `ec2:DescribeInstanceStatus` - Describe the status of the instances
- `ec2:DescribeSubnets` - Describe the subnets for the instances
- `ec2>CreateTags` - Add tags to the Spot Fleet request, instances, and volumes
- `elasticloadbalancing:RegisterInstancesWithLoadBalancer` - Add the specified instances to the specified load balancer
- `elasticloadbalancing:RegisterTargets` - Register the specified targets with the specified target group

Create the service-linked role

Under most circumstances, you don't need to manually create a service-linked role. Amazon EC2 creates the **AWSServiceRoleForEC2SpotFleet** service-linked role the first time you create a Spot Fleet using the console.

If you had an active Spot Fleet request before October 2017, when Amazon EC2 began supporting this service-linked role, Amazon EC2 created the **AWSServiceRoleForEC2SpotFleet** role in your AWS account. For more information, see [A new role appeared in my AWS account](#) in the *IAM User Guide*.

If you use the AWS CLI or an API to create a Spot Fleet, you must first ensure that this role exists.

To create **AWSServiceRoleForEC2SpotFleet** using the console

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**.

3. Choose **Create role**.
4. On the **Select trusted entity** page, do the following:
 - a. For **Trusted entity type**, choose **AWS service**.
 - b. Under **Use case**, for **Service or use case**, choose **EC2**.
 - c. For **Use case**, choose **EC2 - Spot Fleet**.
 - d. Choose **Next**.
5. On the **Add permissions** page, choose **Next**.
6. On the **Name, review, and create** page, choose **Create role**.

To create **AWSServiceRoleForEC2SpotFleet** using the AWS CLI

Use the [create-service-linked-role](#) command as follows.

```
aws iam create-service-linked-role --aws-service-name spotfleet.amazonaws.com
```

If you no longer need to use Spot Fleet, we recommend that you delete the **AWSServiceRoleForEC2SpotFleet** role. After this role is deleted from your account, Amazon EC2 will create the role again if you request a Spot Fleet using the console. For more information, see [Deleting a service-linked role](#) in the *IAM User Guide*.

Grant access to CMKs for use with encrypted AMIs and EBS snapshots

If you specify an [encrypted AMI](#) or an encrypted Amazon EBS snapshot in your Spot Fleet request and you use a customer managed key for encryption, you must grant the **AWSServiceRoleForEC2SpotFleet** role permission to use the CMK so that Amazon EC2 can launch instances on your behalf. To do this, you must add a grant to the CMK, as shown in the following procedure.

When providing permissions, grants are an alternative to key policies. For more information, see [Using Grants](#) and [Using Key Policies in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

To grant the **AWSServiceRoleForEC2SpotFleet** role permissions to use the CMK

- Use the [create-grant](#) command to add a grant to the CMK and to specify the principal (the **AWSServiceRoleForEC2SpotFleet** service-linked role) that is given permission to perform the

operations that the grant permits. The CMK is specified by the key-id parameter and the ARN of the CMK. The principal is specified by the grantee-principal parameter and the ARN of the **AWSServiceRoleForEC2SpotFleet** service-linked role.

```
aws kms create-grant \
--region us-east-1 \
--key-id arn:aws:kms:us-
east-1:44445556666:key/1234abcd-12ab-34cd-56ef-1234567890ab \
--grantee-principal arn:aws:iam::111122223333:role/
AWSServiceRoleForEC2SpotFleet \
--operations "Decrypt" "Encrypt" "GenerateDataKey"
"GenerateDataKeyWithoutPlaintext" "CreateGrant" "DescribeKey" "ReEncryptFrom"
"ReEncryptTo"
```

Service-linked role for Spot Instances

Amazon EC2 uses the service-linked role named **AWSServiceRoleForEC2Spot** to launch and manage Spot Instances on your behalf. For more information, see [Service-linked role for Spot Instance requests](#).

IAM role for tagging a Spot Fleet

The `aws-ec2-spot-fleet-tagging-role` IAM role grants the Spot Fleet permission to tag the Spot Fleet request, instances, and volumes. For more information, see [Tag a Spot Fleet](#).

Important

If you choose to tag instances in the fleet and you also choose to maintain target capacity (the Spot Fleet request is of type `maintain`), the differences in the permissions that are set for the user and the `IamFleetRole` might lead to inconsistent tagging behavior of instances in the fleet. If the `IamFleetRole` does not include the `CreateTags` permission, some of the instances launched by the fleet might not be tagged. While we are working to fix this inconsistency, to ensure that all instances launched by the fleet are tagged, we recommend that you use the `aws-ec2-spot-fleet-tagging-role` role for the `IamFleetRole`. Alternatively, to use an existing role, attach the `AmazonEC2SpotFleetTaggingRole` AWS Managed Policy to the existing role. Otherwise, you need to manually add the `CreateTags` permission to your existing policy.

To create the IAM role for tagging a Spot Fleet

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**.
3. Choose **Create role**.
4. On the **Select trusted entity** page, under **Trusted entity type**, choose **AWS service**.
5. Under **Use case**, from **Use cases for other AWS services**, choose **EC2**, and then choose **EC2 - Spot Fleet Tagging**.
6. Choose **Next**.
7. On the **Add permissions** page, choose **Next**.
8. On the **Name, review, and create** page, for **Role name**, enter a name for the role (for example, **aws-ec2-spot-fleet-tagging-role**).
9. Review the information on the page, and then choose **Create role**.

Cross-service confused deputy prevention

The [confused deputy problem](#) is a security issue where an entity that doesn't have permission to perform an action can coerce a more-privileged entity to perform the action. We recommend that you use the [aws:SourceArn](#) and [aws:SourceAccount](#) global condition context keys in the aws-ec2-spot-fleet-tagging-role trust policy to limit the permissions that Spot Fleet gives another service to the resource.

To add the aws:SourceArn and aws:SourceAccount condition keys to the aws-ec2-spot-fleet-tagging-role trust policy

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**.
3. Find the aws-ec2-spot-fleet-tagging-role that you created previously and choose the link (not the check box).
4. Under **Summary**, choose the **Trust relationships** tab, and then choose **Edit trust policy**.
5. In the JSON statement, add a Condition element containing your aws:SourceAccount and aws:SourceArn global condition context keys to prevent the [confused deputy problem](#), as follows:

```
"Condition": {
```

```
"ArnLike": {  
    "aws:SourceArn": "arn:aws:ec2:us-east-1:account_id:spot-fleet-request/sfr-  
**  
},  
"StringEquals": {  
    "aws:SourceAccount": "account_id"  
}
```

Note

If the aws:SourceArn value contains the account ID and you use both global condition context keys, the aws:SourceAccount value and the account in the aws:SourceArn value must use the same account ID when used in the same policy statement.

The final trust policy will be as follows:

```
{  
    "Version": "2012-10-17",  
    "Statement": {  
        "Sid": "ConfusedDeputyPreventionExamplePolicy",  
        "Effect": "Allow",  
        "Principal": {  
            "Service": "spotfleet.amazonaws.com"  
        },  
        "Action": "sts:AssumeRole",  
        "Condition": {  
            "ArnLike": {  
                "aws:SourceArn": "arn:aws:ec2:us-east-1:account_id:spot-fleet-request/sfr-  
**  
            },  
            "StringEquals": {  
                "aws:SourceAccount": "account_id"  
            }  
        }  
    }  
}
```

6. Choose **Update policy**.

The following table provides potential values for `aws:SourceArn` to limit the scope of the your `aws-ec2-spot-fleet-tagging-role` in varying degrees of specificity.

API operation	Called service	Scope	<code>aws:SourceArn</code>
RequestSpotFleet	AWS STS (<code>AssumeRole</code>)	Limit the <code>AssumeRole</code> capability on <code>aws-ec2-spot-fleet-tagging-role</code> to spot-fleet-requests in the specified account.	<code>arn:aws:ec2:*</code> : 123456789012 :spot-fleet-request/ <code>sfr-*</code>
RequestSpotFleet	AWS STS (<code>AssumeRole</code>)	Limit the <code>AssumeRole</code> capability on <code>aws-ec2-spot-fleet-tagging-role</code> to spot-fleet-requests in the specified account and specified Region. Note that this role will not be usable in other Regions.	<code>arn:aws:ec2:c2:</code> us-east-1 : 123456789012 :spot-fleet-request/ <code>sfr-*</code>
RequestSpotFleet	AWS STS (<code>AssumeRole</code>)	Limit the <code>AssumeRole</code> capability on <code>aws-ec2-spot-fleet-tagging-role</code> to only actions affecting the fleet <code>sfr-11111111-1-1111-1111-1111-1111111111</code> . Note that this role may not be usable for other Spot Fleets.	<code>arn:aws:ec2:c2:</code> us-east-1 : 123456789012 :spot-fleet-request/ <code>sfr-11111111-1-1111-1111-1111-1111111111</code>

API operation	Called service	Scope	aws:SourceArn
		Also, this role cannot be used to launch any new Spot Fleets through requests to the Spot Fleet API.	

Create a Spot Fleet request

Using the AWS Management Console, quickly create a Spot Fleet request by choosing only your application or task need and minimum compute specs. Amazon EC2 configures a fleet that best meets your needs and follows Spot best practice. For more information, see [Quickly create a Spot Fleet request \(console\)](#). Otherwise, you can modify any of the default settings. For more information, see [Create a Spot Fleet request using defined parameters \(console\)](#) and [Create a Spot Fleet using the AWS CLI](#).

Options for creating a Spot Fleet

- [Quickly create a Spot Fleet request \(console\)](#)
- [Create a Spot Fleet request using defined parameters \(console\)](#)
- [Create a Spot Fleet using the AWS CLI](#)

Quickly create a Spot Fleet request (console)

Follow these steps to quickly create a Spot Fleet request.

To create a Spot Fleet request using the recommended settings (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. If you are new to Spot, you see a welcome page; choose **Get started**. Otherwise, choose **Request Spot Instances**.
4. Under **Launch parameters**, choose **Manually configure launch parameters**.
5. For **AMI**, choose an AMI.
6. Under **Target capacity**, for **Total target capacity**, specify the number of units to request. For the type of unit, you can choose **Instances**, **vCPUs**, or **Memory (MiB)**.

7. For **Your fleet request at a glance**, review your fleet configuration, and choose **Launch**.

Create a Spot Fleet request using defined parameters (console)

You can create a Spot Fleet by using parameters that you define.

To create a Spot Fleet request using defined parameters (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. If you are new to Spot, you see a welcome page; choose **Get started**. Otherwise, choose **Request Spot Instances**.
4. For **Launch parameters**, do the following:
 - a. To define the launch parameters in the Spot console, choose **Manually configure launch parameters**.
 - b. For **AMI**, choose one of the basic AMIs provided by AWS, or choose **Search for AMI** to use an AMI from our user community, the AWS Marketplace, or one of your own.

 **Note**

If an AMI specified in the launch parameters is deregistered or disabled, no new instances can be launched from the AMI. For fleets that are set to maintain target capacity, the target capacity will not be maintained.

- c. (Optional) For **Key pair name**, choose an existing key pair or create a new one.

[Existing key pair] Choose the key pair.

[New key pair] Choose **Create new key pair** to go the **Key Pairs** page. When you are done, return to the **Spot Requests** page and refresh the list.

- d. (Optional) Expand **Additional launch parameters**, and do the following:
 - i. (Optional) To enable Amazon EBS optimization, for **EBS-optimized**, select **Launch EBS-optimized instances**.
 - ii. (Optional) To add temporary block-level storage for your instances, for **Instance store**, choose **Attach at launch**.

- iii. (Optional) To add storage, choose **Add new volume**, and specify additional instance store volumes or Amazon EBS volumes, depending on the instance type.
- iv. (Optional) By default, basic monitoring is enabled for your instances. To enable detailed monitoring, for **Monitoring**, select **Enable CloudWatch detailed monitoring**.
- v. (Optional) To run a Dedicated Spot Instance, for **Tenancy**, choose **Dedicated - run a dedicated instance**.
- vi. (Optional) For **Security groups**, choose one or more security groups or create a new one.

[Existing security group] Choose one or more security groups.

[New security group] Choose **Create new security group** to go the **Security Groups** page. When you are done, return to the **Spot Requests** and refresh the list.

- vii. (Optional) To make your instances reachable from the internet, for **Auto-assign IPv4 Public IP**, choose **Enable**.
- viii. (Optional) To launch your Spot Instances with an IAM role, for **IAM instance profile**, choose the role.
- ix. (Optional) To run a start-up script, copy it to **User data**.
- x. (Optional) To add a tag, choose **Create tag** and enter the key and value for the tag, and choose **Create**. Repeat for each tag.

For each tag, to tag the instances and the Spot Fleet request with the same tag, ensure that both **Instances** and **Fleet** are selected. To tag only the instances launched by the fleet, clear **Fleet**. To tag only the Spot Fleet request, clear **Instances**.

5. For Additional request details, do the following:

- a. Review the additional request details. To make changes, clear **Apply defaults**.
- b. (Optional) For **IAM fleet role**, you can use the default role or choose a different role. To use the default role after changing the role, choose **Use default role**.
- c. (Optional) For **Maximum price**, you can use the default maximum price (the On-Demand price) or specify the maximum price you are willing to pay. If your maximum price is lower than the Spot price for the instance types that you selected, your Spot Instances are not launched.
- d. (Optional) To create a request that is valid only during a specific time period, edit **Request valid from** and **Request valid until**.

- e. (Optional) By default, we terminate your Spot Instances when the Spot Fleet request expires. To keep them running after your request expires, clear **Terminate the instances when the request expires**.
 - f. (Optional) To register your Spot Instances with a load balancer, choose **Receive traffic from one or more load balancers** and choose one or more Classic Load Balancers or target groups.
6. For **Minimum compute unit**, choose the minimum hardware specifications (vCPUs, memory, and storage) that you need for your application or task, either **as specs** or **as an instance type**.
 - For **as specs**, specify the required number of vCPUs and amount of memory.
 - For **as an instance type**, accept the default instance type, or choose **Change instance type** to choose a different instance type.
 7. For **Target capacity**, do the following:
 - a. For **Total target capacity**, specify the number of units to request. For the type of unit, you can choose **Instances**, **vCPUs**, or **Memory (MiB)**. To specify a target capacity of 0 so that you can add capacity later, choose **Maintain target capacity**.
 - b. (Optional) For **Include On-Demand base capacity**, specify the number of On-Demand units to request. The number must be less than the **Total target capacity**. Amazon EC2 calculates the difference, and allocates the difference to Spot units to request.

 **Important**

To specify optional On-Demand capacity, you must first choose a launch template.

- c. (Optional) By default, Amazon EC2 terminates Spot Instances when they are interrupted. To maintain the target capacity, select **Maintain target capacity**. You can then specify that Amazon EC2 terminates, stops, or hibernates Spot Instances when they are interrupted. To do so, choose the corresponding option from **Interruption behavior**.

 **Note**

If an AMI specified in the launch parameters is deregistered or disabled, no new instances can be launched from the AMI. For fleets that are set to maintain target capacity, the target capacity will not be maintained.

- d. (Optional) To allow Spot Fleet to launch a replacement Spot Instance when an instance rebalance notification is emitted for an existing Spot Instance in the fleet, select **Capacity rebalance**, and then choose an instance replacement strategy. If you choose **Launch before terminate**, specify the delay (in seconds) before Spot Fleet terminates the old instances. For more information, see [Capacity Rebalancing](#).
- e. (Optional) To control the amount you pay per hour for all the Spot Instances in your fleet, select **Set maximum cost for Spot Instances** and then enter the maximum total amount you're willing to pay per hour. When the maximum total amount is reached, Spot Fleet stops launching Spot Instances even if it hasn't met the target capacity. For more information, see [Control spending](#).

8. For **Network**, do the following:

- a. For **Network**, choose an existing VPC or create a new one.

[Existing VPC] Choose the VPC.

[New VPC] Choose **Create new VPC** to go the Amazon VPC console. When you are done, return to the wizard and refresh the list.

- b. (Optional) For **Availability Zone**, let AWS choose the Availability Zones for your Spot Instances, or specify one or more Availability Zones.

If you have more than one subnet in an Availability Zone, choose the appropriate subnet from **Subnet**. To add subnets, choose **Create new subnet** to go to the Amazon VPC console. When you are done, return to the wizard and refresh the list.

9. For **Instance type requirements**, you can either specify instance attributes and let Amazon EC2 identify the optimal instance types with these attributes, or you can specify a list of instances. For more information, see [Attribute-based instance type selection for Spot Fleet](#).

- a. If you choose **Specify instance attributes that match your compute requirements**, specify your instance attributes as follows:
 - i. For **vCPUs**, enter the desired minimum and maximum number of vCPUs. To specify no limit, select **No minimum**, **No maximum**, or both.
 - ii. For **Memory (GiB)**, enter the desired minimum and maximum amount of memory. To specify no limit, select **No minimum**, **No maximum**, or both.
 - iii. (Optional) For **Additional instance attributes**, you can optionally specify one or more attributes to express your compute requirements in more detail. Each additional

attribute adds a further constraint to your request. You can omit the additional attributes; when omitted, the default values are used. For a description of each attribute and their default values, see [get-spot-placement-scores](#) in the *Amazon EC2 Command Line Reference*.

- iv. (Optional) To view the instance types with your specified attributes, expand **Preview matching instance types**. To exclude instance types from being used in your request, select the instances and then choose **Exclude selected instance types**.
 - b. If you choose **Manually select instance types**, Spot Fleet provides a default list of instance types. To select more instance types, choose **Add instance types**, select the instance types to use in your request, and choose **Select**. To delete instance types, select the instance types and choose **Delete**.
10. For **Allocation strategy**, choose the strategy that meets your needs. For more information, see [Allocation strategies for Spot Instances](#).
 11. For **Your fleet request at a glance**, review your fleet configuration, and make any adjustments if necessary.
 12. (Optional) To download a copy of the launch configuration for use with the AWS CLI, choose **JSON config**.
 13. Choose **Launch**.

The Spot Fleet request type is `fleet`. When the request is fulfilled, requests of type `instance` are added, where the state is `active` and the status is `fulfilled`.

Create a Spot Fleet using the AWS CLI

To create a Spot Fleet request using the AWS CLI

- Use the [`request-spot-fleet`](#) command to create a Spot Fleet request.

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

For example configuration files, see [Spot Fleet example configurations](#).

The following is example output:

```
{  
  "SpotFleetRequestId": "sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE"
```

{}

Tag a Spot Fleet

To help categorize and manage your Spot Fleet requests, you can tag them with custom metadata. You can assign a tag to a Spot Fleet request when you create it, or afterward. You can assign tags using the Amazon EC2 console or a command line tool.

When you tag a Spot Fleet request, the instances and volumes that are launched by the Spot Fleet are not automatically tagged. You need to explicitly tag the instances and volumes launched by the Spot Fleet. You can choose to assign tags to only the Spot Fleet request, or to only the instances launched by the fleet, or to only the volumes attached to the instances launched by the fleet, or to all three.

 **Note**

Volume tags are only supported for volumes that are attached to On-Demand Instances. You can't tag volumes that are attached to Spot Instances.

For more information about how tags work, see [Tag your Amazon EC2 resources](#).

Contents

- [Prerequisite](#)
- [Tag a new Spot Fleet](#)
- [Tag a new Spot Fleet and the instances and volumes that it launches](#)
- [Tag an existing Spot Fleet](#)
- [View Spot Fleet request tags](#)

Prerequisite

Grant the user the permission to tag resources. For more information, see [Example: Tag resources](#).

To grant a user the permission to tag resources

Create an IAM policy that includes the following:

- The `ec2:CreateTags` action. This grants the user permission to create tags.

- The `ec2:RequestSpotFleet` action. This grants the user permission to create a Spot Fleet request.
- For Resource, you must specify `"*"`. This allows users to tag all resource types.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "TagSpotFleetRequest",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags",  
                "ec2:RequestSpotFleet"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

A Important

We currently do not support resource-level permissions for the `spot-fleet-request` resource. If you specify `spot-fleet-request` as a resource, you will get an unauthorized exception when you try to tag the fleet. The following example illustrates how *not* to set the policy.

```
{  
    "Effect": "Allow",  
    "Action": [  
        "ec2:CreateTags",  
        "ec2:RequestSpotFleet"  
    ],  
    "Resource": "arn:aws:ec2:us-east-1:111122223333:spot-fleet-request/*"  
}
```

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center User Guide*.

- Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.

- IAM users:

- Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.
- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

Tag a new Spot Fleet

To tag a new Spot Fleet request using the console

1. Follow the [Create a Spot Fleet request using defined parameters \(console\)](#) procedure.
2. To add a tag, expand **Additional configurations**, choose **Add new tag**, and enter the key and value for the tag. Repeat for each tag.

For each tag, you can tag the Spot Fleet request and the instances with the same tag. To tag both, ensure that both **Instance tags** and **Fleet tags** are selected. To tag only the Spot Fleet request, clear **Instance tags**. To tag only the instances launched by the fleet, clear **Fleet tags**.

3. Complete the required fields to create a Spot Fleet request, and then choose **Launch**. For more information, see [Create a Spot Fleet request using defined parameters \(console\)](#).

To tag a new Spot Fleet request using the AWS CLI

To tag a Spot Fleet request when you create it, configure the Spot Fleet request configuration as follows:

- Specify the tags for the Spot Fleet request in `SpotFleetRequestConfig`.
- For `ResourceType`, specify `spot-fleet-request`. If you specify another value, the fleet request will fail.
- For `Tags`, specify the key-value pair. You can specify more than one key-value pair.

In the following example, the Spot Fleet request is tagged with two tags: Key=Environment and Value=Production, and Key=Cost-Center and Value=123.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchSpecifications": [  
            {  
                "ImageId": "ami-0123456789EXAMPLE",  
                "InstanceType": "c4.large"  
            }  
        ],  
        "SpotPrice": "5",  
        "TargetCapacity": 2,  
        "TerminateInstancesWithExpiration": true,  
        "Type": "maintain",  
        "ReplaceUnhealthyInstances": true,  
        "InstanceInterruptionBehavior": "terminate",  
        "InstancePoolsToUseCount": 1,  
        "TagSpecifications": [  
            {  
                "ResourceType": "spot-fleet-request",  
                "Tags": [  
                    {  
                        "Key": "Environment",  
                        "Value": "Production"  
                    },  
                    {  
                        "Key": "Cost-Center",  
                        "Value": "123"  
                    }  
                ]  
            }  
        ]  
    }  
}
```

Tag a new Spot Fleet and the instances and volumes that it launches

To tag a new Spot Fleet request and the instances and volumes that it launches using the AWS CLI

To tag a Spot Fleet request when you create it, and to tag the instances and volumes when they are launched by the fleet, configure the Spot Fleet request configuration as follows:

Spot Fleet request tags:

- Specify the tags for the Spot Fleet request in `SpotFleetRequestConfig`.
- For `ResourceType`, specify `spot-fleet-request`. If you specify another value, the fleet request will fail.
- For `Tags`, specify the key-value pair. You can specify more than one key-value pair.

Instance tags:

- Specify the tags for the instances in `LaunchSpecifications`.
- For `ResourceType`, specify `instance`. If you specify another value, the fleet request will fail.
- For `Tags`, specify the key-value pair. You can specify more than one key-value pair.

Alternatively, you can specify the tags for the instance in the [launch template](#) that is referenced in the Spot Fleet request.

Volume tags:

- Specify the tags for the volumes in the [launch template](#) that is referenced in the Spot Fleet request. Volume tagging in `LaunchSpecifications` is not supported.

In the following example, the Spot Fleet request is tagged with two tags: `Key=Environment` and `Value=Production`, and `Key=Cost-Center` and `Value=123`. The instances that are launched by the fleet are tagged with one tag (which is the same as one of the tags for the Spot Fleet request): `Key=Cost-Center` and `Value=123`.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "Tags": [  
            {"Key": "Environment", "Value": "Production"},  
            {"Key": "Cost-Center", "Value": "123"}  
        ]  
    }  
}
```

```
"IamFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",
"LaunchSpecifications": [
    {
        "ImageId": "ami-0123456789EXAMPLE",
        "InstanceType": "c4.large",
        "TagSpecifications": [
            {
                "ResourceType": "instance",
                "Tags": [
                    {
                        "Key": "Cost-Center",
                        "Value": "123"
                    }
                ]
            }
        ]
    },
    "SpotPrice": "5",
    "TargetCapacity": 2,
    "TerminateInstancesWithExpiration": true,
    "Type": "maintain",
    "ReplaceUnhealthyInstances": true,
    "InstanceInterruptionBehavior": "terminate",
    "InstancePoolsToUseCount": 1,
    "TagSpecifications": [
        {
            "ResourceType": "spot-fleet-request",
            "Tags": [
                {
                    "Key": "Environment",
                    "Value": "Production"
                },
                {
                    "Key": "Cost-Center",
                    "Value": "123"
                }
            ]
        }
    ]
}
```

To tag instances launched by a Spot Fleet using the AWS CLI

To tag instances when they are launched by the fleet, you can either specify the tags in the [launch template](#) that is referenced in the Spot Fleet request, or you can specify the tags in the Spot Fleet request configuration as follows:

- Specify the tags for the instances in LaunchSpecifications.
- For ResourceType, specify instance. If you specify another value, the fleet request will fail.
- For Tags, specify the key-value pair. You can specify more than one key-value pair.

In the following example, the instances that are launched by the fleet are tagged with one tag: Key=Cost-Center and Value=123.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchSpecifications": [  
            {  
                "ImageId": "ami-0123456789EXAMPLE",  
                "InstanceType": "c4.large",  
                "TagSpecifications": [  
                    {  
                        "ResourceType": "instance",  
                        "Tags": [  
                            {  
                                "Key": "Cost-Center",  
                                "Value": "123"  
                            }  
                        ]  
                    }  
                ]  
            }  
        ],  
        "SpotPrice": "5",  
        "TargetCapacity": 2,  
        "TerminateInstancesWithExpiration": true,  
        "Type": "maintain",  
        "ReplaceUnhealthyInstances": true,  
    }  
}
```

```
    "InstanceInterruptionBehavior": "terminate",
    "InstancePoolsToUseCount": 1
}
}
```

To tag volumes attached to On-Demand Instances launched by a Spot Fleet using the AWS CLI

To tag volumes when they are created by the fleet, you must specify the tags in the [launch template](#) that is referenced in the Spot Fleet request.

Note

Volume tags are only supported for volumes that are attached to On-Demand Instances.

You can't tag volumes that are attached to Spot Instances.

Volume tagging in LaunchSpecifications is not supported.

Tag an existing Spot Fleet

To tag an existing Spot Fleet request using the console

After you have created a Spot Fleet request, you can add tags to the fleet request using the console.

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose the **Tags** tab and choose **Create Tag**.

To tag an existing Spot Fleet request using the AWS CLI

You can use the [create-tags](#) command to tag existing resources. In the following example, the existing Spot Fleet request is tagged with Key=purpose and Value=test.

```
aws ec2 create-tags \
--resources sfr-11112222-3333-4444-5555-66666EXAMPLE \
--tags Key=purpose,Value=test
```

View Spot Fleet request tags

To view Spot Fleet request tags using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Tags** tab.

To describe Spot Fleet request tags

Use the [describe-tags](#) command to view the tags for the specified resource. In the following example, you describe the tags for the specified Spot Fleet request.

```
aws ec2 describe-tags \
  --filters "Name=resource-id,Values=sfr-11112222-3333-4444-5555-66666EXAMPLE"
```

```
{
  "Tags": [
    {
      "Key": "Environment",
      "ResourceId": "sfr-11112222-3333-4444-5555-66666EXAMPLE",
      "ResourceType": "spot-fleet-request",
      "Value": "Production"
    },
    {
      "Key": "Another key",
      "ResourceId": "sfr-11112222-3333-4444-5555-66666EXAMPLE",
      "ResourceType": "spot-fleet-request",
      "Value": "Another value"
    }
  ]
}
```

You can also view the tags of a Spot Fleet request by describing the Spot Fleet request.

Use the [describe-spot-fleet-requests](#) command to view the configuration of the specified Spot Fleet request, which includes any tags that were specified for the fleet request.

```
aws ec2 describe-spot-fleet-requests \
  --spot-fleet-request-ids sfr-11112222-3333-4444-5555-66666EXAMPLE
```

```
{  
    "SpotFleetRequestConfigs": [  
        {  
            "ActivityStatus": "fulfilled",  
            "CreateTime": "2020-02-13T02:49:19.709Z",  
            "SpotFleetRequestConfig": {  
                "AllocationStrategy": "capacityOptimized",  
                "OnDemandAllocationStrategy": "lowestPrice",  
                "ExcessCapacityTerminationPolicy": "Default",  
                "FulfilledCapacity": 2.0,  
                "OnDemandFulfilledCapacity": 0.0,  
                "IamFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-  
tagging-role",  
                "LaunchSpecifications": [  
                    {  
                        "ImageId": "ami-0123456789EXAMPLE",  
                        "InstanceType": "c4.large"  
                    }  
                ],  
                "TargetCapacity": 2,  
                "OnDemandTargetCapacity": 0,  
                "Type": "maintain",  
                "ReplaceUnhealthyInstances": false,  
                "InstanceInterruptionBehavior": "terminate"  
            },  
            "SpotFleetRequestId": "sfr-11112222-3333-4444-5555-66666EXAMPLE",  
            "SpotFleetRequestState": "active",  
            "Tags": [  
                {  
                    "Key": "Environment",  
                    "Value": "Production"  
                },  
                {  
                    "Key": "Another key",  
                    "Value": "Another value"  
                }  
            ]  
        }  
    ]  
}
```

Describe your Spot Fleet

The Spot Fleet launches Spot Instances when your maximum price exceeds the Spot price and capacity is available. The Spot Instances run until they are interrupted or you terminate them.

To describe your Spot Fleet (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request. To see the configuration details, choose **Description**.
4. To list the Spot Instances for the Spot Fleet, choose **Instances**.
5. To view the history for the Spot Fleet, choose **History**.

To describe your Spot Fleet (AWS CLI)

Use the [describe-spot-fleet-requests](#) command to describe your Spot Fleet requests.

```
aws ec2 describe-spot-fleet-requests
```

Use the [describe-spot-fleet-instances](#) command to describe the Spot Instances for the specified Spot Fleet.

```
aws ec2 describe-spot-fleet-instances \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE
```

Use the [describe-spot-fleet-request-history](#) command to describe the history for the specified Spot Fleet request.

```
aws ec2 describe-spot-fleet-request-history \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--start-time 2015-05-18T00:00:00Z
```

Modify a Spot Fleet request

You can modify an active Spot Fleet request to complete the following tasks:

- Increase the target capacity and On-Demand portion
- Decrease the target capacity and On-Demand portion

Note

You can't modify a one-time Spot Fleet request. You can only modify a Spot Fleet request if you selected **Maintain target capacity** when you created the Spot Fleet request.

When you increase the target capacity, the Spot Fleet launches additional Spot Instances. When you increase the On-Demand portion, the Spot Fleet launches additional On-Demand Instances.

When you increase the target capacity, the Spot Fleet launches the additional Spot Instances according to the allocation strategy for its Spot Fleet request. If the allocation strategy is `lowestPrice`, the Spot Fleet launches the instances from the lowest priced Spot capacity pool in the Spot Fleet request. If the allocation strategy is `diversified`, the Spot Fleet distributes the instances across the pools in the Spot Fleet request.

When you decrease the target capacity, the Spot Fleet cancels any open requests that exceed the new target capacity. You can request that the Spot Fleet terminate Spot Instances until the size of the fleet reaches the new target capacity. If the allocation strategy is `lowestPrice`, the Spot Fleet terminates the instances with the highest price per unit. If the allocation strategy is `diversified`, the Spot Fleet terminates instances across the pools. Alternatively, you can request that the Spot Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or that you terminate manually.

When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

To modify a Spot Fleet request (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose **Actions, Modify target capacity**.
5. In **Modify target capacity**, do the following:
 - a. Enter the new target capacity and On-Demand portion.
 - b. (Optional) If you are decreasing the target capacity but want to keep the fleet at its current size, clear **Terminate instances**.
 - c. Choose **Submit**.

To modify a Spot Fleet request using the AWS CLI

Use the [modify-spot-fleet-request](#) command to update the target capacity of the specified Spot Fleet request.

```
aws ec2 modify-spot-fleet-request \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity 20
```

You can modify the previous command as follows to decrease the target capacity of the specified Spot Fleet without terminating any Spot Instances as a result.

```
aws ec2 modify-spot-fleet-request \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity 10 \
--excess-capacity-termination-policy NoTermination
```

Cancel a Spot Fleet request

If you no longer require a Spot Fleet, you can cancel the Spot Fleet request. After you cancel a fleet request, all Spot requests associated with the fleet are also canceled, so that no new Spot Instances are launched.

When you cancel a Spot Fleet request, you must also specify if you want to terminate all of its instances. These include both On-Demand Instances and Spot Instances.

If you specify that the instances must be terminated when the fleet request is canceled, the fleet request enters the `cancelled_terminating` state. Otherwise, the fleet request enters the `cancelled_running` state and the instances continue to run until they are interrupted or you terminate them manually.

Restrictions

- You can delete up to 100 fleets in a single request. If you exceed the specified number, no fleets are deleted.

To cancel a Spot Fleet request (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.

3. Select your Spot Fleet request.
4. Choose **Actions, Cancel request**.
5. In the **Cancel Spot request** dialog box, do the following:
 - a. To terminate the associated instances at the same time as canceling the Spot Fleet request, leave the **Terminate instances** check box selected. To cancel the Spot Fleet request without terminating the associated instances, clear the **Terminate instances** check box.
 - b. Choose **Confirm**.

To cancel a Spot Fleet request and terminate its instances using the AWS CLI

Use the [cancel-spot-fleet-requests](#) command to cancel the specified Spot Fleet request and terminate its On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
    --terminate-instances
```

Example output

```
{
  "SuccessfulFleetRequests": [
    {
      "SpotFleetRequestId": "sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE",
      "CurrentSpotFleetRequestState": "cancelled_terminating",
      "PreviousSpotFleetRequestState": "active"
    }
  ],
  "UnsuccessfulFleetRequests": []
}
```

To cancel a Spot Fleet request without terminating its instances using the AWS CLI

You can modify the previous command using the `--no-terminate-instances` parameter to cancel the specified Spot Fleet request without terminating its On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
```

```
--no-terminate-instances
```

Example output

```
{  
    "SuccessfulFleetRequests": [  
        {  
            "SpotFleetRequestId": "sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE",  
            "CurrentSpotFleetRequestState": "cancelled_running",  
            "PreviousSpotFleetRequestState": "active"  
        }  
    ],  
    "UnsuccessfulFleetRequests": []  
}
```

CloudWatch metrics for Spot Fleet

Amazon EC2 provides Amazon CloudWatch metrics that you can use to monitor your Spot Fleet.

Important

To ensure accuracy, we recommend that you enable detailed monitoring when using these metrics. For more information, see [Enable or turn off detailed monitoring for your instances](#).

For more information about CloudWatch metrics provided by Amazon EC2, see [Monitor your instances using CloudWatch](#).

Spot Fleet metrics

The AWS/EC2Spot namespace includes the following metrics, plus the CloudWatch metrics for the Spot Instances in your fleet. For more information, see [Instance metrics](#).

Metric	Description
AvailableInstancePoolsCount	The Spot capacity pools specified in the Spot Fleet request. Units: Count

Metric	Description
BidsSubmittedForCapacity	<p>The capacity for which Amazon EC2 has submitted Spot Fleet requests.</p> <p>Units: Count</p>
EligibleInstancePoolCount	<p>The Spot capacity pools specified in the Spot Fleet request where Amazon EC2 can fulfill requests. Amazon EC2 does not fulfill requests in pools where the maximum price you're willing to pay for Spot Instances is less than the Spot price or the Spot price is greater than the price for On-Demand Instances.</p> <p>Units: Count</p>
FulfilledCapacity	<p>The capacity that Amazon EC2 has fulfilled.</p> <p>Units: Count</p>
MaxPercentCapacityAllocation	<p>The maximum value of PercentCapacityAllocation across all Spot Fleet pools specified in the Spot Fleet request.</p> <p>Units: Percent</p>
PendingCapacity	<p>The difference between TargetCapacity and FulfilledCapacity .</p> <p>Units: Count</p>

Metric	Description
PercentCapacityAllocation	The capacity allocated for the Spot capacity pool for the specified dimensions. To get the maximum value recorded across all Spot capacity pools, use MaxPercentCapacityAllocation . Units: Percent
TargetCapacity	The target capacity of the Spot Fleet request. Units: Count
TerminatingCapacity	The capacity that is being terminated because the provisioned capacity is greater than the target capacity. Units: Count

If the unit of measure for a metric is Count, the most useful statistic is Average.

Spot Fleet dimensions

To filter the data for your Spot Fleet, use the following dimensions.

Dimensions	Description
AvailabilityZone	Filter the data by Availability Zone.
FleetRequestId	Filter the data by Spot Fleet request.
InstanceType	Filter the data by instance type.

View the CloudWatch metrics for your Spot Fleet

You can view the CloudWatch metrics for your Spot Fleet using the Amazon CloudWatch console. These metrics are displayed as monitoring graphs. These graphs show data points if the Spot Fleet is active.

Metrics are grouped first by namespace, and then by the various combinations of dimensions within each namespace. For example, you can view all Spot Fleet metrics or Spot Fleet metrics groups by Spot Fleet request ID, instance type, or Availability Zone.

To view Spot Fleet metrics

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2 Spot** namespace.

 **Note**

If the **EC2 Spot** namespace is not displayed, there are two reasons for this. Either you've not yet used Spot Fleet—only the AWS services that you're using send metrics to Amazon CloudWatch. Or, if you've not used Spot Fleet for the past two weeks, the namespace does not appear.

4. (Optional) To filter the metrics by dimension, select one of the following:
 - **Fleet Request Metrics** – Group by Spot Fleet request
 - **By Availability Zone** – Group by Spot Fleet request and Availability Zone
 - **By Instance Type** – Group by Spot Fleet request and instance type
 - **By Availability Zone/Instance Type** – Group by Spot Fleet request, Availability Zone, and instance type
5. To view the data for a metric, select the check box next to the metric.

Showing all results (18) for *EC2 Spot > Fleet Request Metrics*. For more results expand your search to [All EC2 Spot Metrics](#).

Select All | Clear

EC2 Spot > Fleet Request Metrics

FleetRequestId	Metric Name
sfr-4a707781-8fac-459b-a5ae-4701fcee47d7	AvailableInstancePoolsCount
sfr-4a707781-8fac-459b-a5ae-4701fcee47d7	BidsSubmittedForCapacity
<input checked="" type="checkbox"/> sfr-4a707781-8fac-459b-a5ae-4701fcee47d7	CPUUtilization
sfr-4a707781-8fac-459b-a5ae-4701fcee47d7	DiskReadBytes

Automatic scaling for Spot Fleet

Automatic scaling is the ability to increase or decrease the target capacity of your Spot Fleet automatically based on demand. A Spot Fleet can either launch instances (scale out) or terminate instances (scale in), within the range that you choose, in response to one or more scaling policies.

Spot Fleet supports the following types of automatic scaling:

- **Target tracking scaling** – Increase or decrease the current capacity of the fleet based on a target value for a specific metric. This is similar to the way that your thermostat maintains the temperature of your home—you select temperature and the thermostat does the rest.
- **Step scaling** – Increase or decrease the current capacity of the fleet based on a set of scaling adjustments, known as step adjustments, that vary based on the size of the alarm breach.
- **Scheduled scaling** – Increase or decrease the current capacity of the fleet based on the date and time.

If you are using [instance weighting](#), keep in mind that Spot Fleet can exceed the target capacity as needed. Fulfilled capacity can be a floating-point number but target capacity must be an integer, so Spot Fleet rounds up to the next integer. You must take these behaviors into account when you look at the outcome of a scaling policy when an alarm is triggered. For example, suppose that the target capacity is 30, the fulfilled capacity is 30.1, and the scaling policy subtracts 1. When the alarm is triggered, the automatic scaling process subtracts 1 from 30.1 to get 29.1 and then rounds it up to 30, so no scaling action is taken. As another example, suppose that you selected instance weights of 2, 4, and 8, and a target capacity of 10, but no weight 2 instances were available so

Spot Fleet provisioned instances of weights 4 and 8 for a fulfilled capacity of 12. If the scaling policy decreases target capacity by 20% and an alarm is triggered, the automatic scaling process subtracts 12×0.2 from 12 to get 9.6 and then rounds it up to 10, so no scaling action is taken.

The scaling policies that you create for Spot Fleet support a cooldown period. This is the number of seconds after a scaling activity completes where previous trigger-related scaling activities can influence future scaling events. For scale-out policies, while the cooldown period is in effect, the capacity that has been added by the previous scale-out event that initiated the cooldown is calculated as part of the desired capacity for the next scale out. The intention is to continuously (but not excessively) scale out. For scale in policies, the cooldown period is used to block subsequent scale in requests until it has expired. The intention is to scale in conservatively to protect your application's availability. However, if another alarm triggers a scale-out policy during the cooldown period after a scale-in, automatic scaling scales out your scalable target immediately.

We recommend that you scale based on instance metrics with a 1-minute frequency because that ensures a faster response to utilization changes. Scaling on metrics with a 5-minute frequency can result in slower response time and scaling on stale metric data. To send metric data for your instances to CloudWatch in 1-minute periods, you must specifically enable detailed monitoring. For more information, see [Enable or turn off detailed monitoring for your instances](#) and [Create a Spot Fleet request using defined parameters \(console\)](#).

For more information about configuring scaling for Spot Fleet, see the following resources:

- [application-autoscaling](#) section of the *AWS CLI Command Reference*
- [Application Auto Scaling API Reference](#)
- [Application Auto Scaling User Guide](#)

IAM permissions required for Spot Fleet automatic scaling

Automatic scaling for Spot Fleet is made possible by a combination of the Amazon EC2, Amazon CloudWatch, and Application Auto Scaling APIs. Spot Fleet requests are created with Amazon EC2, alarms are created with CloudWatch, and scaling policies are created with Application Auto Scaling.

In addition to the [IAM permissions for Spot Fleet](#) and Amazon EC2, the user that accesses fleet scaling settings must have the appropriate permissions for the services that support dynamic scaling. Users must have permissions to use the actions shown in the following example policy.

{

```
"Version": "2012-10-17",
"Statement": [
    {
        "Effect": "Allow",
        "Action": [
            "application-autoscaling:*",
            "ec2:DescribeSpotFleetRequests",
            "ec2:ModifySpotFleetRequest",
            "cloudwatch:DeleteAlarms",
            "cloudwatch:DescribeAlarmHistory",
            "cloudwatch:DescribeAlarms",
            "cloudwatch:DescribeAlarmsForMetric",
            "cloudwatch:GetMetricStatistics",
            "cloudwatch>ListMetrics",
            "cloudwatch:PutMetricAlarm",
            "cloudwatch:DisableAlarmActions",
            "cloudwatch:EnableAlarmActions",
            "iam>CreateServiceLinkedRole",
            "sns>CreateTopic",
            "sns:Subscribe",
            "sns:Get*",
            "sns>List*"
        ],
        "Resource": "*"
    }
]
```

You can also create your own IAM policies that allow more fine-grained permissions for calls to the Application Auto Scaling API. For more information, see [Authentication and Access Control](#) in the *Application Auto Scaling User Guide*.

The Application Auto Scaling service also needs permission to describe your Spot Fleet and CloudWatch alarms, and permissions to modify your Spot Fleet target capacity on your behalf. If you enable automatic scaling for your Spot Fleet, it creates a service-linked role named `AWSServiceRoleForApplicationAutoScaling_EC2SpotFleetRequest`. This service-linked role grants Application Auto Scaling permission to describe the alarms for your policies, to monitor the current capacity of the fleet, and to modify the capacity of the fleet. The original managed Spot Fleet role for Application Auto Scaling was `aws-ec2-spot-fleet-autoscale-role`, but it is no longer required. The service-linked role is the default role for Application Auto Scaling. For more information, see [Service-Linked Roles](#) in the *Application Auto Scaling User Guide*.

Scale Spot Fleet using a target tracking policy

With target tracking scaling policies, you select a metric and set a target value. Spot Fleet creates and manages the CloudWatch alarms that trigger the scaling policy and calculates the scaling adjustment based on the metric and the target value. The scaling policy adds or removes capacity as required to keep the metric at, or close to, the specified target value. In addition to keeping the metric close to the target value, a target tracking scaling policy also adjusts to the fluctuations in the metric due to a fluctuating load pattern and minimizes rapid fluctuations in the capacity of the fleet.

You can create multiple target tracking scaling policies for a Spot Fleet, provided that each of them uses a different metric. The fleet scales based on the policy that provides the largest fleet capacity. This enables you to cover multiple scenarios and ensure that there is always enough capacity to process your application workloads.

To ensure application availability, the fleet scales out proportionally to the metric as fast as it can, but scales in more gradually.

When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

Do not edit or delete the CloudWatch alarms that Spot Fleet manages for a target tracking scaling policy. Spot Fleet deletes the alarms automatically when you delete the target tracking scaling policy.

Limitation

The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`.

To configure a target tracking policy (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose **Auto Scaling**.
4. If automatic scaling is not configured, choose **Configure**.
5. Use **Scale capacity between** to set the minimum and maximum capacity for your fleet.
Automatic scaling does not scale your fleet below the minimum capacity or above the maximum capacity.

6. For **Policy name**, enter a name for the policy.
7. Choose a **Target metric**.
8. Enter a **Target value** for the metric.
9. For **Cooldown period**, specify a new value (in seconds) or keep the default.
10. (Optional) Select **Disable scale-in** to omit creating a scale-in policy based on the current configuration. You can create a scale-in policy using a different configuration.
11. Choose **Save**.

To configure a target tracking policy using the AWS CLI

1. Register the Spot Fleet request as a scalable target using the [register-scalable-target](#) command.
2. Create a scaling policy using the [put-scaling-policy](#) command.

Scale Spot Fleet using step scaling policies

With step scaling policies, you specify CloudWatch alarms to trigger the scaling process. For example, if you want to scale out when CPU utilization reaches a certain level, create an alarm using the `CPUUtilization` metric provided by Amazon EC2.

When you create a step scaling policy, you must specify one of the following scaling adjustment types:

- **Add** – Increase the target capacity of the fleet by a specified number of capacity units or a specified percentage of the current capacity.
- **Remove** – Decrease the target capacity of the fleet by a specified number of capacity units or a specified percentage of the current capacity.
- **Set to** – Set the target capacity of the fleet to the specified number of capacity units.

When an alarm is triggered, the automatic scaling process calculates the new target capacity using the fulfilled capacity and the scaling policy, and then updates the target capacity accordingly. For example, suppose that the target capacity and fulfilled capacity are 10 and the scaling policy adds 1. When the alarm is triggered, the automatic scaling process adds 1 to 10 to get 11, so Spot Fleet launches 1 instance.

When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

Limitation

The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`, or `Spot blocks`.

Prerequisites

- Consider which CloudWatch metrics are important to your application. You can create CloudWatch alarms based on metrics provided by AWS or your own custom metrics.
- For the AWS metrics that you will use in your scaling policies, enable CloudWatch metrics collection if the service that provides the metrics does not enable it by default.

To create a CloudWatch alarm

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**.
3. Choose **Create alarm**.
4. On the **Specify metric and conditions** page, choose **Select metric**.
5. Choose **EC2 Spot, Fleet Request Metrics**, select a metric (for example, `TargetCapacity`), and then choose **Select metric**.

The **Specify metric and conditions** page appears, showing a graph and other information about the metric you selected.

6. For **Period**, choose the evaluation period for the alarm, for example, 1 minute. When evaluating the alarm, each period is aggregated into one data point.

 **Note**

A shorter period creates a more sensitive alarm.

7. For **Conditions**, define the alarm by defining the threshold condition. For example, you can define a threshold to trigger the alarm whenever the value of the metric is greater than or equal to 80 percent.
8. Under **Additional configuration**, for **Datapoints to alarm**, specify how many datapoints (evaluation periods) must be in the `ALARM` state to trigger the alarm, for example, 1

- evaluation period or 2 out of 3 evaluation periods. This creates an alarm that goes to ALARM state if that many consecutive periods are breaching. For more information, see [Evaluating an alarm](#) in the *Amazon CloudWatch User Guide*.
9. For **Missing data treatment**, choose one of the options (or leave the default of **Treat missing data as missing**). For more information, see [Configuring how CloudWatch alarms treat missing data](#) in the *Amazon CloudWatch User Guide*.
 10. Choose **Next**.
 11. (Optional) To receive notification of a scaling event, for **Notification**, you can choose or create the Amazon SNS topic you want to use to receive notifications. Otherwise, you can delete the notification now and add one later as needed.
 12. Choose **Next**.
 13. Under **Add a description**, enter a name and description for the alarm and choose **Next**.
 14. Choose **Create alarm**.

To configure a step scaling policy for your Spot Fleet (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose **Auto Scaling**.
4. If automatic scaling is not configured, choose **Configure**.
5. Use **Scale capacity between** to set the minimum and maximum capacity for your fleet. Scaling policies do not scale your fleet below the minimum capacity or above the maximum capacity.
6. For **Scaling policies, Policy type**, choose **Step scaling policy**.
7. Initially, **Scaling policies** contain step scaling policies named ScaleUp and ScaleDown. You can complete these policies, or choose **Remove policy** to delete them. You can also choose **Add policy**.
8. To define a policy, do the following:
 - a. For **Policy name**, enter a name for the policy.
 - b. For **Policy trigger**, select an existing alarm or choose **Create alarm** to open the Amazon CloudWatch console and create an alarm.
 - c. For **Modify capacity**, define the amount by which to scale and the lower and upper bound of the step adjustment. You can add or remove a specific number of instances or a percentage of the existing fleet size, or set the fleet to an exact size.

For example, to create a step scaling policy that increases the capacity of the fleet by 30 percent, choose Add, type 30 in the next field, and then choose percent. By default, the lower bound for an add policy is the alarm threshold and the upper bound is positive (+) infinity. By default, the upper bound for a remove policy is the alarm threshold and the lower bound is negative (-) infinity.

- d. (Optional) To add another step, choose **Add step**.
 - e. For **Cooldown period**, specify a new value (in seconds) or keep the default.
9. Choose **Save**.

To configure step scaling policies for your Spot Fleet using the AWS CLI

1. Register the Spot Fleet request as a scalable target using the [register-scalable-target](#) command.
2. Create a scaling policy using the [put-scaling-policy](#) command.
3. Create an alarm that triggers the scaling policy using the [put-metric-alarm](#) command.

Scale Spot Fleet using scheduled scaling

Scaling based on a schedule enables you to scale your application in response to predictable changes in demand. To use scheduled scaling, you create *scheduled actions*, which tell Spot Fleet to perform scaling activities at specific times. When you create a scheduled action, you specify an existing Spot Fleet, when the scaling activity should occur, minimum capacity, and maximum capacity. You can create scheduled actions that scale one time only or that scale on a recurring schedule.

You can only create a scheduled action for Spot Fleets that already exist. You can't create a scheduled action at the same time that you create a Spot Fleet.

Limitation

The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`, or `Spot blocks`.

To create a one-time scheduled action

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. Choose **Create Scheduled Action**.
5. For **Name**, specify a name for the scheduled action.
6. Enter a value for **Minimum capacity**, **Maximum capacity**, or both.
7. For **Recurrence**, choose **Once**.
8. (Optional) Choose a date and time for **Start time**, **End time**, or both.
9. Choose **Submit**.

To scale on a recurring schedule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. For **Recurrence**, choose one of the predefined schedules (for example, **Every day**), or choose **Custom** and enter a cron expression. For more information about the cron expressions supported by scheduled scaling, see [Cron Expressions](#) in the *Amazon CloudWatch Events User Guide*.
5. (Optional) Choose a date and time for **Start time**, **End time**, or both.
6. Choose **Submit**.

To edit a scheduled action

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. Select the scheduled action and choose **Actions**, **Edit**.
5. Make the needed changes and choose **Submit**.

To delete a scheduled action

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. Select the scheduled action and choose **Actions, Delete**.
5. When prompted for confirmation, choose **Delete**.

To manage scheduled scaling using the AWS CLI

Use the following commands:

- [put-scheduled-action](#)
- [describe-scheduled-actions](#)
- [delete-scheduled-action](#)

Monitor fleet events using Amazon EventBridge

When the state of an EC2 Fleet or Spot Fleet changes, the fleet emits a notification. The notification is made available as an event that is sent to Amazon EventBridge (formerly known as Amazon CloudWatch Events). Events are emitted on a best effort basis.

With Amazon EventBridge, you can create rules that trigger programmatic actions in response to an event. For example, you can create two EventBridge rules, one that's triggered when a fleet state changes, and one that's triggered when an instance in the fleet is terminated. You can configure the first rule so that, if the fleet state changes, the rule invokes an SNS topic to send an email notification to you. You can configure the second rule so that, if an instance is terminated, the rule invokes a Lambda function to launch a new instance.

Topics

- [EC2 Fleet event types](#)
- [Spot Fleet event types](#)
- [Create Amazon EventBridge rules](#)

EC2 Fleet event types

Note

Only fleets of type `maintain` and `request` emit events. Fleets of type `instant` do not emit events because they submit synchronous one-time requests, and the state of the fleet is known immediately in the response.

There are five EC2 Fleet event types. For each event type, there are several sub-types.

The events are sent to EventBridge in JSON format. The following fields in the event form the event pattern that is defined in the rule, and which trigger an action:

`"source": "aws.ec2fleet"`

Identifies that the event is from EC2 Fleet.

`"detail-type": "EC2 Fleet State Change"`

Identifies the event type.

`"detail": { "sub-type": "submitted" }`

Identifies the event sub-type.

Event types

- [EC2 Fleet State Change](#)
- [EC2 Fleet Spot Instance Request Change](#)
- [EC2 Fleet Instance Change](#)
- [EC2 Fleet Information](#)
- [EC2 Fleet Error](#)

EC2 Fleet State Change

EC2 Fleet sends an `EC2 Fleet State Change` event to Amazon EventBridge when an EC2 Fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "715ed6b3-b8fc-27fe-fad6-528c7b8bf8a2",  
    "detail-type": "EC2 Fleet State Change",  
    "source": "aws.ec2fleet",  
    "account": "123456789012",  
    "time": "2020-11-09T09:00:20Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-598fb973-87b7-422d-  
        be4d-6b0809bfff0a"  
    ],  
    "detail": {  
        "sub-type": "active"  
    }  
}
```

The possible values for sub-type are:

active

The EC2 Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances.

deleted

The EC2 Fleet request is deleted and has no running instances. The EC2 Fleet will be deleted two days after its instances are terminated.

deleted_running

The EC2 Fleet request is deleted and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.

deleted_terminating

The EC2 Fleet request is deleted and its instances are terminating. The request remains in this state until all instances are terminated.

expired

The EC2 Fleet request has expired. If the request was created with `TerminateInstancesWithExpiration` set, a subsequent terminated event indicates that the instances are terminated.

modify_in_progress

The EC2 Fleet request is being modified. The request remains in this state until the modification is fully processed.

modify_succeeded

The EC2 Fleet request was modified.

submitted

The EC2 Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.

progress

The EC2 Fleet request is in the process of being fulfilled.

EC2 Fleet Spot Instance Request Change

EC2 Fleet sends an EC2 Fleet Spot Instance Request Change event to Amazon EventBridge when a Spot Instance request in the fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "19331f74-bf4b-a3dd-0f1b-ddb1422032b9",  
    "detail-type": "EC2 Fleet Spot Instance Request Change",  
    "source": "aws.ec2fleet",  
    "account": "123456789012",  
    "time": "2020-11-09T09:00:05Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:fleet/  
        fleet-83fd4e48-552a-40ef-9532-82a3acca5f10"  
    ],  
    "detail": {
```

```
        "spot-instance-request-id": "sir-rmqsk6h",
        "description": "SpotInstanceRequestId sir-rmqsk6h, PreviousState:
cancelled_running",
        "sub-type": "cancelled"
    }
}
```

The possible values for sub-type are:

active

The Spot Instance request is fulfilled and has an associated Spot Instance.

cancelled

You cancelled the Spot Instance request, or the Spot Instance request expired.

disabled

You stopped the Spot Instance.

submitted

The Spot Instance request is submitted.

EC2 Fleet Instance Change

EC2 Fleet sends an EC2 Fleet Instance Change event to Amazon EventBridge when an instance in the fleet changes state.

The following is example data for this event.

```
{
    "version": "0",
    "id": "542ce428-c8f1-0608-c015-e8ed6522c5bc",
    "detail-type": "EC2 Fleet Instance Change",
    "source": "aws.ec2fleet",
    "account": "123456789012",
    "time": "2020-11-09T09:00:23Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-598fb973-87b7-422d-
be4d-6b0809bfff0a"
    ],
}
```

```
"detail": {  
    "instance-id": "i-0c594155dd5ff1829",  
    "description": "{\"instanceType\":\"c5.large\",\"image\":\"ami-6057e21a\",  
\"productDescription\":\"Linux/UNIX\",\"availabilityZone\":\"us-east-1d\"}",  
    "sub-type": "launched"  
}  
}
```

The possible values for sub-type are:

launched

A new instance was launched.

terminated

The instance was terminated.

termination_notified

An instance termination notification was sent when a Spot Instance was terminated by Amazon EC2 during scale-down, when the target capacity of the fleet was modified down, for example, from a target capacity of 4 to a target capacity of 3.

EC2 Fleet Information

EC2 Fleet sends an EC2 Fleet Information event to Amazon EventBridge when there is an error during fulfillment. The information event does not block the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "76529817-d605-4571-7224-d36cc1b2c0c4",  
    "detail-type": "EC2 Fleet Information",  
    "source": "aws.ec2fleet",  
    "account": "123456789012",  
    "time": "2020-11-09T08:17:07Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-8becf5fe-  
        bb9e-415d-8f54-3fa5a8628b91"
```

```
],
  "detail": {
    "description": "c4.xlarge, ami-0947d2ba12ee1ff75, Linux/UNIX, us-east-1a, Spot price in either SpotFleetRequestConfigData or SpotFleetLaunchSpecification or LaunchTemplate or LaunchTemplateOverrides is less than Spot market price $0.0619",
    "sub-type": "launchSpecUnusable"
  }
}
```

The possible values for sub-type are:

fleetProgressHalted

The price in every launch specification is not valid because it is below the Spot price (all the launch specifications have produced launchSpecUnusable events). A launch specification might become valid if the Spot price changes.

launchSpecTemporarilyBlacklisted

The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.

launchSpecUnusable

The price in a launch specification is not valid because it is below the Spot price.

registerWithLoadBalancersFailed

An attempt to register instances with load balancers failed. For more information, see the description of the event.

EC2 Fleet Error

EC2 Fleet sends an EC2 Fleet Error event to Amazon EventBridge when there is an error during fulfillment. The error event blocks the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{
  "version": "0",
  "id": "69849a22-6d0f-d4ce-602b-b47c1c98240e",
  "detail-type": "EC2 Fleet Error",
  "source": "aws.ec2fleet",
```

```
"account": "123456789012",
"time": "2020-10-07T01:44:24Z",
"region": "us-east-1",
"resources": [
    "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-9bb19bc6-60d3-4fd2-ae47-
d33e68eafa08"
],
"detail": {
    "description": "m3.large, ami-00068cd7555f543d5, Linux/UNIX: IPv6 is not
supported for the instance type 'm3.large'. ",
    "sub-type": "spotFleetRequestConfigurationInvalid"
}
}
```

The possible values for sub-type are:

iamFleetRoleInvalid

The EC2 Fleet does not have the required permissions to either launch or terminate an instance.

allLaunchSpecsTemporarilyBlacklisted

None of the configurations are valid, and several attempts to launch instances have failed. For more information, see the description of the event.

spotInstanceCountLimitExceeded

You've reached the limit on the number of Spot Instances that you can launch.

spotFleetRequestConfigurationInvalid

The configuration is not valid. For more information, see the description of the event.

Spot Fleet event types

There are five Spot Fleet event types. For each event type, there are several sub-types.

The events are sent to EventBridge in JSON format. The following fields in the event form the event pattern that is defined in the rule, and which trigger an action:

"source": "aws.ec2spotfleet"

Identifies that the event is from Spot Fleet.

```
"detail-type": "EC2 Spot Fleet State Change"
```

Identifies the event type.

```
"detail": { "sub-type": "submitted" }
```

Identifies the event sub-type.

Event types

- [EC2 Spot Fleet State Change](#)
- [EC2 Spot Fleet Spot Instance Request Change](#)
- [EC2 Spot Fleet Instance Change](#)
- [EC2 Spot Fleet Information](#)
- [EC2 Spot Fleet Error](#)

EC2 Spot Fleet State Change

Spot Fleet sends an EC2 Spot Fleet State Change event to Amazon EventBridge when a Spot Fleet changes state.

The following is example data for this event.

```
{
    "version": "0",
    "id": "d1af1091-6cc3-2e24-203a-3b870e455d5b",
    "detail-type": "EC2 Spot Fleet State Change",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-09T08:57:06Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-4b6d274d-0cea-4b2c-b3be-9dc627ad1f55"
    ],
    "detail": {
        "sub-type": "submitted"
    }
}
```

The possible values for sub-type are:

`active`

The Spot Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances.

`cancelled`

The Spot Fleet request is canceled and has no running instances. The Spot Fleet will be deleted two days after its instances are terminated.

`cancelled_running`

The Spot Fleet request is canceled and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.

`cancelled_terminating`

The Spot Fleet request is canceled and its instances are terminating. The request remains in this state until all instances are terminated.

`expired`

The Spot Fleet request has expired. If the request was created with `TerminateInstancesWithExpiration` set, a subsequent terminated event indicates that the instances are terminated.

`modify_in_progress`

The Spot Fleet request is being modified. The request remains in this state until the modification is fully processed.

`modify_succeeded`

The Spot Fleet request was modified.

`submitted`

The Spot Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.

`progress`

The Spot Fleet request is in the process of being fulfilled.

EC2 Spot Fleet Spot Instance Request Change

Spot Fleet sends an EC2 Spot Fleet Spot Instance Request Change event to Amazon EventBridge when a Spot Instance request in the fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "cd141ef0-14af-d670-a71d-fe46e9971bd2",  
    "detail-type": "EC2 Spot Fleet Spot Instance Request Change",  
    "source": "aws.ec2spotfleet",  
    "account": "123456789012",  
    "time": "2020-11-09T08:53:21Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-  
        a98d2133-941a-47dc-8b03-0f94c6852ad1"  
    ],  
    "detail": {  
        "spot-instance-request-id": "sir-a2w9gc5h",  
        "description": "SpotInstanceRequestId sir-a2w9gc5h, PreviousState:  
        cancelled_running",  
        "sub-type": "cancelled"  
    }  
}
```

The possible values for sub-type are:

active

The Spot Instance request is fulfilled and has an associated Spot Instance.

cancelled

You cancelled the Spot Instance request, or the Spot Instance request expired.

disabled

You stopped the Spot Instance.

submitted

The Spot Instance request is submitted.

EC2 Spot Fleet Instance Change

Spot Fleet sends an EC2 Spot Fleet Instance Change event to Amazon EventBridge when an instance in the fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "11591686-5bd7-bbaa-eb40-d46529c2710f",  
    "detail-type": "EC2 Spot Fleet Instance Change",  
    "source": "aws.ec2spotfleet",  
    "account": "123456789012",  
    "time": "2020-11-09T07:25:02Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-c8a764a4-bedc-4b62-  
        af9c-0095e6e3ba61"  
    ],  
    "detail": {  
        "instance-id": "i-08b90df1e09c30c9b",  
        "description": "{\"instanceType\":\"r4.2xlarge\",\"image\"::  
        \"ami-032930428bf1abbff\"},\"productDescription\":\"Linux/UNIX\",\"availabilityZone\"::  
        \"us-east-1a\"}",  
        "sub-type": "launched"  
    }  
}
```

The possible values for sub-type are:

launched

A new instance was launched.

terminated

The instance was terminated.

termination_notified

An instance termination notification was sent when a Spot Instance was terminated by Amazon EC2 during scale-down, when the target capacity of the fleet was modified down, for example, from a target capacity of 4 to a target capacity of 3.

EC2 Spot Fleet Information

Spot Fleet sends an EC2 Spot Fleet Information event to Amazon EventBridge when there is an error during fulfillment. The information event does not block the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "73a60f70-3409-a66c-635c-7f66c5f5b669",  
    "detail-type": "EC2 Spot Fleet Information",  
    "source": "aws.ec2spotfleet",  
    "account": "123456789012",  
    "time": "2020-11-08T20:56:12Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-2531ea06-  
        af18-4647-8757-7d69c94971b1"  
    ],  
    "detail": {  
        "description": "r3.8xlarge, ami-032930428bf1abbff, Linux/UNIX, us-east-1a, Spot  
        bid price is less than Spot market price $0.5291",  
        "sub-type": "launchSpecUnusable"  
    }  
}
```

The possible values for sub-type are:

fleetProgressHalted

The price in every launch specification is not valid because it is below the Spot price (all the launch specifications have produced launchSpecUnusable events). A launch specification might become valid if the Spot price changes.

launchSpecTemporarilyBlacklisted

The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.

launchSpecUnusable

The price in a launch specification is not valid because it is below the Spot price.

registerWithLoadBalancersFailed

An attempt to register instances with load balancers failed. For more information, see the description of the event.

EC2 Spot Fleet Error

Spot Fleet sends an EC2 Spot Fleet Error event to Amazon EventBridge when there is an error during fulfillment. The error event blocks the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "10adc4e7-675c-643e-125c-5bfa1b1ba5d2",  
    "detail-type": "EC2 Spot Fleet Error",  
    "source": "aws.ec2spotfleet",  
    "account": "123456789012",  
    "time": "2020-11-09T06:56:07Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/  
        sfr-38725d30-25f1-4f30-83ce-2907c56dba17"  
    ],  
    "detail": {  
        "description": "r4.2xlarge, ami-032930428bf1abbff, Linux/UNIX: The  
        associatePublicIPAddress parameter can only be specified for the network interface  
        with DeviceIndex 0. ",  
        "sub-type": "spotFleetRequestConfigurationInvalid"  
    }  
}
```

The possible values for sub-type are:

iamFleetRoleInvalid

The Spot Fleet does not have the required permissions to either launch or terminate an instance.

allLaunchSpecsTemporarilyBlacklisted

None of the configurations are valid, and several attempts to launch instances have failed. For more information, see the description of the event.

spotInstanceCountLimitExceeded

You've reached the limit on the number of Spot Instances that you can launch.

spotFleetRequestConfigurationInvalid

The configuration is not valid. For more information, see the description of the event.

Create Amazon EventBridge rules

When a notification of a state change is emitted for an EC2 Fleet or Spot Fleet, the event for the notification is sent to Amazon EventBridge. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes a target (or targets) specified in the rule.

You can write an EventBridge rule and automate what actions to take when the event pattern matches the rule.

Topics

- [Create Amazon EventBridge rules to monitor EC2 Fleet events](#)
- [Create Amazon EventBridge rules to monitor Spot Fleet events](#)

Create Amazon EventBridge rules to monitor EC2 Fleet events

When a notification of a state change is emitted for an EC2 Fleet, the event for the notification is sent to Amazon EventBridge in the form of a JSON file. You can write an EventBridge rule to automate what actions to take when an event pattern matches the rule. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes the target (or targets) specified in the rule.

The following fields form the event pattern that is defined in the rule:

"source": "aws.ec2fleet"

Identifies that the event is from EC2 Fleet.

```
"detail-type": "EC2 Fleet State Change"
```

Identifies the event type.

```
"detail": { "sub-type": "submitted" }
```

Identifies the event sub-type.

For the list of EC2 Fleet events and example event data, see [the section called “EC2 Fleet event types”](#).

Examples

- [Create an EventBridge rule to send a notification](#)
- [Create an EventBridge rule to trigger a Lambda function](#)

Create an EventBridge rule to send a notification

The following example creates an EventBridge rule to send an email, text message, or mobile push notification every time that Amazon EC2 emits an EC2 Fleet state change notification. The signal in this example is emitted as an EC2 Fleet State Change event, which triggers the action defined by the rule.

Before creating the EventBridge rule, you must create the Amazon SNS topic for the email, text message, or mobile push notification.

To create an EventBridge rule to send a notification when an EC2 Fleet state changes

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.
3. For **Define rule detail**, do the following:
 - a. Enter a **Name** for the rule, and, optionally, a description.
A rule can't have the same name as another rule in the same Region and on the same event bus.
 - b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.
 - c. For **Rule type**, choose **Rule with an event pattern**.

- d. Choose **Next**.
4. For **Build event pattern**, do the following:
- a. For **Event source**, choose **AWS events or EventBridge partner events**.
 - b. For **Event pattern**, for this example you'll specify the following event pattern to match the EC2 Fleet Instance Change event.

```
{  
  "source": ["aws.ec2fleet"],  
  "detail-type": ["EC2 Fleet Instance Change"]  
}
```

To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

- i. To use a template to create the event pattern, do the following:
 - A. Choose **Event pattern form**.
 - B. For **Event source**, choose **AWS services**.
 - C. For **AWS Service**, choose **EC2 Fleet**.
 - D. For **Event type**, choose **EC2 Fleet Instance Change**.
 - E. To customize the template, choose **Edit pattern** and make your changes to match the example event pattern.
 - ii. (Alternative) To specify a custom event pattern, do the following:
 - A. Choose **Custom pattern (JSON editor)**.
 - B. In the **Event pattern** box, add the event pattern for this example.
- c. Choose **Next**.
5. For **Select target(s)**, do the following:
- a. For **Target types**, choose **AWS service**.
 - b. For **Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.
 - c. For **Topic**, choose an existing topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.

- d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see [Creating Amazon EventBridge rules that react to events](#) (step 16) in the *Amazon EventBridge User Guide*.
 - e. Choose **Next**.
6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.
 7. For **Review and create**, do the following:
 - a. Review the details of the rule and modify them as necessary.
 - b. Choose **Create rule**.

For more information, see [Amazon EventBridge rules](#) and [Amazon EventBridge event patterns](#) in the *Amazon EventBridge User Guide*

Create an EventBridge rule to trigger a Lambda function

The following example creates an EventBridge rule to trigger a Lambda function every time that Amazon EC2 emits an EC2 Fleet instance change notification for when an instance is launched. The signal in this example is emitted as an `EC2 Fleet Instance Change` event, sub-type `launched`, which triggers the action defined by the rule.

Before creating the EventBridge rule, you must create the Lambda function.

To create the Lambda function to use in the EventBridge rule

1. Open the AWS Lambda console at <https://console.aws.amazon.com/lambda/>.
2. Choose **Create function**.
3. Enter a name for your function, configure the code, and then choose **Create function**.

For more information about using Lambda, see [Create a Lambda function with the console](#) in the *AWS Lambda Developer Guide*.

To create an EventBridge rule to trigger a Lambda function when an instance in an EC2 Fleet changes state

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.

3. For **Define rule detail**, do the following:

- a. Enter a **Name** for the rule, and, optionally, a description.

A rule can't have the same name as another rule in the same Region and on the same event bus.

- b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.
- c. For **Rule type**, choose **Rule with an event pattern**.
- d. Choose **Next**.

4. For **Build event pattern**, do the following:

- a. For **Event source**, choose **AWS events or EventBridge partner events**.
- b. For **Event pattern**, for this example you'll specify the following event pattern to match the EC2 Fleet Instance Change event and launched sub-type.

```
{  
  "source": ["aws.ec2fleet"],  
  "detail-type": ["EC2 Fleet Instance Change"],  
  "detail": {  
    "sub-type": ["launched"]  
  }  
}
```

To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

- i. To use a template to create the event pattern, do the following:
 - A. Choose **Event pattern form**.
 - B. For **Event source**, choose **AWS services**.
 - C. For **AWS Service**, choose **EC2 Fleet**.
 - D. For **Event type**, choose **EC2 Fleet Instance Change**.
 - E. Choose **Edit pattern**, and add "detail": {"sub-type": ["launched"]} to match the example event pattern. For proper JSON format, insert a comma (,) after the preceding square bracket ()].
- ii. (Alternative) To specify a custom event pattern, do the following:

- A. Choose **Custom pattern (JSON editor)**.
 - B. In the **Event pattern** box, add the event pattern for this example.
 - c. Choose **Next**.
5. For **Select target(s)**, do the following:
- a. For **Target types**, choose **AWS service**.
 - b. For **Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.
 - c. For **Topic**, choose **Lambda function**, and for **Function**, choose the function that you created to respond when the event occurs.
 - d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see [Creating Amazon EventBridge rules that react to events](#) (step 16) in the *Amazon EventBridge User Guide*.
 - e. Choose **Next**.
6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.
7. For **Review and create**, do the following:
- a. Review the details of the rule and modify them as necessary.
 - b. Choose **Create rule**.

For a tutorial on how to create a Lambda function and an EventBridge rule that runs the Lambda function, see [Tutorial: Log the State of an Amazon EC2 Instance Using EventBridge](#) in the *AWS Lambda Developer Guide*.

Create Amazon EventBridge rules to monitor Spot Fleet events

When a notification of a state change is emitted for a Spot Fleet, the event for the notification is sent to Amazon EventBridge in the form of a JSON file. You can write an EventBridge rule to automate what actions to take when an event pattern matches the rule. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes the target (or targets) specified in the rule.

The following fields form the event pattern that is defined in the rule:

```
"source": "aws.ec2spotfleet"
```

Identifies that the event is from Spot Fleet.

```
"detail-type": "EC2 Spot Fleet State Change"
```

Identifies the event type.

```
"detail": { "sub-type": "submitted" }
```

Identifies the event sub-type.

For the list of Spot Fleet events and example event data, see [the section called “Spot Fleet event types”](#).

Examples

- [Create an EventBridge rule to send a notification](#)
- [Create an EventBridge rule to trigger a Lambda function](#)

Create an EventBridge rule to send a notification

The following example creates an EventBridge rule to send an email, text message, or mobile push notification every time that Amazon EC2 emits a Spot Fleet state change notification. The signal in this example is emitted as an EC2 Spot Fleet State Change event, which triggers the action defined by the rule. Before creating the EventBridge rule, you must create the Amazon SNS topic for the email, text message, or mobile push notification.

To create an EventBridge rule to send a notification when a Spot Fleet state changes

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.
3. For **Define rule detail**, do the following:
 - a. Enter a **Name** for the rule, and, optionally, a description.

A rule can't have the same name as another rule in the same Region and on the same event bus.
 - b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.
 - c. For **Rule type**, choose **Rule with an event pattern**.

- d. Choose **Next**.
4. For **Build event pattern**, do the following:
- a. For **Event source**, choose **AWS events or EventBridge partner events**.
 - b. For **Event pattern**, for this example you'll specify the following event pattern to match the EC2 Spot Fleet Instance Change event.

```
{  
  "source": ["aws.ec2spotfleet"],  
  "detail-type": ["EC2 Spot Fleet Instance Change"]  
}
```

To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

- i. To use a template to create the event pattern, do the following:
 - A. Choose **Event pattern form**.
 - B. For **Event source**, choose **AWS services**.
 - C. For **AWS Service**, choose **EC2 Spot Fleet**.
 - D. For **Event type**, choose **EC2 Spot Fleet Instance Change**.
 - E. To customize the template, choose **Edit pattern** and make your changes to match the example event pattern.
 - ii. (Alternative) To specify a custom event pattern, do the following:
 - A. Choose **Custom pattern (JSON editor)**.
 - B. In the **Event pattern** box, add the event pattern for this example.
- c. Choose **Next**.
5. For **Select target(s)**, do the following:
- a. For **Target types**, choose **AWS service**.
 - b. For **Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.
 - c. For **Topic**, choose an existing topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.

- d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see [Creating Amazon EventBridge rules that react to events](#) (step 16) in the *Amazon EventBridge User Guide*.
 - e. Choose **Next**.
6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.
 7. For **Review and create**, do the following:
 - a. Review the details of the rule and modify them as necessary.
 - b. Choose **Create rule**.

For more information, see [Amazon EventBridge rules](#) and [Amazon EventBridge event patterns](#) in the *Amazon EventBridge User Guide*

Create an EventBridge rule to trigger a Lambda function

The following example creates an EventBridge rule to trigger a Lambda function every time that Amazon EC2 emits a Spot Fleet instance change notification for when an instance is launched. The signal in this example is emitted as an EC2 Spot Fleet Instance Change event, sub-type launched, which triggers the action defined by the rule.

Before creating the EventBridge rule, you must create the Lambda function.

To create the Lambda function to use in the EventBridge rule

1. Open the AWS Lambda console at <https://console.aws.amazon.com/lambda/>.
2. Choose **Create function**.
3. Enter a name for your function, configure the code, and then choose **Create function**.

For more information about using Lambda, see [Create a Lambda function with the console](#) in the *AWS Lambda Developer Guide*.

To create an EventBridge rule to trigger a Lambda function when an instance in a Spot Fleet changes state

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.

3. For **Define rule detail**, do the following:

- a. Enter a **Name** for the rule, and, optionally, a description.

A rule can't have the same name as another rule in the same Region and on the same event bus.

- b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.
- c. For **Rule type**, choose **Rule with an event pattern**.
- d. Choose **Next**.

4. For **Build event pattern**, do the following:

- a. For **Event source**, choose **AWS events or EventBridge partner events**.
- b. For **Event pattern**, for this example you'll specify the following event pattern to match the EC2 Spot Fleet Instance Change event and launched sub-type.

```
{  
  "source": ["aws.ec2spotfleet"],  
  "detail-type": ["EC2 Spot Fleet Instance Change"],  
  "detail": {  
    "sub-type": ["launched"]  
  }  
}
```

To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

- i. To use a template to create the event pattern, do the following:
 - A. Choose **Event pattern form**.
 - B. For **Event source**, choose **AWS services**.
 - C. For **AWS Service**, choose **EC2 Spot Fleet**.
 - D. For **Event type**, choose **EC2 Spot Fleet Instance Change**.
 - E. Choose **Edit pattern**, and add "detail": {"sub-type": ["launched"]} to match the example event pattern. For proper JSON format, insert a comma (,) after the preceding square bracket ()].
- ii. (Alternative) To specify a custom event pattern, do the following:

- A. Choose **Custom pattern (JSON editor)**.
 - B. In the **Event pattern** box, add the event pattern for this example.
 - c. Choose **Next**.
5. For **Select target(s)**, do the following:
- a. For **Target types**, choose **AWS service**.
 - b. For **Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.
 - c. For **Topic**, choose **Lambda function**, and for **Function**, choose the function that you created to respond when the event occurs.
 - d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see [Creating Amazon EventBridge rules that react to events](#) (step 16) in the *Amazon EventBridge User Guide*.
 - e. Choose **Next**.
6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.
7. For **Review and create**, do the following:
- a. Review the details of the rule and modify them as necessary.
 - b. Choose **Create rule**.

For a tutorial on how to create a Lambda function and an EventBridge rule that runs the Lambda function, see [Tutorial: Log the State of an Amazon EC2 Instance Using EventBridge](#) in the *AWS Lambda Developer Guide*.

Tutorials for EC2 Fleet and Spot Fleet

The following tutorials take you through the common processes for creating EC2 Fleets and Spot Fleets.

Tutorials

- [Tutorial: Use EC2 Fleet with instance weighting](#)
- [Tutorial: Use EC2 Fleet with On-Demand as the primary capacity](#)
- [Tutorial: Launch On-Demand Instances using targeted Capacity Reservations](#)

- [Tutorial: Launch instances into Capacity Blocks](#)
- [Tutorial: Use Spot Fleet with instance weighting](#)

Tutorial: Use EC2 Fleet with instance weighting

This tutorial uses a fictitious company called Example Corp to illustrate the process of requesting an EC2 Fleet using instance weighting.

Objective

Example Corp, a pharmaceutical company, wants to use the computational power of Amazon EC2 for screening chemical compounds that might be used to fight cancer.

Planning

Example Corp first reviews [Spot Best Practices](#). Next, Example Corp determines the requirements for their EC2 Fleet.

Instance types

Example Corp has a compute- and memory-intensive application that performs best with at least 60 GB of memory and eight virtual CPUs (vCPUs). They want to maximize these resources for the application at the lowest possible price. Example Corp decides that any of the following EC2 instance types would meet their needs:

Instance type	Memory (GiB)	vCPUs
r3.2xlarge	61	8
r3.4xlarge	122	16
r3.8xlarge	244	32

Target capacity in units

With instance weighting, target capacity can equal a number of instances (the default) or a combination of factors such as cores (vCPUs), memory (GiBs), and storage (GBs). By considering the

base for their application (60 GB of RAM and eight vCPUs) as one unit, Example Corp decides that 20 times this amount would meet their needs. So the company sets the target capacity of their EC2 Fleet request to 20.

Instance weights

After determining the target capacity, Example Corp calculates instance weights. To calculate the instance weight for each instance type, they determine the units of each instance type that are required to reach the target capacity as follows:

- r3.2xlarge (61.0 GB, 8 vCPUs) = 1 unit of 20
- r3.4xlarge (122.0 GB, 16 vCPUs) = 2 units of 20
- r3.8xlarge (244.0 GB, 32 vCPUs) = 4 units of 20

Therefore, Example Corp assigns instance weights of 1, 2, and 4 to the respective launch configurations in their EC2 Fleet request.

Price per unit hour

Example Corp uses the [On-Demand price](#) per instance hour as a starting point for their price. They could also use recent Spot prices, or a combination of the two. To calculate the price per unit hour, they divide their starting price per instance hour by the weight. For example:

Instance type	On-Demand price	Instance weight	Price per unit hour
r3.2xLarge	\$0.7	1	\$0.7
r3.4xLarge	\$1.4	2	\$0.7
r3.8xLarge	\$2.8	4	\$0.7

Example Corp could use a global price per unit hour of \$0.7 and be competitive for all three instance types. They could also use a global price per unit hour of \$0.7 and a specific price per unit hour of \$0.9 in the `r3.8xlarge` launch specification.

Verify permissions

Before creating an EC2 Fleet, Example Corp verifies that it has an IAM role with the required permissions. For more information, see [EC2 Fleet prerequisites](#).

Create a launch template

Next, Example Corp creates a launch template. The launch template ID is used in the following step. For more information, see [Create a launch template](#).

Create the EC2 Fleet

Example Corp creates a file, config.json, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-07b3bc7625cdab851",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "r3.2xlarge",
                    "SubnetId": "subnet-482e4972",
                    "WeightedCapacity": 1
                },
                {
                    "InstanceType": "r3.4xlarge",
                    "SubnetId": "subnet-482e4972",
                    "WeightedCapacity": 2
                },
                {
                    "InstanceType": "r3.8xlarge",
                    "MaxPrice": "0.90",
                    "SubnetId": "subnet-482e4972",
                    "WeightedCapacity": 4
                }
            ]
        }
    ],
}
```

```
"TargetCapacitySpecification": {  
    "TotalTargetCapacity": 20,  
    "DefaultTargetCapacityType": "spot"  
}  
}
```

Example Corp creates the EC2 Fleet using the following [create-fleet](#) command.

```
aws ec2 create-fleet \  
--cli-input-json file://config.json
```

For more information, see [Create an EC2 Fleet](#).

Fulfillment

The allocation strategy determines which Spot capacity pools your Spot Instances come from.

With the lowest-price strategy (which is the default strategy), the Spot Instances come from the pool with the lowest price per unit at the time of fulfillment. To provide 20 units of capacity, the EC2 Fleet launches either 20 `r3.2xlarge` instances (20 divided by 1), 10 `r3.4xlarge` instances (20 divided by 2), or 5 `r3.8xlarge` instances (20 divided by 4).

If Example Corp used the diversified strategy, the Spot Instances would come from all three pools. The EC2 Fleet would launch 6 `r3.2xlarge` instances (which provide 6 units), 3 `r3.4xlarge` instances (which provide 6 units), and 2 `r3.8xlarge` instances (which provide 8 units), for a total of 20 units.

Tutorial: Use EC2 Fleet with On-Demand as the primary capacity

This tutorial uses a fictitious company called ABC Online to illustrate the process of requesting an EC2 Fleet with On-Demand as the primary capacity, and Spot capacity if available.

Objective

ABC Online, a restaurant delivery company, wants to be able to provision Amazon EC2 capacity across EC2 instance types and purchasing options to achieve their desired scale, performance, and cost.

Plan

ABC Online requires a fixed capacity to operate during peak periods, but would like to benefit from increased capacity at a lower price. ABC Online determines the following requirements for their EC2 Fleet:

- On-Demand Instance capacity – ABC Online requires 15 On-Demand Instances to ensure that they can accommodate traffic at peak periods.
- Spot Instance capacity – ABC Online would like to improve performance, but at a lower price, by provisioning 5 Spot Instances.

Verify permissions

Before creating an EC2 Fleet, ABC Online verifies that it has an IAM role with the required permissions. For more information, see [EC2 Fleet prerequisites](#).

Create a launch template

Next, ABC Online creates a launch template. The launch template ID is used in the following step. For more information, see [Create a launch template](#).

Create the EC2 Fleet

ABC Online creates a file, config.json, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-07b3bc7625cdab851",  
                "Version": "2"  
            }  
        }  
    ],  
    "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 20,  
        "OnDemandTargetCapacity": 15,  
        "DefaultTargetCapacityType": "spot"  
    }  
}
```

}

ABC Online creates the EC2 Fleet using the following [create-fleet](#) command.

```
aws ec2 create-fleet \
--cli-input-json file://config.json
```

For more information, see [Create an EC2 Fleet](#).

Fulfillment

The allocation strategy determines that the On-Demand capacity is always fulfilled, while the balance of the target capacity is fulfilled as Spot if there is capacity and availability.

Tutorial: Launch On-Demand Instances using targeted Capacity Reservations

This tutorial walks you through all the steps that you must perform so that your EC2 Fleet launches On-Demand Instances into targeted Capacity Reservations.

You will learn how to configure a fleet to use targeted On-Demand Capacity Reservations first when launching On-Demand Instances. You will also learn how to configure the fleet so that, when the total On-Demand target capacity exceeds the number of available unused Capacity Reservations, the fleet uses the specified allocation strategy for selecting the instance pools in which to launch the remaining target capacity.

EC2 Fleet configuration

In this tutorial, the fleet configuration is as follows:

- Target capacity: 10 On-Demand Instances
- Total unused targeted Capacity Reservations: 6 (less than the fleet's On-Demand target capacity of 10 On-Demand Instances)
- Number of Capacity Reservation pools: 2 (us-east-1a and us-east-1b)
- Number of Capacity Reservations per pool: 3
- On-Demand allocation strategy: `lowest-price` (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

Note that you can also use the prioritized allocation strategy instead of the lowest-price allocation strategy.

To launch On-Demand Instances into targeted Capacity Reservations, you must perform a number of steps, as follows:

- [Step 1: Create Capacity Reservations](#)
- [Step 2: Create a Capacity Reservation resource group](#)
- [Step 3: Add the Capacity Reservations to the Capacity Reservation resource group](#)
- [\(Optional\) Step 4: View the Capacity Reservations in the resource group](#)
- [Step 5: Create a launch template that specifies that the Capacity Reservation targets a specific resource group](#)
- [\(Optional\) Step 6: Describe the launch template](#)
- [Step 7: Create an EC2 Fleet](#)
- [\(Optional\) Step 8: View the number of remaining unused Capacity Reservations](#)

Step 1: Create Capacity Reservations

Use the [create-capacity-reservation](#) command to create the Capacity Reservations, three for us-east-1a and another three for us-east-1b. Except for the Availability Zone, the other attributes of the Capacity Reservations are identical.

3 Capacity Reservations in us-east-1a

```
aws ec2 create-capacity-reservation \
    --availability-zone us-east-1a\
    --instance-type c5.xlarge\
    --instance-platform Linux/UNIX \
    --instance-count 3 \
    --instance-match-criteria targeted
```

Example of resulting Capacity Reservation ID

```
cr-1234567890abcdef1
```

3 Capacity Reservations in us-east-1b

```
aws ec2 create-capacity-reservation \
--availability-zone us-east-1b\
--instance-type c5.xlarge\
--instance-platform Linux/UNIX \
--instance-count 3 \
--instance-match-criteria targeted
```

Example of resulting Capacity Reservation ID

```
cr-54321abcdef567890
```

Step 2: Create a Capacity Reservation resource group

Use the `resource-groups` service and the [create-group](#) command to create a Capacity Reservation resource group. In this example, the resource group is named `my-cr-group`. For information about why you must create a resource group, see [Use Capacity Reservations for On-Demand Instances](#).

```
aws resource-groups create-group \
--name my-cr-group \
--configuration '{"Type":"AWS::EC2::CapacityReservationPool"}' \
'{"Type":"AWS::ResourceGroups::Generic", "Parameters": [{"Name": "allowed-resource-types", "Values": ["AWS::EC2::CapacityReservation"]}]}'
```

Step 3: Add the Capacity Reservations to the Capacity Reservation resource group

Use the `resource-groups` service and the [group-resources](#) command to add the Capacity Reservations that you created in Step 1 to the Capacity Reservations resource group. Note that you must reference the On-Demand Capacity Reservations by their ARNs.

```
aws resource-groups group-resources \
--group my-cr-group \
--resource-arns \
arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1 \
arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-54321abcdef567890
```

Example output

```
{  
  "Failed": [],
```

```
"Succeeded": [
    "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1",
    "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-54321abcdef567890"
]
```

(Optional) Step 4: View the Capacity Reservations in the resource group

Use the `resource-groups` service and the [list-group-resources](#) command to optionally describe the resource group to view its Capacity Reservations.

```
aws resource-groups list-group-resources --group my-cr-group
```

Example output

```
{
    "ResourceIdentifiers": [
        {
            "ResourceType": "AWS::EC2::CapacityReservation",
            "ResourceArn": "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1"
        },
        {
            "ResourceType": "AWS::EC2::CapacityReservation",
            "ResourceArn": "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-54321abcdef567890"
        }
    ]
}
```

Step 5: Create a launch template that specifies that the Capacity Reservation targets a specific resource group

Use the [create-launch-template](#) command to create a launch template in which to specify the Capacity Reservations to use. In this example, the fleet will use targeted Capacity Reservations, which have been added to a resource group. Therefore, the launch template data specifies that the Capacity Reservation targets a specific resource group. In this example, the launch template is named `my-launch-template`.

```
aws ec2 create-launch-template \
```

```
--launch-template-name my-launch-template \
--launch-template-data \
[{"ImageId": "ami-0123456789example",
 "CapacityReservationSpecification":
 {"CapacityReservationTarget":
 { "CapacityReservationResourceGroupArn": "arn:aws:resource-groups:us-east-1:123456789012:group/my-cr-group" }
 }
}'
```

(Optional) Step 6: Describe the launch template

Use the [describe-launch-template](#) command to optionally describe the launch template to view its configuration.

```
aws ec2 describe-launch-template-versions --launch-template-name my-launch-template
```

Example output

```
{ "LaunchTemplateVersions": [
 {
 "LaunchTemplateId": "lt-01234567890example",
 "LaunchTemplateName": "my-launch-template",
 "VersionNumber": 1,
 "CreateTime": "2021-01-19T20:50:19.000Z",
 "CreatedBy": "arn:aws:iam::123456789012:user/Admin",
 "DefaultVersion": true,
 "LaunchTemplateData": {
 "ImageId": "ami-0947d2ba12ee1ff75",
 "CapacityReservationSpecification": {
 "CapacityReservationTarget": {
 "CapacityReservationResourceGroupArn": "arn:aws:resource-groups:us-east-1:123456789012:group/my-cr-group"
 }
 }
 }
 ]
}
```

Step 7: Create an EC2 Fleet

Create an EC2 Fleet that specifies the configuration information for the instances that it will launch. The following EC2 Fleet configuration shows only the pertinent configurations for this example. The launch template `my-launch-template` is the launch template you created in Step 5. There are two instance pools, each with the same instance type (`c5.xlarge`), but with different Availability Zones (`us-east-1a` and `us-east-1b`). The price of the instance pools is the same because pricing is defined for the Region, not per Availability Zone. The total target capacity is 10, and the default target capacity type is on-demand. The On-Demand allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

 **Note**

The fleet type must be `instant`. Other fleet types do not support `use-capacity-reservations-first`.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "my-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "c5.xlarge",  
                    "AvailabilityZone": "us-east-1a"  
                },  
                {  
                    "InstanceType": "c5.xlarge",  
                    "AvailabilityZone": "us-east-1b"  
                }  
            ]  
        },  
        ],  
        "TargetCapacitySpecification": {  
            "TotalTargetCapacity": 10,  
            "DefaultTargetCapacityType": "on-demand"  
        },  
    ]}
```

```
"OnDemandOptions": {  
    "AllocationStrategy": "lowest-price",  
    "CapacityReservationOptions": {  
        "UsageStrategy": "use-capacity-reservations-first"  
    }  
,  
    "Type": "instant"  
}
```

After you create the instant fleet using the preceding configuration, the following 10 instances are launched to meet the target capacity:

- The Capacity Reservations are used first to launch 6 On-Demand Instances as follows:
 - 3 On-Demand Instances are launched into the 3 c5.xlarge targeted Capacity Reservations in us-east-1a
 - 3 On-Demand Instances are launched into the 3 c5.xlarge targeted Capacity Reservations in us-east-1b
- To meet the target capacity, 4 additional On-Demand Instances are launched into regular On-Demand capacity according to the On-Demand allocation strategy, which is lowest-price in this example. However, because the pools are the same price (because price is per Region and not per Availability Zone), the fleet launches the remaining 4 On-Demand Instances into either of the pools.

(Optional) Step 8: View the number of remaining unused Capacity Reservations

After the fleet is launched, you can optionally run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{ "CapacityReservationId": "cr-111",  
  "InstanceType": "c5.xlarge",  
  "AvailableInstanceCount": 0  
}  
  
{ "CapacityReservationId": "cr-222",  
  "InstanceType": "c5.xlarge",  
  "AvailableInstanceCount": 0  
}
```

Tutorial: Launch instances into Capacity Blocks

This tutorial walks you through the steps that you must perform so that your EC2 Fleet launches instances into Capacity Blocks.

You can use EC2 Fleet of type *instant* to launch instances into Capacity Blocks. For more information, see [Use an EC2 Fleet of type 'instant'](#).

In most cases, the target capacity of the EC2 Fleet request should be less than or equal to the available capacity of the Capacity Block reservation that you are targeting. Target capacity requests that exceed the limits of the Capacity Block reservation will not be fulfilled. If the target capacity request exceeds the limits of your Capacity Block reservation, you will receive an Insufficient Capacity Exception for the capacity that exceeds the limits of your Capacity Block reservation.

Note

For Capacity Blocks, EC2 Fleet will not fallback to launching On-Demand Instances for the remainder of the desired target capacity.

If EC2 Fleet is unable to fulfill the requested target capacity in an available Capacity Block reservation, EC2 Fleet will fulfill as much capacity as it can and return the instances that it was able to launch. You can repeat the call to EC2 Fleet again until all the instances are provisioned.

After configuring the EC2 Fleet request, you must wait until the start date of your Capacity Block reservation. If you make requests to EC2 Fleet to launch into a Capacity Block that hasn't started yet, you will receive an Insufficient Capacity Error.

After your Capacity Block reservation becomes active, you can make EC2 Fleet API calls and provision the instances into your Capacity Block based on the parameters you selected. Instances running in the Capacity Block continue to run until you stop or terminate them through a separate Amazon EC2 API call or until Amazon EC2 terminates the instances when the Capacity Block reservation ends.

Considerations

- Multiple Capacity Blocks in the same CreateFleet request aren't supported.
- Using `OnDemandTargetCapacity` or `SpotTargetCapacity` while also setting `capacity-block` as the `DefaultTargetCapacity` isn't supported.

- If `DefaultTargetCapacityType` is set to `capacity-block`, you can't provide `OnDemandOptions::CapacityReservationOptions`. An exception will occur.

Create a launch template

The launch template ID is used in the following step. For more information, see [Create a launch template](#).

To configure the launch template, for `InstanceMarketOptionsRequest`, set `MarketType` to `capacity-block`. Specify the Capacity Block reservation ID that you are targeting by setting the `CapacityReservationID` parameter.

Create the EC2 Fleet

Create a file, `config.json`, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "CBR-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "p5.48xlarge",  
                    "AvailabilityZone": "us-east-1a"  
                },  
            ]  
        },  
        {  
            "TargetCapacitySpecification": {  
                "TotalTargetCapacity": 10,  
                "DefaultTargetCapacityType": "capacity-block"  
            },  
            "Type": "instant"  
        }  
    ]  
}
```

Use the following [create-fleet](#) command.

```
aws ec2 create-fleet \
```

```
--cli-input-json file://config.json
```

For more information, see [Create an EC2 Fleet](#).

Tutorial: Use Spot Fleet with instance weighting

This tutorial uses a fictitious company called Example Corp to illustrate the process of requesting a Spot Fleet using instance weighting.

Objective

Example Corp, a pharmaceutical company, wants to leverage the computational power of Amazon EC2 for screening chemical compounds that might be used to fight cancer.

Planning

Example Corp first reviews [Spot Best Practices](#). Next, Example Corp determines the following requirements for their Spot Fleet.

Instance types

Example Corp has a compute- and memory-intensive application that performs best with at least 60 GB of memory and eight virtual CPUs (vCPUs). They want to maximize these resources for the application at the lowest possible price. Example Corp decides that any of the following EC2 instance types would meet their needs:

Instance type	Memory (GiB)	vCPUs
r3.2xlarge	61	8
r3.4xlarge	122	16
r3.8xlarge	244	32

Target capacity in units

With instance weighting, target capacity can equal a number of instances (the default) or a combination of factors such as cores (vCPUs), memory (GiBs), and storage (GBs). By considering the base for their application (60 GB of RAM and eight vCPUs) as 1 unit, Example Corp decides that 20

times this amount would meet their needs. So the company sets the target capacity of their Spot Fleet request to 20.

Instance weights

After determining the target capacity, Example Corp calculates instance weights. To calculate the instance weight for each instance type, they determine the units of each instance type that are required to reach the target capacity as follows:

- r3.2xlarge (61.0 GB, 8 vCPUs) = 1 unit of 20
- r3.4xlarge (122.0 GB, 16 vCPUs) = 2 units of 20
- r3.8xlarge (244.0 GB, 32 vCPUs) = 4 units of 20

Therefore, Example Corp assigns instance weights of 1, 2, and 4 to the respective launch configurations in their Spot Fleet request.

Price per unit hour

Example Corp uses the [On-Demand price](#) per instance hour as a starting point for their price. They could also use recent Spot prices, or a combination of the two. To calculate the price per unit hour, they divide their starting price per instance hour by the weight. For example:

Instance type	On-Demand price	Instance weight	Price per unit hour
r3.2xLarge	\$0.7	1	\$0.7
r3.4xLarge	\$1.4	2	\$0.7
r3.8xLarge	\$2.8	4	\$0.7

Example Corp could use a global price per unit hour of \$0.7 and be competitive for all three instance types. They could also use a global price per unit hour of \$0.7 and a specific price per unit hour of \$0.9 in the r3.8xlarge launch specification.

Verify permissions

Before creating a Spot Fleet request, Example Corp verifies that it has an IAM role with the required permissions. For more information, see [Spot Fleet permissions](#).

Create the request

Example Corp creates a file, config.json, with the following configuration for its Spot Fleet request:

```
{  
  "SpotPrice": "0.70",  
  "TargetCapacity": 20,  
  "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
  "LaunchSpecifications": [  
    {  
      "ImageId": "ami-1a2b3c4d",  
      "InstanceType": "r3.2xlarge",  
      "SubnetId": "subnet-482e4972",  
      "WeightedCapacity": 1  
    },  
    {  
      "ImageId": "ami-1a2b3c4d",  
      "InstanceType": "r3.4xlarge",  
      "SubnetId": "subnet-482e4972",  
      "WeightedCapacity": 2  
    },  
    {  
      "ImageId": "ami-1a2b3c4d",  
      "InstanceType": "r3.8xlarge",  
      "SubnetId": "subnet-482e4972",  
      "SpotPrice": "0.90",  
      "WeightedCapacity": 4  
    }  
  ]  
}
```

Example Corp creates the Spot Fleet request using the [request-spot-fleet](#) command.

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

For more information, see [Spot Fleet request types](#).

Fulfillment

The allocation strategy determines which Spot capacity pools your Spot Instances come from.

With the `lowestPrice` strategy (which is the default strategy), the Spot Instances come from the pool with the lowest price per unit at the time of fulfillment. To provide 20 units of capacity, the Spot Fleet launches either 20 `r3.2xlarge` instances (20 divided by 1), 10 `r3.4xlarge` instances (20 divided by 2), or 5 `r3.8xlarge` instances (20 divided by 4).

If Example Corp used the diversified strategy, the Spot Instances would come from all three pools. The Spot Fleet would launch 6 `r3.2xlarge` instances (which provide 6 units), 3 `r3.4xlarge` instances (which provide 6 units), and 2 `r3.8xlarge` instances (which provide 8 units), for a total of 20 units.

Example configurations for EC2 Fleet and Spot Fleet

The following examples show launch configurations that you can use to create EC2 Fleets and Spot Fleets.

Topics

EC2 Fleet example configurations

The following examples show launch configurations that you can use with the [create-fleet](#) command to create an EC2 Fleet. For more information about the parameters, see [create-fleet](#) in the *AWS CLI Command Reference*.

Examples

- [Example 1: Launch Spot Instances as the default purchasing option](#)
- [Example 2: Launch On-Demand Instances as the default purchasing option](#)
- [Example 3: Launch On-Demand Instances as the primary capacity](#)
- [Example 4: Launch Spot Instances using the lowest-price allocation strategy](#)
- [Example 5: Launch On-Demand Instances using multiple Capacity Reservations](#)
- [Example 6: Launch On-Demand Instances using Capacity Reservations when the total target capacity exceeds the number of unused Capacity Reservations](#)
- [Example 7: Launch On-Demand Instances using targeted Capacity Reservations](#)
- [Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances](#)

- [Example 9: Launch Spot Instances in a capacity-optimized fleet](#)
- [Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities](#)
- [Example 11: Launch Spot Instances in a price-capacity-optimized fleet](#)
- [Example 12: Configure attribute-based instance type selection](#)

Example 1: Launch Spot Instances as the default purchasing option

The following example specifies the minimum parameters required in an EC2 Fleet: a launch template, target capacity, and default purchasing option. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing option is spot, which results in the fleet launching 2 Spot Instances.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0e8c754449b27161c",  
                "Version": "1"  
            }  
        },  
        {"  
            "TargetCapacitySpecification": {  
                "TotalTargetCapacity": 2,  
                "DefaultTargetCapacityType": "spot"  
            }  
        }  
    ]  
}
```

Example 2: Launch On-Demand Instances as the default purchasing option

The following example specifies the minimum parameters required in an EC2 Fleet: a launch template, target capacity, and default purchasing option. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing option is on-demand, which results in the fleet launching 2 On-Demand Instances.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0e8c754449b27161c",  
                "Version": "1"  
            }  
        }  
    ]  
}
```

```
        "LaunchTemplateSpecification": {
            "LaunchTemplateId": "lt-0e8c754449b27161c",
            "Version": "1"
        }

    },
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "DefaultTargetCapacityType": "on-demand"
    }
}
```

Example 3: Launch On-Demand Instances as the primary capacity

The following example specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing option is spot. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfill the total target capacity. The purchasing option for the difference is calculated as `TotalTargetCapacity - OnDemandTargetCapacity = DefaultTargetCapacityType`, which results in the fleet launching 1 Spot Instance.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            }

        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "OnDemandTargetCapacity": 1,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Example 4: Launch Spot Instances using the lowest-price allocation strategy

If the allocation strategy for Spot Instances is not specified, the default allocation strategy, which is lowest-price, is used. The following example uses the lowest-price allocation strategy. The three launch specifications, which override the launch template, have different instance types but the same weighted capacity and subnet. The total target capacity is 2 instances and the default purchasing option is spot. The EC2 Fleet launches 2 Spot Instances using the instance type of the launch specification with the lowest price.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0e8c754449b27161c",  
                "Version": "1"  
            }  
        },  
        {  
            "Overrides": [  
                {  
                    "InstanceType": "c4.large",  
                    "WeightedCapacity": 1,  
                    "SubnetId": "subnet-a4f6c5d3"  
                },  
                {  
                    "InstanceType": "c3.large",  
                    "WeightedCapacity": 1,  
                    "SubnetId": "subnet-a4f6c5d3"  
                },  
                {  
                    "InstanceType": "c5.large",  
                    "WeightedCapacity": 1,  
                    "SubnetId": "subnet-a4f6c5d3"  
                }  
            ]  
        }  
    ],  
    "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 2,  
        "DefaultTargetCapacityType": "spot"  
    }  
}
```

Example 5: Launch On-Demand Instances using multiple Capacity Reservations

You can configure a fleet to use On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how the fleet selects the Capacity Reservations to use when there are more Capacity Reservations than are needed to fulfil the target capacity.

In this example, the fleet configuration is as follows:

- Target capacity: 12 On-Demand Instances
- Total unused Capacity Reservations: 15 (more than the fleet's target capacity of 12 On-Demand Instances)
- Number of Capacity Reservation pools: 3 (`m5.large`, `m4.xlarge`, and `m4.2xlarge`)
- Number of Capacity Reservations per pool: 5
- On-Demand allocation strategy: `lowest-price` (When there are multiple unused Capacity Reservations in multiple instance pools, the fleet determines the pools in which to launch the On-Demand Instances based on the On-Demand allocation strategy.)

Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

Capacity Reservations

The account has the following 15 unused Capacity Reservations in 3 different pools. The number of Capacity Reservations in each pool is indicated by `AvailableInstanceCount`.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "m5.large",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "m4.xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}  
  
{  
    "CapacityReservationId": "cr-333",  
    "InstanceType": "m4.2xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}
```

```
"InstanceType": "m4.xlarge",
"InstancePlatform": "Linux/UNIX",
"AvailabilityZone": "us-east-1a",
"AvailableInstanceCount": 5,
"InstanceMatchCriteria": "open",
"State": "active"
}

{
"CapacityReservationId": "cr-333",
"InstanceType": "m4.2xlarge",
"InstancePlatform": "Linux/UNIX",
"AvailabilityZone": "us-east-1a",
"AvailableInstanceCount": 5,
"InstanceMatchCriteria": "open",
"State": "active"
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 12, and the default target capacity type is on-demand. The On-Demand allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

In this example, the On-Demand Instance price is:

- m5.large – \$0.096 per hour
- m4.xlarge – \$0.20 per hour
- m4.2xlarge – \$0.40 per hour

Note

The fleet type must be of type instant. Other fleet types do not support use-capacity-reservations-first.

```
{
  "LaunchTemplateConfigs": [
```

```
{  
    "LaunchTemplateSpecification": {  
        "LaunchTemplateId": "lt-abc1234567example",  
        "Version": "1"  
    },  
    "Overrides": [  
        {  
            "InstanceType": "m5.large",  
            "AvailabilityZone": "us-east-1a",  
            "WeightedCapacity": 1  
        },  
        {  
            "InstanceType": "m4.xlarge",  
            "AvailabilityZone": "us-east-1a",  
            "WeightedCapacity": 1  
        },  
        {  
            "InstanceType": "m4.2xlarge",  
            "AvailabilityZone": "us-east-1a",  
            "WeightedCapacity": 1  
        }  
    ]  
},  
    "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 12,  
        "DefaultTargetCapacityType": "on-demand"  
    },  
    "OnDemandOptions": {  
        "AllocationStrategy": "lowest-price"  
        "CapacityReservationOptions": {  
            "UsageStrategy": "use-capacity-reservations-first"  
        }  
    },  
    "Type": "instant",  
}
```

After you create the instant fleet using the preceding configuration, the following 12 instances are launched to meet the target capacity:

- 5 m5.large On-Demand Instances in us-east-1a – m5.large in us-east-1a is the lowest price, and there are 5 available unused m5.large Capacity Reservations

- 5 m4.xlarge On-Demand Instances in us-east-1a – m4.xlarge in us-east-1a is the next lowest price, and there are 5 available unused m4.xlarge Capacity Reservations
- 2 m4.2xlarge On-Demand Instances in us-east-1a – m4.2xlarge in us-east-1a is the third lowest price, and there are 5 available unused m4.2xlarge Capacity Reservations of which only 2 are needed to meet the target capacity

After the fleet is launched, you can run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the m5.large and m4.xlarge Capacity Reservations were used, with 3 m4.2xlarge Capacity Reservations remaining unused.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "m5.large",  
    "AvailableInstanceCount": 0  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "m4.xlarge",  
    "AvailableInstanceCount": 0  
}  
  
{  
    "CapacityReservationId": "cr-333",  
    "InstanceType": "m4.2xlarge",  
    "AvailableInstanceCount": 3  
}
```

Example 6: Launch On-Demand Instances using Capacity Reservations when the total target capacity exceeds the number of unused Capacity Reservations

You can configure a fleet to use On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how the fleet selects the instance pools in which to launch On-Demand Instances when the total target capacity exceeds the number of available unused Capacity Reservations.

In this example, the fleet configuration is as follows:

- Target capacity: 16 On-Demand Instances
- Total unused Capacity Reservations: 15 (less than the fleet's target capacity of 16 On-Demand Instances)
- Number of Capacity Reservation pools: 3 (m5.large, m4.xlarge, and m4.2xlarge)
- Number of Capacity Reservations per pool: 5
- On-Demand allocation strategy: lowest-price (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

Note that you can also use the prioritized allocation strategy instead of the lowest-price allocation strategy.

Capacity Reservations

The account has the following 15 unused Capacity Reservations in 3 different pools. The number of Capacity Reservations in each pool is indicated by AvailableInstanceCount.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "m5.large",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "m4.xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}  
  
{  
    "CapacityReservationId": "cr-333",  
    "InstanceType": "m4.2xlarge",  
}
```

```
"InstancePlatform": "Linux/UNIX",
"AvailabilityZone": "us-east-1a",
"AvailableInstanceCount":5,
"InstanceMatchCriteria": "open",
"State": "active"
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 16, and the default target capacity type is on-demand. The On-Demand allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

In this example, the On-Demand Instance price is:

- m5.large – \$0.096 per hour
- m4.xlarge – \$0.20 per hour
- m4.2xlarge – \$0.40 per hour

Note

The fleet type must be instant. Other fleet types do not support use-capacity-reservations-first.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            }
        },
        "Overrides": [
            {
                "InstanceType": "m5.large",
                "AvailabilityZone": "us-east-1a",
                "WeightedCapacity": 1
            }
        ]
    ]
}
```

```
        },
        {
            "InstanceType": "m4.xlarge",
            "AvailabilityZone": "us-east-1a",
            "WeightedCapacity": 1
        },
        {
            "InstanceType": "m4.2xlarge",
            "AvailabilityZone": "us-east-1a",
            "WeightedCapacity": 1
        }
    ]
}

],
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 16,
    "DefaultTargetCapacityType": "on-demand"
},
"OnDemandOptions": {
    "AllocationStrategy": "lowest-price"
    "CapacityReservationOptions": {
        "UsageStrategy": "use-capacity-reservations-first"
    }
},
"Type": "instant",
}
```

After you create the instant fleet using the preceding configuration, the following 16 instances are launched to meet the target capacity:

- 6 m5.large On-Demand Instances in us-east-1a – m5.large in us-east-1a is the lowest price, and there are 5 available unused m5.large Capacity Reservations. The Capacity Reservations are used first to launch 5 On-Demand Instances. After the remaining m4.xlarge and m4.2xlarge Capacity Reservations are used, to meet the target capacity an additional On-Demand Instance is launched according to the On-Demand allocation strategy, which is lowest-price in this example.
- 5 m4.xlarge On-Demand Instances in us-east-1a – m4.xlarge in us-east-1a is the next lowest price, and there are 5 available unused m4.xlarge Capacity Reservations
- 5 m4.2xlarge On-Demand Instances in us-east-1a – m4.2xlarge in us-east-1a is the third lowest price, and there are 5 available unused m4.2xlarge Capacity Reservations

After the fleet is launched, you can run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "m5.large",  
    "AvailableInstanceCount": 0  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "m4.xlarge",  
    "AvailableInstanceCount": 0  
}  
  
{  
    "CapacityReservationId": "cr-333",  
    "InstanceType": "m4.2xlarge",  
    "AvailableInstanceCount": 0  
}
```

Example 7: Launch On-Demand Instances using targeted Capacity Reservations

You can configure a fleet to use targeted On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how to launch On-Demand Instances into targeted Capacity Reservations, where the attributes of the Capacity Reservations are the same except for their Availability Zones (`us-east-1a` and `us-east-1b`). It also demonstrates how the fleet selects the instance pools in which to launch On-Demand Instances when the total target capacity exceeds the number of available unused Capacity Reservations.

In this example, the fleet configuration is as follows:

- Target capacity: 10 On-Demand Instances
- Total unused targeted Capacity Reservations: 6 (less than the fleet's On-Demand target capacity of 10 On-Demand Instances)
- Number of Capacity Reservation pools: 2 (`us-east-1a` and `us-east-1b`)
- Number of Capacity Reservations per pool: 3

- On-Demand allocation strategy: lowest-price (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

Note that you can also use the prioritized allocation strategy instead of the lowest-price allocation strategy.

For a walkthrough of the procedures that you must perform to accomplish this example, see [Tutorial: Launch On-Demand Instances using targeted Capacity Reservations](#).

Capacity Reservations

The account has the following 6 unused Capacity Reservations in 2 different pools. In this example, the pools differ by their Availability Zones. The number of Capacity Reservations in each pool is indicated by AvailableInstanceCount.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "c5.xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 3,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "c5.xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1b",  
    "AvailableInstanceCount": 3,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 10, and the default target capacity type is on-demand. The On-Demand

allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

In this example, the On-Demand Instance price for c5.xlarge in us-east-1 is \$0.17 per hour.

Note

The fleet type must be instant. Other fleet types do not support use-capacity-reservations-first.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "my-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "c5.xlarge",  
                    "AvailabilityZone": "us-east-1a"  
                },  
                {  
                    "InstanceType": "c5.xlarge",  
                    "AvailabilityZone": "us-east-1b"  
                }  
            ]  
        },  
        ],  
        "TargetCapacitySpecification": {  
            "TotalTargetCapacity": 10,  
            "DefaultTargetCapacityType": "on-demand"  
        },  
        "OnDemandOptions": {  
            "AllocationStrategy": "lowest-price",  
            "CapacityReservationOptions": {  
                "UsageStrategy": "use-capacity-reservations-first"  
            }  
        },  
        "Type": "instant"  
    ]  
}
```

After you create the instant fleet using the preceding configuration, the following 10 instances are launched to meet the target capacity:

- The Capacity Reservations are used first to launch 6 On-Demand Instances as follows:
 - 3 On-Demand Instances are launched into the 3 c5.xlarge targeted Capacity Reservations in us-east-1a
 - 3 On-Demand Instances are launched into the 3 c5.xlarge targeted Capacity Reservations in us-east-1b
- To meet the target capacity, 4 additional On-Demand Instances are launched into regular On-Demand capacity according to the On-Demand allocation strategy, which is lowest-price in this example. However, because the pools are the same price (because price is per Region and not per Availability Zone), the fleet launches the remaining 4 On-Demand Instances into either of the pools.

After the fleet is launched, you can run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "c5.xlarge",  
    "AvailableInstanceCount": 0  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "c5.xlarge",  
    "AvailableInstanceCount": 0  
}
```

Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances

The following example configures the EC2 Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation for a Spot Instance in the fleet. To configure the automatic replacement of Spot Instances, for `ReplacementStrategy`, specify `launch-before-terminate`. To configure the time delay from when the new replacement Spot Instances are launched to when the old Spot Instances are automatically deleted, for `termination-delay`, specify a value in seconds. For more information, see [Configuration options](#).

Note

We recommend using launch-before-terminate only if you can predict how long your instance shutdown procedures will take to complete so that the old instances are only terminated after these procedures are completed. You are charged for all instances while they are running.

The effectiveness of the Capacity Rebalancing strategy depends on the number of Spot capacity pools specified in the EC2 Fleet request. We recommend that you configure the fleet with a diversified set of instance types and Availability Zones, and for AllocationStrategy, specify capacity-optimized. For more information about what you should consider when configuring an EC2 Fleet for Capacity Rebalancing, see [Capacity Rebalancing](#).

```
{  
    "ExcessCapacityTerminationPolicy": "termination",  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "LaunchTemplate",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "c3.large",  
                    "WeightedCapacity": 1,  
                    "Placement": {  
                        "AvailabilityZone": "us-east-1a"  
                    }  
                },  
                {  
                    "InstanceType": "c4.large",  
                    "WeightedCapacity": 1,  
                    "Placement": {  
                        "AvailabilityZone": "us-east-1a"  
                    }  
                },  
                {  
                    "InstanceType": "c5.large",  
                    "WeightedCapacity": 1,  
                    "Placement": {  
                        "AvailabilityZone": "us-east-1a"  
                    }  
                }  
            ]  
        }  
    ]  
}
```

```
        "AvailabilityZone": "us-east-1a"
    }
]
},
],
"TargetCapacitySpecification": {

            "ReplacementStrategy": "launch-before-terminate",
            "TerminationDelay": "720"
        }
    }
}
}
```

Example 9: Launch Spot Instances in a capacity-optimized fleet

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for capacity. To optimize for capacity, you must set AllocationStrategy to capacity-optimized.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [

```

```
{  
    "InstanceType": "r4.2xlarge",  
    "Placement": {  
        "AvailabilityZone": "us-west-2a"  
    },  
},  
{  
    "InstanceType": "m4.2xlarge",  
    "Placement": {  
        "AvailabilityZone": "us-west-2b"  
    },  
},  
{  
    "InstanceType": "c5.2xlarge",  
    "Placement": {  
        "AvailabilityZone": "us-west-2b"  
    }  
}  
]  
]  
],  
"TargetCapacitySpecification": {  
    "TotalTargetCapacity": 50,  
    "DefaultTargetCapacityType": "spot"  
}  
}  
}
```

Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for capacity while using priority on a best-effort basis.

When using the capacity-optimized-prioritized allocation strategy, you can use the `Priority` parameter to specify the priorities of the Spot capacity pools, where the lower the number the higher priority. You can also set the same priority for several Spot capacity pools if you favor them equally. If you do not set a priority for a pool, the pool will be considered last in terms of priority.

To prioritize Spot capacity pools, you must set `AllocationStrategy` to `capacity-optimized-prioritized`. EC2 Fleet will optimize for capacity first, but will honor the priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect EC2 Fleet's ability to

provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters.

In the following example, the three launch specifications specify three Spot capacity pools. Each pool is prioritized, where the lower the number the higher priority. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with the highest priority on a best-effort basis, but optimizes for capacity first.

```
{  
    "SpotOptions": {  
        "AllocationStrategy": "capacity-optimized-prioritized"  
    },  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "my-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "r4.2xlarge",  
                    "Priority": 1,  
                    "Placement": {  
                        "AvailabilityZone": "us-west-2a"  
                    },  
                },  
                {  
                    "InstanceType": "m4.2xlarge",  
                    "Priority": 2,  
                    "Placement": {  
                        "AvailabilityZone": "us-west-2b"  
                    },  
                },  
                {  
                    "InstanceType": "c5.2xlarge",  
                    "Priority": 3,  
                    "Placement": {  
                        "AvailabilityZone": "us-west-2b"  
                    }  
                }  
            ]  
        }  
    ],  
}
```

```
"TargetCapacitySpecification": {  
    "TotalTargetCapacity": 50,  
    "DefaultTargetCapacityType": "spot"  
}
```

Example 11: Launch Spot Instances in a price-capacity-optimized fleet

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for both capacity and lowest price. To optimize for capacity while taking price into consideration, you must set the Spot AllocationStrategy to price-capacity-optimized.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching while also choosing the pool that is the lowest priced.

```
{  
    "SpotOptions": {  
        "AllocationStrategy": "price-capacity-optimized",  
        "MinTargetCapacity": 2,  
        "SingleInstanceType": true  
    },  
    "OnDemandOptions": {  
        "AllocationStrategy": "lowest-price"  
    },  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "my-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "r4.2xlarge",  
                    "Placement": {  
                        "AvailabilityZone": "us-west-2a"  
                    },  
                },  
                {  
                    "InstanceType": "m4.2xlarge",  
                    "Placement": {  
                        "AvailabilityZone": "us-west-2b"  
                    }  
                }  
            ]  
        }  
    ]  
}
```

```
        },
        ],
        {
            "InstanceType": "c5.2xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2b"
            }
        }
    ]
},
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 50,
    "OnDemandTargetCapacity": 0,
    "SpotTargetCapacity": 50,
    "DefaultTargetCapacityType": "spot"
},
"Type": "instant"
}
```

Example 12: Configure attribute-based instance type selection

The following example demonstrates how to configure an EC2 Fleet to use attribute-based instance type selection for identifying instance types. To specify the required instance attributes, you specify the attributes in the `InstanceRequirements` structure.

In the following example, two instance attributes are specified:

- `VCpuCount` – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- `MemoryMiB` – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when [EC2 Fleet provisions the fleet](#).

For a list and descriptions of all the possible attributes that you can specify, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

{

```
"SpotOptions": {  
    "AllocationStrategy": "price-capacity-optimized"  
},  
"LaunchTemplateConfigs": [{  
    "LaunchTemplateSpecification": {  
        "LaunchTemplateName": "my-launch-template",  
        "Version": "1"  
    },  
    "Overrides": [{  
        "InstanceRequirements": {  
            "VCpuCount": {  
                "Min": 2  
            },  
            "MemoryMiB": {  
                "Min": 4  
            }  
        }  
    }]  
}],  
"TargetCapacitySpecification": {  
    "TotalTargetCapacity": 20,  
    "DefaultTargetCapacityType": "spot"  
},  
"Type": "instant"  
}
```

Spot Fleet example configurations

The following examples show launch configurations that you can use with the [request-spot-fleet](#) command to create a Spot Fleet request. For more information, see [Create a Spot Fleet request](#).

Note

For Spot Fleet, you can't specify a network interface ID in a launch template or launch specification. Make sure you omit the NetworkInterfaceID parameter in your launch template or launch specification.

Examples

- [Example 1: Launch Spot Instances using the lowest-priced Availability Zone or subnet in the Region](#)

- [Example 2: Launch Spot Instances using the lowest-priced Availability Zone or subnet in a specified list](#)
- [Example 3: Launch Spot Instances using the lowest-priced instance type in a specified list](#)
- [Example 4. Override the price for the request](#)
- [Example 5: Launch a Spot Fleet using the diversified allocation strategy](#)
- [Example 6: Launch a Spot Fleet using instance weighting](#)
- [Example 7: Launch a Spot Fleet with On-Demand capacity](#)
- [Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances](#)
- [Example 9: Launch Spot Instances in a capacity-optimized fleet](#)
- [Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities](#)
- [Example 11: Launch Spot Instances in a priceCapacityOptimized fleet](#)
- [Example 12: Configure attribute-based instance type selection](#)

Example 1: Launch Spot Instances using the lowest-priced Availability Zone or subnet in the Region

The following example specifies a single launch specification without an Availability Zone or subnet. The Spot Fleet launches the instances in the lowest-priced Availability Zone that has a default subnet. The price you pay does not exceed the On-Demand price.

```
{  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "KeyName": "my-key-pair",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "m3.medium",  
            "IamInstanceProfile": {  
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"  
            }  
        }  
    ]  
}
```

```
]  
}
```

Example 2: Launch Spot Instances using the lowest-priced Availability Zone or subnet in a specified list

The following examples specify two launch specifications with different Availability Zones or subnets, but the same instance type and AMI.

Availability Zones

The Spot Fleet launches the instances in the default subnet of the lowest-priced Availability Zone that you specified.

```
{  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "KeyName": "my-key-pair",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "m3.medium",  
            "Placement": {  
                "AvailabilityZone": "us-west-2a, us-west-2b"  
            },  
            "IamInstanceProfile": {  
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"  
            }  
        }  
    ]  
}
```

Subnets

You can specify default subnets or nondefault subnets, and the nondefault subnets can be from a default VPC or a nondefault VPC. The Spot service launches the instances in whichever subnet is in the lowest-priced Availability Zone.

You can't specify different subnets from the same Availability Zone in a Spot Fleet request.

```
{  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "KeyName": "my-key-pair",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "m3.medium",  
            "SubnetId": "subnet-a61dafcf, subnet-65ea5f08",  
            "IamInstanceProfile": {  
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"  
            }  
        }  
    ]  
}
```

If the instances are launched in a default VPC, they receive a public IPv4 address by default. If the instances are launched in a nondefault VPC, they do not receive a public IPv4 address by default. Use a network interface in the launch specification to assign a public IPv4 address to instances launched in a nondefault VPC. When you specify a network interface, you must include the subnet ID and security group ID using the network interface.

```
...  
{  
    "ImageId": "ami-1a2b3c4d",  
    "KeyName": "my-key-pair",  
    "InstanceType": "m3.medium",  
    "NetworkInterfaces": [  
        {  
            "DeviceIndex": 0,  
            "SubnetId": "subnet-1a2b3c4d",  
            "Groups": [ "sg-1a2b3c4d" ],  
            "AssociatePublicIpAddress": true  
        }  
    ],
```

```
"IamInstanceProfile": {  
    "Arn": "arn:aws:iam::880185128111:instance-profile/my-iam-role"  
}  
}  
...  
}
```

Example 3: Launch Spot Instances using the lowest-priced instance type in a specified list

The following examples specify two launch configurations with different instance types, but the same AMI and Availability Zone or subnet. The Spot Fleet launches the instances using the specified instance type with the lowest price.

Availability Zone

```
{  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "c5.4xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            }  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "r3.8xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            }  
        }  
    ]  
}
```

```
]  
}
```

Subnet

```
{  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "c5.4xlarge",  
            "SubnetId": "subnet-1a2b3c4d"  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "r3.8xlarge",  
            "SubnetId": "subnet-1a2b3c4d"  
        }  
    ]  
}
```

Example 4. Override the price for the request

We recommend that you use the default maximum price, which is the On-Demand price. If you prefer, you can specify a maximum price for the fleet request and maximum prices for individual launch specifications.

The following examples specify a maximum price for the fleet request and maximum prices for two of the three launch specifications. The maximum price for the fleet request is used for any launch specification that does not specify a maximum price. The Spot Fleet launches the instances using the instance type with the lowest price.

Availability Zone

```
{  
    "SpotPrice": "1.00",  
    "TargetCapacity": 30,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            },  
            "SpotPrice": "0.10"  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.4xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            },  
            "SpotPrice": "0.20"  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.8xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            }  
        }  
    ]  
}
```

Subnet

```
{  
    "SpotPrice": "1.00",  
    "TargetCapacity": 30,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            }  
        }  
    ]  
}
```

```
        "SubnetId": "subnet-1a2b3c4d",
        "SpotPrice": "0.10"
    },
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "c3.4xlarge",
        "SubnetId": "subnet-1a2b3c4d",
        "SpotPrice": "0.20"
    },
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "c3.8xlarge",
        "SubnetId": "subnet-1a2b3c4d"
    }
]
}
```

Example 5: Launch a Spot Fleet using the diversified allocation strategy

The following example uses the diversified allocation strategy. The launch specifications have different instance types but the same AMI and Availability Zone or subnet. The Spot Fleet distributes the 30 instances across the three launch specifications, such that there are 10 instances of each type. For more information, see [Allocation strategies for Spot Instances](#).

Availability Zone

```
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c4.2xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2b"
            }
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "Placement": {

```

```
        "AvailabilityZone": "us-west-2b"
    }
},
{
    "ImageId": "ami-1a2b3c4d",
    "InstanceType": "r3.2xlarge",
    "Placement": {
        "AvailabilityZone": "us-west-2b"
    }
}
]
```

Subnet

```
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c4.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        }
    ]
}
```

A best practice to increase the chance that a spot request can be fulfilled by EC2 capacity in the event of an outage in one of the Availability Zones is to diversify across zones. For this scenario,

include each Availability Zone available to you in the launch specification. And, instead of using the same subnet each time, use three unique subnets (each mapping to a different zone).

Availability Zone

```
{  
    "SpotPrice": "0.70",  
    "TargetCapacity": 30,  
    "AllocationStrategy": "diversified",  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c4.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2a"  
            }  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "m3.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            }  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2c"  
            }  
        }  
    ]  
}
```

Subnet

```
{  
    "SpotPrice": "0.70",  
    "TargetCapacity": 30,  
    "AllocationStrategy": "diversified",  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c4.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2a"  
            }  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "m3.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            }  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2c"  
            }  
        }  
    ]  
}
```

```
{  
    "ImageId": "ami-1a2b3c4d",  
    "InstanceType": "c4.2xlarge",  
    "SubnetId": "subnet-1a2b3c4d"  
},  
{  
    "ImageId": "ami-1a2b3c4d",  
    "InstanceType": "m3.2xlarge",  
    "SubnetId": "subnet-2a2b3c4d"  
},  
{  
    "ImageId": "ami-1a2b3c4d",  
    "InstanceType": "r3.2xlarge",  
    "SubnetId": "subnet-3a2b3c4d"  
}  
]  
}
```

Example 6: Launch a Spot Fleet using instance weighting

The following examples use instance weighting, which means that the price is per unit hour instead of per instance hour. Each launch configuration lists a different instance type and a different weight. The Spot Fleet selects the instance type with the lowest price per unit hour. The Spot Fleet calculates the number of Spot Instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the Spot Fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity.

If the `r3.2xlarge` request is successful, Spot provisions 4 of these instances. Divide 20 by 6 for a total of 3.33 instances, then round up to 4 instances.

If the `c3.xlarge` request is successful, Spot provisions 7 of these instances. Divide 20 by 3 for a total of 6.66 instances, then round up to 7 instances.

For more information, see [Spot Fleet instance weighting](#).

Availability Zone

```
{  
    "SpotPrice": "0.70",  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
```

```
"LaunchSpecifications": [
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "r3.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        },
        "WeightedCapacity": 6
    },
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "c3.xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        },
        "WeightedCapacity": 3
    }
]
```

Subnet

```
{
    "SpotPrice": "0.70",
    "TargetCapacity": 20,
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d",
            "WeightedCapacity": 6
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c3.xlarge",
            "SubnetId": "subnet-1a2b3c4d",
            "WeightedCapacity": 3
        }
    ]
}
```

Example 7: Launch a Spot Fleet with On-Demand capacity

To ensure that you always have instance capacity, you can include a request for On-Demand capacity in your Spot Fleet request. If there is capacity, the On-Demand request is always fulfilled. The balance of the target capacity is fulfilled as Spot if there is capacity and availability.

The following example specifies the desired target capacity as 10, of which 5 must be On-Demand capacity. Spot capacity is not specified; it is implied in the balance of the target capacity minus the On-Demand capacity. Amazon EC2 launches 5 capacity units as On-Demand, and 5 capacity units ($10-5=5$) as Spot if there is available Amazon EC2 capacity and availability.

For more information, see [On-Demand in Spot Fleet](#).

```
{  
    "IamFleetRole": "arn:aws:iam::781603563322:role/aws-ec2-spot-fleet-tagging-role",  
    "AllocationStrategy": "lowestPrice",  
    "TargetCapacity": 10,  
    "SpotPrice": null,  
    "ValidFrom": "2018-04-04T15:58:13Z",  
    "ValidUntil": "2019-04-04T15:58:13Z",  
    "TerminateInstancesWithExpiration": true,  
    "LaunchSpecifications": [],  
    "Type": "maintain",  
    "OnDemandTargetCapacity": 5,  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0dbb04d4a6cca5ad1",  
                "Version": "2"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "t2.medium",  
                    "WeightedCapacity": 1,  
                    "SubnetId": "subnet-d0dc51fb"  
                }  
            ]  
        }  
    ]  
}
```

Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances

The following example configures the Spot Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation for a Spot Instance in the fleet. To configure the automatic replacement of Spot Instances, for `ReplacementStrategy`, specify `launch-before-terminate`. To configure the time delay from the launch of the new replacement Spot Instances to the automatic deletion of the old Spot Instances, for `termination-delay`, specify a value in seconds. For more information, see [Configuration options](#).

Note

We recommend using `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete. This ensures that the old instances are terminated only after the shutdown procedures are completed. You are charged for all instances while they are running.

The effectiveness of the Capacity Rebalancing strategy depends on the number of Spot capacity pools specified in the Spot Fleet request. We recommend that you configure the fleet with a diversified set of instance types and Availability Zones, and for `AllocationStrategy`, specify `capacityOptimized`. For more information about what you should consider when configuring a Spot Fleet for Capacity Rebalancing, see [Capacity Rebalancing](#).

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "capacityOptimized",  
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-  
role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "LaunchTemplate",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceType": "c3.large",  
                        "WeightedCapacity": 1,  
                        "Placement": {  
                            "AvailabilityZone": "us-east-1a"  
                        }  
                    }  
                ]  
            }  
        ]  
    }  
}
```

```
        }
    },
    {
        "InstanceType": "c4.large",
        "WeightedCapacity": 1,
        "Placement": {
            "AvailabilityZone": "us-east-1a"
        }
    },
    {
        "InstanceType": "c5.large",
        "WeightedCapacity": 1,
        "Placement": {
            "AvailabilityZone": "us-east-1a"
        }
    }
]
},
{
    "TargetCapacity": 5,
    "SpotMaintenanceStrategies": {
        "CapacityRebalance": {
            "ReplacementStrategy": "launch-before-terminate",
            "TerminationDelay": "720"
        }
    }
}
}
```

Example 9: Launch Spot Instances in a capacity-optimized fleet

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for capacity. To optimize for capacity, you must set AllocationStrategy to capacityOptimized.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

```
{
    "TargetCapacity": "50",
    "SpotFleetRequestConfig": {
```

```
    "AllocationStrategy": "capacityOptimized",
},
"LaunchTemplateConfigs": [
{
    "LaunchTemplateSpecification": {
        "LaunchTemplateName": "my-launch-template",
        "Version": "1"
    },
    "Overrides": [
        {
            "InstanceType": "r4.2xlarge",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceType": "m4.2xlarge",
            "AvailabilityZone": "us-west-2b"
        },
        {
            "InstanceType": "c5.2xlarge",
            "AvailabilityZone": "us-west-2b"
        }
    ]
}
]
```

Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for capacity while using priority on a best-effort basis.

When using the `capacityOptimizedPrioritized` allocation strategy, you can use the `Priority` parameter to specify the priorities of the Spot capacity pools, where the lower the number the higher priority. You can also set the same priority for several Spot capacity pools if you favor them equally. If you do not set a priority for a pool, the pool will be considered last in terms of priority.

To prioritize Spot capacity pools, you must set `AllocationStrategy` to `capacityOptimizedPrioritized`. Spot Fleet will optimize for capacity first, but will honor the priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect Spot Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters.

In the following example, the three launch specifications specify three Spot capacity pools. Each pool is prioritized, where the lower the number the higher priority. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with the highest priority on a best-effort basis, but optimizes for capacity first.

```
{  
    "TargetCapacity": "50",  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "capacityOptimizedPrioritized"  
    },  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "my-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "r4.2xlarge",  
                    "Priority                    "AvailabilityZone": "us-west-2a"  
                },  
                {  
                    "InstanceType": "m4.2xlarge",  
                    "Priority                    "AvailabilityZone": "us-west-2b"  
                },  
                {  
                    "InstanceType": "c5.2xlarge",  
                    "Priority                    "AvailabilityZone": "us-west-2b"  
                }  
            ]  
        }  
    ]  
}
```

Example 11: Launch Spot Instances in a priceCapacityOptimized fleet

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for both capacity and lowest price. To optimize for capacity while taking price into consideration, you must set the Spot AllocationStrategy to priceCapacityOptimized.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching while also choosing the pool that is the lowest priced.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "priceCapacityOptimized",  
        "OnDemandAllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::111111111111:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateId": "lt-0123456789example",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceType": "r4.2xlarge",  
                        "AvailabilityZone": "us-west-2a"  
                    },  
                    {  
                        "InstanceType": "m4.2xlarge",  
                        "AvailabilityZone": "us-west-2b"  
                    },  
                    {  
                        "InstanceType": "c5.2xlarge",  
                        "AvailabilityZone": "us-west-2b"  
                    }  
                ]  
            }  
        ],  
        "TargetCapacity": 50,  
        "Type": "request"  
    }  
}
```

Example 12: Configure attribute-based instance type selection

The following example demonstrates how to configure a Spot Fleet to use attribute-based instance type selection for identifying instance types. To specify the required instance attributes, you specify the attributes in the `InstanceRequirements` structure.

In the following example, two instance attributes are specified:

- `VCpuCount` – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- `MemoryMiB` – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when [Spot Fleet provisions the fleet](#).

For a list and descriptions of all the possible attributes that you can specify, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

```
{  
    "AllocationStrategy": "priceCapacityOptimized",  
    "TargetCapacity": 20,  
    "Type": "request",  
    "LaunchTemplateConfigs": [  
        {"LaunchTemplateSpecification": {  
            "LaunchTemplateName": "my-launch-template",  
            "Version": "1"  
        },  
        "Overrides": [  
            {"InstanceRequirements": {  
                "VCpuCount": {  
                    "Min": 2  
                },  
                "MemoryMiB": {  
                    "Min": 4  
                }  
            }  
        ]  
    ]  
}
```

Fleet quotas

The usual Amazon EC2 quotas (formerly referred to as limits) apply to instances launched by an EC2 Fleet or a Spot Fleet, such as [Spot Instance limits](#) and [volume limits](#).

In addition, the following quotas apply:

Quota description	Quota
The number of EC2 Fleets and Spot Fleets per Region in the active, deleted_running , and cancelled_running states	1,000 ^{1 2 3 4}
The number of Spot capacity pools (unique combination of instance type and subnet)	300 ^{1 4}
The size of the user data in a launch specification	16 KB ²
The target capacity per EC2 Fleet or Spot Fleet	10,000
The target capacity across all EC2 Fleets and Spot Fleets in a Region	100,000 ¹
An EC2 Fleet request or a Spot Fleet request can't span Regions.	
An EC2 Fleet request or a Spot Fleet request can't span different subnets from the same Availability Zone.	

¹ These quotas apply to both your EC2 Fleets and your Spot Fleets.

² These are hard quotas. You cannot request an increase for these quotas.

³ After you delete an EC2 Fleet or cancel a Spot Fleet request, and if you specified that the fleet should *not* terminate its Spot Instances when you deleted or canceled the request, the fleet request enters the deleted_running (EC2 Fleet) or cancelled_running (Spot Fleet) state and the instances continue to run until they are interrupted or you terminate them manually. If

you terminate the instances, the fleet request enters the deleted_terminating (EC2 Fleet) or cancelled_terminating (Spot Fleet) state and does not count towards this quota. For more information, see [Delete an EC2 Fleet](#) and [Cancel a Spot Fleet request](#).

⁴ This quota only applies to fleets of type request or maintain. This quota does not apply to instant fleets.

Request a quota increase for target capacity

If you need more than the default quota for target capacity, you can request a quota increase.

To request a quota increase for target capacity

1. Open the AWS Support Center [Create case form](#).
2. Choose **Service limit increase**.
3. For **Limit type**, choose **EC2 Fleet**.
4. For **Region**, choose the AWS Region in which to request the quota increase.
5. For **Limit**, choose **Target Fleet Capacity per Fleet (in units)** or **Target Fleet Capacity per Region (in units)**, depending on which quota you want to increase.
6. For **New limit value**, enter the new quota value.
7. To request an increase for another quota, choose **Add another request**, and repeat Steps 4–6.
8. For **Use case description**, enter your reason for requesting a quota increase.
9. Under **Contact options**, specify your preferred contact language and contact method.
10. Choose **Submit**.

Amazon Elastic Graphics

Important

Amazon Elastic Graphics reached end of life on January 8, 2024. For workloads that require graphics acceleration, we recommend that you use Amazon EC2 G4ad, G4dn, or G5 instances.

Amazon Elastic Graphics provides flexible, low-cost, and high performance graphics acceleration for your Windows instances. Elastic Graphics accelerators come in multiple sizes and are a low-cost alternative to using GPU graphics instance types (such as G3). You have the flexibility to choose an instance type that meets the compute, memory, and storage needs of your application. Then, choose the accelerator for your instance that meets the graphics requirements of your workload.

Elastic Graphics is suited for applications that require a small or intermittent amount of additional graphics acceleration, and that use OpenGL graphics support. If you need access to full, directly attached GPUs and use of DirectX, CUDA, or Open Computing Language (OpenCL) parallel computing frameworks, use an accelerated computing instance type instance instead.

Contents

- [Elastic Graphics basics](#)
- [Pricing for Elastic Graphics](#)
- [Elastic Graphics limitations](#)
- [Work with Elastic Graphics](#)
- [Elastic Graphics maintenance](#)
- [Use CloudWatch metrics to monitor Elastic Graphics](#)
- [Troubleshoot](#)

Elastic Graphics basics

To use Elastic Graphics, launch a Windows instance and specify an accelerator type for the instance during launch. AWS finds available Elastic Graphics capacity and establishes a network connection between your instance and the Elastic Graphics accelerator.

Note

Bare metal instances are not supported.

Elastic Graphics accelerators are available in the following AWS Regions: us-east-1, us-east-2, us-west-2, ap-northeast-1, ap-southeast-1, ap-southeast-2, eu-central-1, and eu-west-1.

The following instance types support Elastic Graphics accelerators:

- **General purpose:** M3, M4, M5, M5d, M5dn, M5n, T2, T3

Note

Only t2.medium and larger and t3.medium and larger are supported.

- **Compute optimized:** C3, C4, C5, C5a, C5ad, C5d, C5n
- **Memory optimized:** R3, R4, R5, R5d, R5dn, R5n, X1, X1e, z1d
- **Storage optimized:** D2, D3, D3en, H1, I3, I3en
- **Accelerated computing:** P2, P3, P3dn

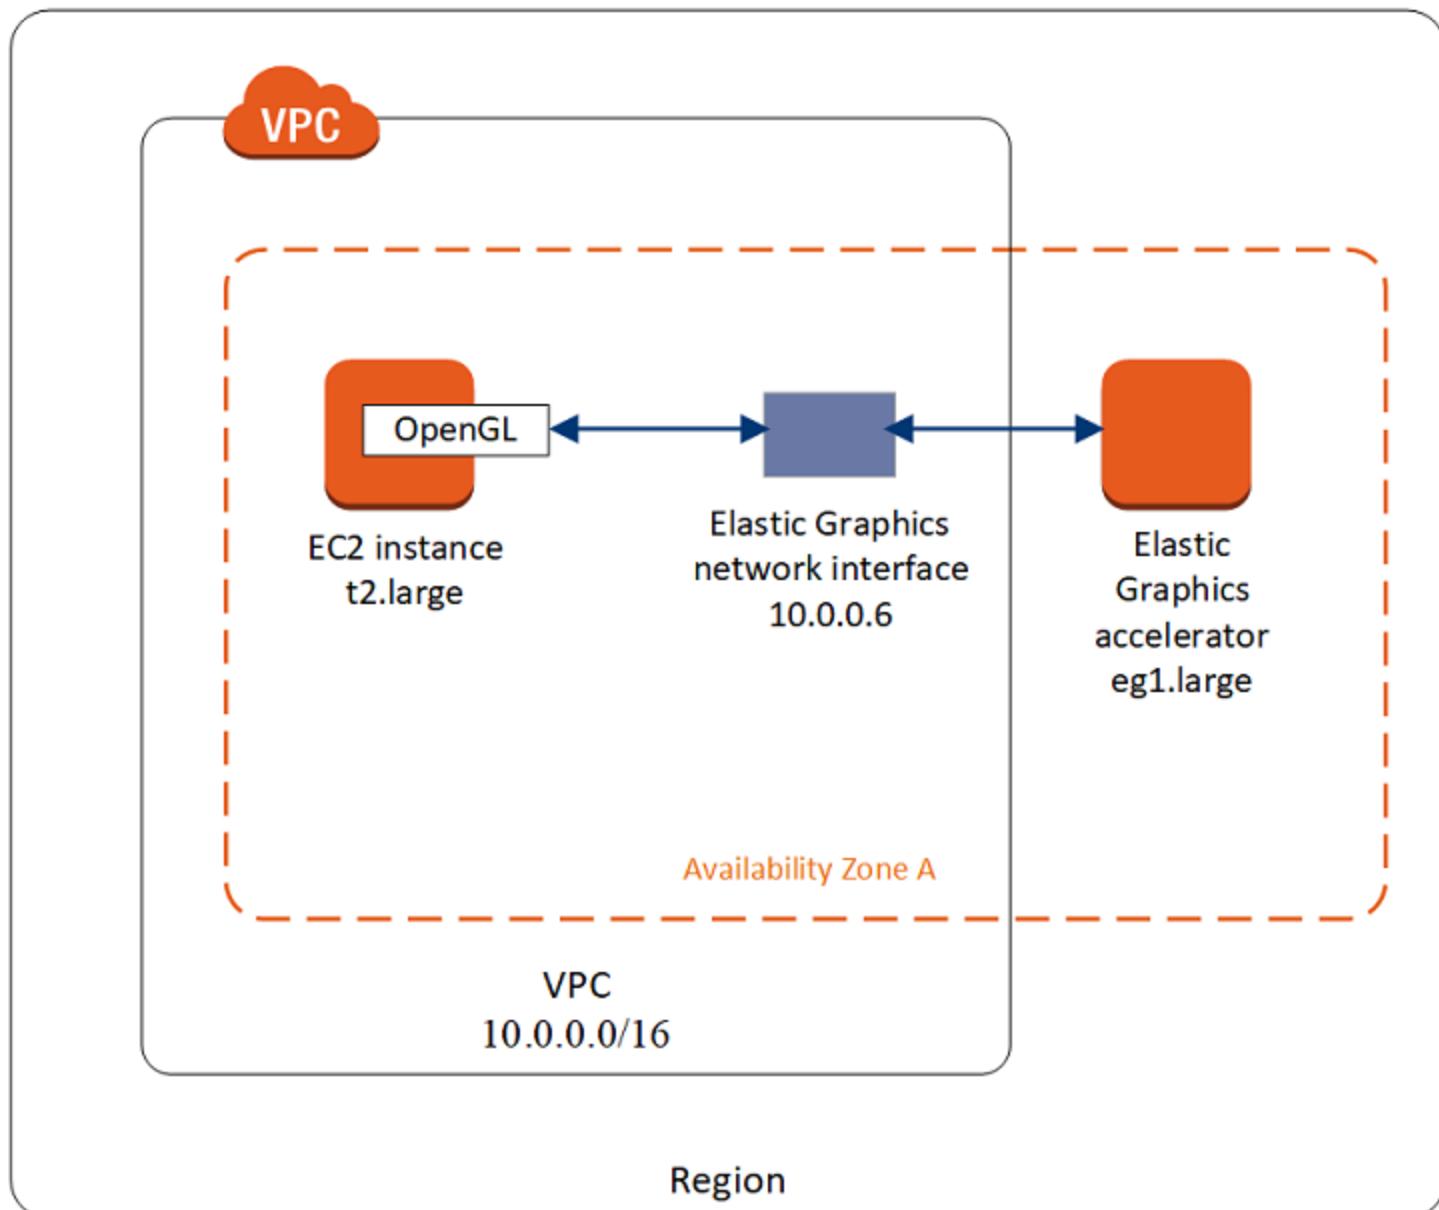

The following Elastic Graphics accelerators are available. You can attach any Elastic Graphics accelerator to any supported instance type.

Elastic Graphics accelerator	Graphics memory (GB)
eg1.medium	1
eg1.large	2
eg1.xlarge	4
eg1.2xlarge	8

An Elastic Graphics accelerator does not form part of the hardware of your instance. Instead, it is network-attached through a network interface, known as the *Elastic Graphics network interface*.

When you launch or restart an instance with graphics acceleration, the Elastic Graphics network interface is created in your VPC for you.

The Elastic Graphics network interface is created in the same subnet and VPC as your instance and is assigned a private IPv4 address from that subnet. The accelerator attached to your Amazon EC2 instance is allocated from a pool of available accelerators in the same Availability Zone as your instance.

Elastic Graphics accelerators support the API standards for OpenGL 4.3 API and earlier, which can be used for batch applications or 3D-graphics acceleration. An Amazon-optimized OpenGL library

on your instance detects the attached accelerator. It directs OpenGL API calls from your instance to the accelerator, which then processes the requests and returns the results. Traffic between the instance and the accelerator uses the same bandwidth as the instance's network traffic so we recommend that you have adequate network bandwidth available. Consult your software vendor for any OpenGL compliance and version questions.

By default, the default security group for your VPC is associated with the Elastic Graphics network interface. The Elastic Graphics network traffic uses the TCP protocol and port 2007. Ensure that the security group for your instance allows for this. For more information, see [Configure your security groups](#).

Pricing for Elastic Graphics

You are charged for each second that an Elastic Graphics accelerator is attached to an instance in the running state when the accelerator is in the Ok state. You are not charged for an accelerator attached to an instance that is in the pending, stopping, stopped, shutting-down, or terminated state. You are also not charged when an accelerator is in the Unknown or Impaired state.

Pricing for accelerators is available at On-Demand rates only. You can attach an accelerator to a Reserved Instance or Spot Instance, however, the On-Demand price for the accelerator applies.

For more information, see [Amazon Elastic Graphics Pricing](#).

Elastic Graphics limitations

Before you start using Elastic Graphics accelerators, be aware of the following limitations:

- You can attach accelerators only to Windows instances with Microsoft Windows Server 2012 R2 or later. Linux instances are currently not supported.
- You can attach one accelerator to an instance at a time.
- You can attach an accelerator only during instance launch. You cannot attach an accelerator to an existing instance.
- You can't hibernate an instance with an attached accelerator.
- You can't share an accelerator between instances.
- You can't detach an accelerator from an instance or transfer it to another instance. If you no longer require an accelerator, you must terminate your instance. To change the accelerator type,

create an AMI from your instance, terminate the instance, and launch a new instance with a different accelerator specification.

- The only supported versions of the OpenGL API are 4.3 and earlier. DirectX, CUDA, and OpenCL are not supported.
- The Elastic Graphics accelerator is not visible or accessible through the device manager of your instance.
- You can't reserve or schedule accelerator capacity.

Work with Elastic Graphics

Important

Amazon Elastic Graphics reached end of life on January 8, 2024. For workloads that require graphics acceleration, we recommend that you use Amazon EC2 G4ad, G4dn, or G5 instances.

You can launch an instance and associate it with an Elastic Graphics accelerator during launch. You must then manually install the necessary libraries on your instance that enable communication with the accelerator. For limitations, see [Elastic Graphics limitations](#).

Tasks

- [Configure your security groups](#)
- [Launch an instance with an Elastic Graphics accelerator](#)
- [Install the required software for Elastic Graphics](#)
- [Verify Elastic Graphics functionality on your instance](#)
- [View Elastic Graphics information](#)
- [Submit feedback](#)

Configure your security groups

Elastic Graphics requires a self-referencing security group that allows inbound and outbound traffic to and from the security group itself. The security group must include the following inbound and outbound rules.

Inbound

Type	Protocol	Port	Source
Elastic Graphics	TCP	2007	The security group ID (its own resource ID)

Outbound

Type	Protocol	Port range	Destination
Elastic Graphics	TCP	2007	The security group ID (its own resource ID)

If you use the Amazon EC2 console to launch your instance with an Elastic Graphics accelerator, you can either allow the launch instance wizard to automatically create the required security group rules, or you can select a security that you created previously.

If you are launching your instance using the AWS CLI or an SDK, you must specify a security group that you created previously.

To create a security group for Elastic Graphics

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups** and then choose **Create security group**.
3. In the **Create security group** window, do the following:
 - a. For **Security group name**, enter a descriptive name for the security group, such as **Elastic Graphics security group**.
 - b. (Optional) For **Description**, enter a brief description of the security group.
 - c. For **VPC**, select the VPC into which you intend to use Elastic Graphics.
 - d. Choose **Create security group**.
4. In the navigation pane, choose **Security Groups**, select the security group that you just created, and on the **Details** tab, copy the **Security group ID**.
5. On the **Inbound rules** tab, choose **Edit inbound rules** and then do the following:
 - a. Choose **Add rule**.

- b. For **Type**, choose **Elastic Graphics**.
 - c. For **Source type**, choose **Custom**.
 - d. For **Source**, paste the security group ID that you copied previously.
 - e. Choose **Save rules**.
6. On the **Outbound rules** tab, choose **Edit outbound rules** and then do the following:
- a. Choose **Add rule**.
 - b. For **Type**, choose **Elastic Graphics**.
 - c. For **Destination type**, choose **Custom**.
 - d. For **Destination**, paste the security group ID that you copied previously.
 - e. Choose **Save rules**.

For more information, see [Amazon EC2 security groups for Windows instances](#).

Launch an instance with an Elastic Graphics accelerator

You can associate an Elastic Graphics accelerator to an instance during launch. If the launch fails, the following are possible reasons:

- Insufficient Elastic Graphics accelerator capacity
- Exceeded limit on Elastic Graphics accelerators in the Region
- Not enough private IPv4 addresses in your VPC to create a network interface for the accelerator

For more information, see [Elastic Graphics limitations](#).

To associate an Elastic Graphics accelerator during instance launch (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the dashboard, choose **Launch Instance**.
3. Select a Windows AMI and a supported instance type. For more information, see [Elastic Graphics basics](#).
4. On the **Configure Instance Details** page, select a VPC and subnet in which to launch your instance.
5. Choose **Add Graphics Acceleration**, and select an Elastic Graphics accelerator type.

6. (Optional) On the **Add Storage** and **Add Tags** pages, add volumes and tags as needed.
7. On the **Configure Security Group** page, you can let the console create a security group for you with the required inbound and outbound rules, or you can use the security group that you created manually in [Configure your security groups](#). Add additional security groups as needed.
8. Choose **Review and Launch** to review your instance options and then choose **Launch**.

To associate an Elastic Graphics accelerator during instance launch (AWS CLI)

You can use the [run-instances](#) AWS CLI command with the following parameter:

```
--elastic-gpu-specification Type=eg1.medium
```

For the --security-group-ids parameter, you must include a security group that has the required inbound and outbound rules. For more information, see [Configure your security groups](#).

To associate an Elastic Graphics accelerator during instance launch (Tools for Windows PowerShell)

Use the [New-EC2Instance](#) Tools for Windows PowerShell command.

Install the required software for Elastic Graphics

If you launched your instance using a current AWS Windows AMI, the required software is installed automatically during the first boot. If you launched your instance using Windows AMIs that do not automatically install the required software, you must install the required software on the instance manually.

To install the required software for Elastic Graphics (if necessary)

1. Connect to the instance.
2. Download the [Elastic Graphics installer](#) and open it. The installation manager connects to the Elastic Graphics endpoint and downloads the latest version of the required software.

Note

If the download link does not work, try a different browser, or copy the link address and paste it into a new browser tab.

3. Reboot the instance to verify.

Verify Elastic Graphics functionality on your instance

The Elastic Graphics packages on your instance include tools that you can use to view the status of the accelerator, and to verify that OpenGL commands from your instance to the accelerator are functional.

If your instance was launched with an AMI that does not have the Elastic Graphics packages pre-installed, you can download and install them yourself. For more information, see [Install the required software for Elastic Graphics](#).

You can use one of the following methods to verify Elastic Graphics functionality on your instance.

 **Note**

If the Elastic Graphics status monitor or command line tool returns an unexpected result, see [Resolve unhealthy status issues](#).

Elastic Graphics status monitor

You can use the status monitor tool to view information about the status of an attached Elastic Graphics accelerator. By default, this tool is available in the notification area of the taskbar in your Windows instance and shows the status of the graphics accelerator. The following are the possible values.

Healthy

The Elastic Graphics accelerator is enabled and healthy.

Updating

The status of the Elastic Graphics accelerator is currently updating. It might take a few minutes to display the status.

Out of service

The Elastic Graphics accelerator is out of service. To get more information about the error, choose **Read More**.

Elastic Graphics command line tool

You can use the Elastic Graphics command line tool, `egcli.exe`, to check the status of the accelerator. If there is a problem with the accelerator, the tool returns an error message.

To launch the tool, open a command prompt from within your instance and run the following command:

```
C:\Program Files\Amazon\EC2ElasticGPUs\manager\egcli.exe
```

The tool also supports the following parameters:

`--json, -j`

Indicates whether to show the JSON message. The possible values are `true` and `false`. The default is `true`.

`--imds, -i`

Indicates whether to check the instance metadata for the availability of the accelerator. The possible values are `true` and `false`. The default is `true`.

The following is example output. A status of `OK` indicates that the accelerator is enabled and healthy.

```
EG Infrastructure is available.  
Instance ID egpu-f6d94dfa66df4883b284e96db7397ee6  
Instance Type eg1.large  
EG Version 1.0.0.885 (Manager) / 1.0.0.95 (OpenGL Library) / 1.0.0.69 (OpenGL  
Redirector)  
EG Status: Healthy  
JSON Message:  
{  
    "version": "2016-11-30",  
    "status": "OK"  
}
```

The following are the possible values for `status`:

`OK`

The Elastic Graphics accelerator is enabled and healthy.

UPDATING

The Elastic Graphics driver is being updated.

NEEDS_REBOOT

The Elastic Graphics driver has been updated and a reboot of the Amazon EC2 instance is required.

LOADING_DRIVER

The Elastic Graphics driver is being loaded.

CONNECTING_EGPU

The Elastic Graphics driver is verifying the connectivity with the Elastic Graphics accelerator.

ERROR_UPDATE_RETRY

An error occurred while updating the Elastic Graphics driver, an update will be retried soon.

ERROR_UPDATE

An unrecoverable error occurred while updating the Elastic Graphics driver.

ERROR_LOAD_DRIVER

An error occurred loading the Elastic Graphics driver.

ERROR_EGPU_CONNECTIVITY

The Elastic Graphics accelerator is unreachable.

View Elastic Graphics information

You can view information about the Elastic Graphics accelerator attached to your instance.

To view information about an Elastic Graphics accelerator (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select your instance.
3. On the **Details** tab, find **Elastic Graphics ID**. Choose the ID to view the following information about the Elastic Graphics accelerator:

- Attachment State
- Type
- Health status

To view information about an Elastic Graphics accelerator (AWS CLI)

You can use the [describe-elastic-gpus](#) AWS CLI command:

```
aws ec2 describe-elastic-gpus
```

You can use the [describe-network-interfaces](#) AWS CLI command and filter by owner ID to view information about the Elastic Graphics network interface.

```
aws ec2 describe-network-interfaces --filters "Name=attachment.instance-owner-id,Values=amazon-elasticgpus"
```

To view information about an Elastic Graphics accelerator (Tools for Windows PowerShell)

Use the following commands:

- [Get-EC2ElasticGpu](#)
- [Get-EC2NetworkInterface](#)

To view information about an Elastic Graphics accelerator using instance metadata

1. Connect to your Windows instance that is using an Elastic Graphics accelerator.
2. Do one of the following:
 - From PowerShell, use the following cmdlet:

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/elastic-gpus/associations/egpu-f6d94dfa66df4883b284e96db7397ee6
```

- From your web browser, paste the following URL into the address field:

```
http://169.254.169.254/latest/meta-data/elastic-gpus/associations/egpu-f6d94dfa66df4883b284e96db7397ee6
```

Submit feedback

You can submit feedback about your experience with Elastic Graphics so that the team can make further improvements.

To submit feedback using the Elastic Graphics Status Monitor

1. In the notification area of the taskbar in your Windows instance, open the Elastic Graphics Status Monitor.
2. In the lower left corner, choose **Feedback**.
3. Enter your feedback and choose **Submit**.

Elastic Graphics maintenance

Important

Amazon Elastic Graphics reached end of life on January 8, 2024. For workloads that require graphics acceleration, we recommend that you use Amazon EC2 G4ad, G4dn, or G5 instances.

AWS might determine that an Elastic Graphics accelerator is in an *unhealthy* state if:

- A security or infrastructure update is needed
- A software update is needed
- There is an issue with the underlying host

When AWS determines that an Elastic Graphics accelerator is in an unhealthy state, it schedules the accelerator for retirement. AWS notifies you of the accelerator's pending retirement, and provides you with the remedial steps that you need to take.

Topics

- [How will I be notified?](#)
- [What do I need to do?](#)
- [What happens when an accelerator reaches its retirement date?](#)

How will I be notified?

When AWS schedules an Elastic Graphics accelerator for retirement, it sends an accelerator retirement notice to your [AWS Health Dashboard](#). AWS also sends an email to the email address that is associated with your AWS account. This is the same email address that you use to log in to the AWS Management Console.

 **Note**

If you use an email account that you don't check regularly, use the AWS Health Dashboard to determine if any of your Elastic Graphics accelerators are scheduled for retirement. You can also change the contact information for your AWS account on the [Account Settings](#) page.

The retirement notice provides the following:

- The ID of instance to which the accelerator is attached
- Information about the issue impacting the accelerator
- The retirement date for the accelerator
- The remedial steps that you should take

What do I need to do?

When you are notified that your Elastic Graphics accelerator is scheduled for retirement, you must [stop and start the instance](#) to which the accelerator is attached for the old, *unhealthy* accelerator to be replaced with a new, *healthy* accelerator.

We recommend that you close graphic applications running on the instance before you stop and restart the instance.

 **Important**

If you do not stop and start your instance before the scheduled retirement date, the accelerator associated with your instance is automatically stopped, which might cause your applications to stop working.

You must stop and start the instance. Rebooting the instance will not replace the unhealthy accelerator with a healthy one.

What happens when an accelerator reaches its retirement date?

When an unhealthy Elastic Graphics accelerator reaches its scheduled retirement date, AWS permanently terminates it. To receive a replacement for your unhealthy accelerator, either before or after the retirement date, you must stop and start the instance to which the accelerator is attached.

If you do not stop and start your instance before the scheduled retirement date, the accelerator associated with your instance is automatically stopped, which might cause your applications to stop working.

Use CloudWatch metrics to monitor Elastic Graphics

 **Important**

Amazon Elastic Graphics reached end of life on January 8, 2024. For workloads that require graphics acceleration, we recommend that you use Amazon EC2 G4ad, G4dn, or G5 instances.

You can monitor your Elastic Graphics accelerator using Amazon CloudWatch, which collects metrics about your accelerator performance. These statistics are recorded for a period of two weeks, so that you can access historical information and gain a better perspective on how your service is performing.

By default, Elastic Graphics accelerators send metric data to CloudWatch in 5-minute periods.

For more information about Amazon CloudWatch, see the [Amazon CloudWatch User Guide](#).

Elastic Graphics metrics

The AWS/ElasticGPUs namespace includes the following metrics for Elastic Graphics.

Metric	Description
GPUConnectivityCheckFailed	Reports whether connectivity to the Elastic Graphics accelerator is active or has failed. A value of zero (0) indicates that the connection is active. A value of one (1) indicates a connectivity failure. Units: Count
GPUHealthCheckFailed	Reports whether the Elastic Graphics accelerator has passed a status health check in the last minute. A value of zero (0) indicates that the status check passed. A value of one (1) indicates a status check failure. Units: Count
GPUMemoryUtilization	The GPU memory used. Units: MiB

Elastic Graphics dimensions

You can filter the metrics data for your Elastic Graphics accelerators using the following dimensions.

Dimension	Description
EGPUId	Filters the data by the Elastic Graphics accelerator.
InstanceId	Filters the data by the instance to which the Elastic Graphics accelerator is attached.

View CloudWatch metrics for Elastic Graphics

Metrics are grouped first by the service namespace, and then by the supported dimensions. You can use the following procedures to view the metrics for your Elastic Graphics accelerators.

To view Elastic Graphics metrics using the CloudWatch console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. If necessary, change the Region. From the navigation bar, select the Region where your Elastic Graphics accelerator resides. For more information, see [Regions and Endpoints](#).
3. In the navigation pane, choose **Metrics**.
4. For All metrics, select **Elastic Graphics, Elastic Graphics Metrics**.

To view Elastic Graphics metrics (AWS CLI)

Use the following [list-metrics](#) command:

```
aws cloudwatch list-metrics --namespace "AWS/ElasticGPUs"
```

Create CloudWatch alarms to monitor Elastic Graphics

You can create a CloudWatch alarm that sends an Amazon SNS message when the alarm changes state. An alarm watches a single metric over a time period you specify, and sends a notification to an Amazon SNS topic based on the value of the metric relative to a given threshold over a number of time periods.

For example, you can create an alarm that monitors the health of an Elastic Graphics accelerator and sends a notification when the graphics accelerator fails a status health check for three consecutive 5-minute periods.

To create an alarm for an Elastic Graphics accelerator health status

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms, Create Alarm**.
3. Choose **Select metric, Elastic Graphics, Elastic Graphics Metrics**.
4. Select the **GPUHealthCheckFailed** metric and choose **Select metric**.
5. Configure the alarm as follows:
 - a. For **Alarm details**, type a name and description for your alarm. For **Whenever**, choose **>=** and type 1.
 - b. For **Actions**, select an existing notification list or choose **New list**.
 - c. Choose **Create Alarm**.

Troubleshoot

Important

Amazon Elastic Graphics reached end of life on January 8, 2024. For workloads that require graphics acceleration, we recommend that you use Amazon EC2 G4ad, G4dn, or G5 instances.

The following are common errors and troubleshooting steps.

Contents

- [Investigate application performance issues](#)
 - [OpenGL rendering performance issues](#)
 - [Remote access performance issues](#)
- [Resolve unhealthy status issues](#)
 - [Check the instance configuration](#)
 - [Stop and start the instance](#)
 - [Verify the installed components](#)
 - [Check the Elastic Graphics logs](#)
- [Why am I seeing multiple ENIs?](#)

Investigate application performance issues

Elastic Graphics uses the instance network to send OpenGL commands to a remotely attached graphics card. In addition, a desktop running an OpenGL application with an Elastic Graphics accelerator is usually accessed using a remote access technology. It is important to distinguish between a performance problem related to the OpenGL rendering or the desktop remote access technology.

OpenGL rendering performance issues

The OpenGL rendering performance is determined by the number of OpenGL commands and frames generated on the remote instance.

Rendering performance may vary depending on the following factors:

- Elastic Graphics accelerator performance
- Network performance
- CPU performance
- Rendering model, scenario complexity
- OpenGL application behavior

An easy way to evaluate performance is to display the number of rendered frames on the remote instance. Elastic Graphics accelerators display a maximum of 25 FPS on the remote instance to achieve the best perceived quality while reducing network usage.

To show the number of frames produced

1. Open the following file in a text editor. If the file does not exist, create it.

```
C:\Program Files\Amazon\EC2ElasticGPUs\conf\eg.conf
```

2. Identify the [Application] section, or add it if it is not present, and add the following configuration parameter:

```
[Application]
show_fps=1
```

3. Restart the application and check the FPS again.

If the FPS reaches 15-25 FPS when updating the rendered scene, then the Elastic Graphics accelerator is performing at peak. Any other performance problems you experience are likely related to the remote access to the instance desktop. If that is the case, see the Remote Access Performance Issues section.

If the FPS number is lower than 15, you can try the following:

- Improve Elastic Graphics accelerator performance by selecting a more powerful graphics accelerator type.
- Improve overall network performance by using these tips:
 - Check the amount of incoming and outgoing bandwidth to and from the Elastic Graphics accelerator endpoint. The Elastic Graphics accelerator endpoint can be retrieved with the following PowerShell command:

```
PS C:\> (Invoke-WebRequest http://169.254.169.254/latest/meta-data/elastic-gpus/associations/[ELASTICGPU_ID]).content
```

- The network traffic from the instance to the Elastic Graphics accelerator endpoint relates to the volume of commands the OpenGL application is producing.
- The network traffic from the Elastic Graphics accelerator endpoint to the instance relates to the number of frames generated by the graphics accelerator.
- If you see the network usage reaching the instances maximum network throughput, try using an instance with a higher network throughput allowance.
- Improve CPU performance:
 - Applications may require a lot of CPU resources in addition to what the Elastic Graphics accelerator requires. If Windows Task Manager is reporting a high usage of CPU resources, try using an instance with more CPU power.

Remote access performance issues

An instance with an attached Elastic Graphics accelerator can be accessed using different remote access technologies. Performance and quality may vary depending on:

- The remote access technology
- Instance performance
- Client performance
- Network latency and bandwidth between the client and the instance

Possible choices for the remote access protocol include:

- Microsoft Remote Desktop Connection
- NICE DCV
- VNC

For more information about optimization, see the specific protocol.

Resolve unhealthy status issues

If the Elastic Graphics accelerator is in an unhealthy state, use the following troubleshooting steps to resolve the issue.

Check the instance configuration

If the Elastic Graphics command line tool, `egcli.exe`, returns output similar to the following, ensure that your [security group is properly configured](#) and that you launched the instance with Instance Metadata Service enabled.

```
EG Version 1.0.7.4240 (Manager) / N/A (OpenGL Library) / N/A (OpenGL Redirector)
EG Status: Out Of Service
Something prevented the EG Infrastructure to work properly.
```

Stop and start the instance

If your Elastic Graphics accelerator is in an unhealthy state, stopping the instance and starting it again is the simplest option. For more information, see [Manually stop and start your instances](#).

Warning

When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.

Verify the installed components

Open the Windows Control Panel and confirm that the following components are installed:

- Amazon Elastic Graphics Manager
- Amazon Elastic Graphics OpenGL Library
- Amazon EC2 Elastic GPUs OpenGL Redirector

If any of these items are missing, you must install them manually. For more information, see [Install the required software for Elastic Graphics](#).

Check the Elastic Graphics logs

Open the Windows Event Viewer, expand the **Application and Services Logs** section, and search for errors in the following event logs:

- EC2ElasticGPUs
- EC2ElasticGPUs GUI

Why am I seeing multiple ENIs?

When calling [StartInstances](#) on an EC2 instance with an Elastic Graphics accelerator, a new Elastic Network Interface (ENI) is created on the instance to allow OpenGL commands to be sent to the remotely attached graphics card.

If you call [StartInstances](#) many times in a short period of time (a few seconds or less) on the same EC2 instance, a new network interface is created on each call. However:

- Only one network interface will be used by the Elastic Graphics accelerator.
- Extra network interfaces don't incur any charges and will be automatically released in 24 hours.

Monitor Amazon EC2

Monitoring is an important part of maintaining the reliability, availability, and performance of your Amazon Elastic Compute Cloud (Amazon EC2) instances and your AWS solutions. You should collect monitoring data from all of the parts in your AWS solutions so that you can more easily debug a multi-point failure if one occurs. Before you start monitoring Amazon EC2, however, you should create a monitoring plan that should include:

- What are your goals for monitoring?
- What resources will you monitor?
- How often will you monitor these resources?
- What monitoring tools will you use?
- Who will perform the monitoring tasks?
- Who should be notified when something goes wrong?

After you have defined your monitoring goals and have created your monitoring plan, the next step is to establish a baseline for normal Amazon EC2 performance in your environment. You should measure Amazon EC2 performance at various times and under different load conditions. As you monitor Amazon EC2, you should store a history of monitoring data that you collect. You can compare current Amazon EC2 performance to this historical data to help you to identify normal performance patterns and performance anomalies, and devise methods to address them. For example, you can monitor CPU utilization, disk I/O, and network utilization for your EC2 instances. When performance falls outside your established baseline, you might need to reconfigure or optimize the instance to reduce CPU utilization, improve disk I/O, or reduce network traffic.

To establish a baseline you should, at a minimum, monitor the following items:

Item to monitor	Amazon EC2 metric	Monitoring agent/Clo udWatch Logs
CPU utilization	CPUUtilization	
Network utilization	NetworkIn NetworkOut	

Item to monitor	Amazon EC2 metric	Monitoring agent/Clo udWatch Logs
Disk performance	DiskReadOps DiskWriteOps	
Disk Reads/Writes	DiskReadBytes DiskWriteBytes	
Memory utilization, disk swap utilization, disk space utilization, page file utilization, log collection		<p>[Linux and Windows Server instances] Collect Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent</p> <p>[Migration from previous CloudWatch Logs agent on Windows Server instances]] Migrate Windows Server Instance Log Collection to the CloudWatch Agent</p>

Automated and manual monitoring

AWS provides various tools that you can use to monitor Amazon EC2. You can configure some of these tools to do the monitoring for you, while some of the tools require manual intervention.

Monitoring tools

- [Automated monitoring tools](#)
- [Manual monitoring tools](#)

Automated monitoring tools

You can use the following automated monitoring tools to watch Amazon EC2 and report back to you when something is wrong:

- **System status checks** – monitor the AWS systems required to use your instance to ensure that they are working properly. These checks detect problems with your instance that require AWS involvement to repair. When a system status check fails, you can choose to wait for AWS to fix the issue or you can resolve it yourself (for example, by stopping and restarting or terminating and replacing an instance). Examples of problems that cause system status checks to fail include:

- Loss of network connectivity
- Loss of system power
- Software issues on the physical host
- Hardware issues on the physical host that impact network reachability

For more information, see [Status checks for your instances](#).

- **Instance status checks** – monitor the software and network configuration of your individual instance. These checks detect problems that require your involvement to repair. When an instance status check fails, typically you will need to address the problem yourself (for example, by rebooting the instance or by making modifications in your operating system). Examples of problems that may cause instance status checks to fail include:

- Failed system status checks
- Misconfigured networking or startup configuration
- Exhausted memory
- Corrupted file system
- Incompatible kernel

For more information, see [Status checks for your instances](#).

- **Amazon CloudWatch alarms** – watch a single metric over a time period you specify, and perform one or more actions based on the value of the metric relative to a given threshold over a number of time periods. The action is a notification sent to an Amazon Simple Notification Service (Amazon SNS) topic or Amazon EC2 Auto Scaling policy. Alarms invoke actions for sustained state changes only. CloudWatch alarms will not invoke actions simply because they are in a particular state; the state must have changed and been maintained for a specified number of periods. For more information, see [Monitor your instances using CloudWatch](#).

- **Amazon EventBridge** – automate your AWS services and respond automatically to system events. Events from AWS services are delivered to EventBridge in near real time, and you can specify automated actions to take when an event matches a rule you write. For more information, see [What is Amazon EventBridge?](#).
- **Amazon CloudWatch Logs** – monitor, store, and access your log files from Amazon EC2 instances, AWS CloudTrail, or other sources. For more information, see the [Amazon CloudWatch Logs User Guide](#).
- **CloudWatch agent** – collect logs and system-level metrics from both hosts and guests on your EC2 instances and on-premises servers. For more information, see [Collecting Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent](#) in the *Amazon CloudWatch User Guide*.

Manual monitoring tools

Another important part of monitoring Amazon EC2 involves manually monitoring those items that the monitoring scripts, status checks, and CloudWatch alarms don't cover. The Amazon EC2 and CloudWatch console dashboards provide an at-a-glance view of the state of your Amazon EC2 environment.

- Amazon EC2 Dashboard shows:
 - Service Health and Scheduled Events by Region
 - Instance state
 - Status checks
 - Alarm status
 - Instance metric details (In the navigation pane choose **Instances**, select an instance, and choose the **Monitoring** tab)
 - Volume metric details (In the navigation pane choose **Volumes**, select a volume, and choose the **Monitoring** tab)
- Amazon CloudWatch Dashboard shows:
 - Current alarms and status
 - Graphs of alarms and resources
 - Service health status

In addition, you can use CloudWatch to do the following:

- Graph Amazon EC2 monitoring data to troubleshoot issues and discover trends
- Search and browse all your AWS resource metrics
- Create and edit alarms to be notified of problems
- See at-a-glance overviews of your alarms and AWS resources

Best practices for monitoring

Use the following best practices for monitoring to help you with your Amazon EC2 monitoring tasks.

- Make monitoring a priority to head off small problems before they become big ones.
- Create and implement a monitoring plan that collects monitoring data from all of the parts in your AWS solution so that you can more easily debug a multi-point failure if one occurs. Your monitoring plan should address, at a minimum, the following questions:
 - What are your goals for monitoring?
 - What resources will you monitor?
 - How often will you monitor these resources?
 - What monitoring tools will you use?
 - Who will perform the monitoring tasks?
 - Who should be notified when something goes wrong?
- Automate monitoring tasks as much as possible.
- Check the log files on your EC2 instances.

Monitor the status of your instances

You can monitor the status of your instances by viewing status checks and scheduled events for your instances.

A status check gives you the information that results from automated checks performed by Amazon EC2. These automated checks detect whether specific issues are affecting your instances. The status check information, together with the data provided by Amazon CloudWatch, gives you detailed operational visibility into each of your instances.

You can also see status of specific events that are scheduled for your instances. The status of events provides information about upcoming activities that are planned for your instances, such as rebooting or retirement. They also provide the scheduled start and end time of each event.

Contents

- [Status checks for your instances](#)
- [State change events for your instances](#)
- [Scheduled events for your instances](#)

Status checks for your instances

With instance status monitoring, you can quickly determine whether Amazon EC2 has detected any problems that might prevent your instances from running applications. Amazon EC2 performs automated checks on every running EC2 instance to identify hardware and software issues. You can view the results of these status checks to identify specific and detectable problems. The event status data augments the information that Amazon EC2 already provides about the state of each instance (such as pending, running, stopping) and the utilization metrics that Amazon CloudWatch monitors (CPU utilization, network traffic, and disk activity).

Status checks are performed every minute, returning a pass or a fail status. If all checks pass, the overall status of the instance is **OK**. If one or more checks fail, the overall status is **impaired**. Status checks are built into Amazon EC2, so they cannot be disabled or deleted.

When a status check fails, the corresponding CloudWatch metric for status checks is incremented. For more information, see [Status check metrics](#). You can use these metrics to create CloudWatch alarms that are triggered based on the result of the status checks. For example, you can create an alarm to warn you if status checks fail on a specific instance. For more information, see [Create and edit status check alarms](#).

You can also create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically recovers the instance if it becomes impaired due to an underlying issue. For more information, see [Recover your instance](#).

Contents

- [Types of status checks](#)
- [Working with status checks](#)

Types of status checks

There are three types of status checks.

- [System status checks](#)
- [Instance status checks](#)
- [Attached EBS status checks](#)

System status checks

System status checks monitor the AWS systems on which your instance runs. These checks detect underlying problems with your instance that require AWS involvement to repair. When a system status check fails, you can choose to wait for AWS to fix the issue, or you can resolve it yourself. For instances backed by Amazon EBS, you can stop and start the instance yourself, which in most cases results in the instance being migrated to a new host. For Linux instances backed by instance store, you can terminate and replace the instance. For Windows instances, the root volume must be an Amazon EBS volume; instance store is not supported for the root volume. Note that instance store volumes are ephemeral and all data is lost when the instance is stopped.

The following are examples of problems that can cause system status checks to fail:

- Loss of network connectivity
- Loss of system power
- Software issues on the physical host
- Hardware issues on the physical host that impact network reachability

If a system status check fails, we increment the [StatusCheckFailed_System](#) metric.

Bare metal instances

If you perform a restart from the operating system on a bare metal instance, the system status check might temporarily return a fail status. When the instance becomes available, the system status check should return a pass status.

Instance status checks

Instance status checks monitor the software and network configuration of your individual instance. Amazon EC2 checks the health of the instance by sending an address resolution protocol (ARP) request to the network interface (NIC). These checks detect problems that require your

involvement to repair. When an instance status check fails, you typically must address the problem yourself (for example, by rebooting the instance or by making instance configuration changes).

The following are examples of problems that can cause instance status checks to fail:

- Failed system status checks
- Incorrect networking or startup configuration
- Exhausted memory
- Corrupted file system
- During instance reboot or while a Windows instance store-backed instance is being bundled, an instance status check reports a failure until the instance becomes available again.

If an instance status check fails, we increment the [StatusCheckFailed_Instance](#) metric.

Bare metal instances

If you perform a restart from the operating system on a bare metal instance, the instance status check might temporarily return a fail status. When the instance becomes available, the instance status check should return a pass status.

Attached EBS status checks

Attached EBS status checks monitor if the Amazon EBS volumes attached to an instance are reachable and able to complete I/O operations. The `StatusCheckFailed_AttachedEBS` metric is a binary value that indicates impairment if one or more of the EBS volumes attached to the instance are unable to complete I/O operations. These status checks detect underlying issues with the compute or Amazon EBS infrastructure. When the attached EBS status check metric fails, you can either wait for AWS to resolve the issue, or you can take actions, such as replacing the affected volumes or stopping and restarting the instance.

The following are examples of issues that can cause attached EBS status checks to fail:

- Hardware or software issues on the storage subsystems underlying the EBS volumes
- Hardware issues on the physical host that impact reachability of the EBS volumes
- Connectivity issues between the instance and EBS volumes

You can use the `StatusCheckFailed_AttachedEBS` metric to help improve the resilience of your workload. You can use this metric to create Amazon CloudWatch alarms that are triggered

based on the result of the status check. For example, you could fail over to a secondary instance or Availability Zone when you detect a prolonged impact. Alternatively, you can monitor the I/O performance of each attached volume using EBS CloudWatch metrics to detect and replace the impaired volume. If your workload is not driving I/O to any of the EBS volumes attached to your instance, and the attached EBS status check indicates an impairment, you can stop and start the instance to address issues with the physical host that is impacting the reachability of the EBS volumes. For more information, see [Amazon CloudWatch metrics for Amazon EBS](#)

Note

- The attached EBS status check metric is available only for Nitro instances.
- You can monitor the attached EBS status check metric by [creating a CloudWatch alarm](#) based on the StatusCheckFailed_AttachedEBS metric. You can't view this status check by using the [describe-instance-status](#) AWS CLI command.

Working with status checks

You can work with status checks using the console and command line tools, such as the AWS CLI.

Topics

- [View status checks](#)
- [Create and edit status check alarms](#)

View status checks

To view status checks, use one of the following methods.

Console

To view status checks

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. On the **Instances** page, the **Status check** column lists the operational status of each instance.

4. To view the status of a specific instance, select the instance, and then choose the **Status and alarms** tab.

The screenshot shows a table of instances with columns: Name, Instance ID, Instance state, Instance type, Status check, Alarm status, and Availability zone. An instance named 'spot-instance-2' is selected, highlighted with a blue border. Its status check row shows a red warning icon and the text '1/2 checks ...'. Below the table, the instance details are shown: 'Instance: i-01aeed690c9fb5322 (spot-instance-2)'. The 'Status and alarms' tab is selected. Under 'Status checks', it says 'System reachability check passed'. Under 'Metrics', there are two sections: 'Metrics' and 'Alarms'. The 'Alarms' section shows a table with columns: Name, State, Description, Metric name, and State reason. A message at the bottom of the table says 'Instance has no associated alarms'.

If your instance has a failed status check, you typically must address the problem yourself (for example, by rebooting the instance or by making instance configuration changes).

5. To review the CloudWatch metrics for status checks, on the **Status and alarms** tab, expand **Metrics** to see the graphs for the following metrics:

- **Status check failed for system**
- **Status check failed for instance**

For more information, see [the section called “Status check metrics”](#).

Command line

You can view status checks for running instances by using the [describe-instance-status](#) (AWS CLI) command.

To view the status of all instances, use the following command.

```
aws ec2 describe-instance-status
```

To get the status of all instances with an instance status of **impaired**, use the following command.

```
aws ec2 describe-instance-status \
--filters Name=instance-status.status,Values=impaired
```

To get the status of a single instance, use the following command.

```
aws ec2 describe-instance-status \
--instance-ids i-1234567890abcdef0
```

Alternatively, use the following commands:

- [Get-EC2InstanceState](#) (AWS Tools for Windows PowerShell)
- [DescribeInstanceState](#) (Amazon EC2 Query API)

Create and edit status check alarms

You can use the [status check metrics](#) to create CloudWatch alarms to notify you when an instance has a failed status check.

To create a status check alarm, use one of the following methods:

Console

Use the following procedure to configure an alarm that sends you a notification by email, or stops, terminates, or recovers an instance when it fails a status check.

To create a status check alarm

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose the **Status Checks** tab, and choose **Actions**, **Create status check alarm**.
4. On the **Manage CloudWatch alarms** page, under **Add or edit alarm**, choose **Create an alarm**.

5. For **Alarm notification**, turn the toggle on to configure Amazon Simple Notification Service (Amazon SNS) notifications. Select an existing Amazon SNS topic or enter a name to create a new topic.

If you add an email address to the list of recipients or created a new topic, Amazon SNS sends a subscription confirmation email message to each new address. Each recipient must confirm the subscription by choosing the link contained in that message. Alert notifications are sent only to confirmed addresses.

6. For **Alarm action**, turn the toggle on to specify an action to take when the alarm is triggered. Select the action.
7. For **Alarm thresholds**, specify the metric and criteria for the alarm.

You can leave the default settings for **Group samples by (Average)** and **Type of data to sample (Status check failed:either)**, or you can change them to suit your needs.

For **Consecutive period**, set the number of periods to evaluate and, in **Period**, enter the evaluation period duration before triggering the alarm and sending an email.

8. (Optional) For **Sample metric data**, choose **Add to dashboard**.
9. Choose **Create**.

If you need to make changes to an instance status alarm, you can edit it.

To edit a status check alarm

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitoring, Manage CloudWatch alarms**.
4. On the **Manage CloudWatch alarms** page, under **Add or edit alarm**, choose **Edit an alarm**.
5. For **Search for alarm**, choose the alarm.
6. When you are finished making changes, choose **Update**.

Command line

In the following example, the alarm publishes a notification to an SNS topic, `arn:aws:sns:us-west-2:111122223333:my-sns-topic`, when the instance fails either

the instance check or system status check for at least two consecutive periods. The CloudWatch metric used is StatusCheckFailed.

To create a status check alarm using the AWS CLI

1. Select an existing SNS topic or create a new one. For more information, see [Using the AWS CLI with Amazon SNS](#) in the *AWS Command Line Interface User Guide*.
2. Use the following [list-metrics](#) command to view the available Amazon CloudWatch metrics for Amazon EC2.

```
aws cloudwatch list-metrics --namespace AWS/EC2
```

3. Use the following [put-metric-alarm](#) command to create the alarm.

```
aws cloudwatch put-metric-alarm \
--alarm-name StatusCheckFailed-Alarm-for-i-1234567890abcdef0 \
--metric-name StatusCheckFailed \
--namespace AWS/EC2 \
--statistic Maximum \
--dimensions Name=InstanceId,Value=i-1234567890abcdef0 \
--unit Count \
--period 300 \
--evaluation-periods 2 \
--threshold 1 \
--comparison-operator GreaterThanOrEqualToThreshold \
--alarm-actions arn:aws:sns:us-west-2:111122223333:my-sns-topic
```

The period is the time frame, in seconds, in which Amazon CloudWatch metrics are collected. This example uses 300, which is 60 seconds multiplied by 5 minutes. The evaluation period is the number of consecutive periods for which the value of the metric must be compared to the threshold. This example uses 2. The alarm actions are the actions to perform when this alarm is triggered. This example configures the alarm to send an email using Amazon SNS.

State change events for your instances

Amazon EC2 sends an EC2 Instance State-change Notification event to Amazon EventBridge when the state of an instance changes.

The following is example data for this event. In this example, the instance entered the pending state.

```
{  
    "id": "7bf73129-1428-4cd3-a780-95db273d1602",  
    "detail-type": "EC2 Instance State-change Notification",  
    "source": "aws.ec2",  
    "account": "123456789012",  
    "time": "2021-11-11T21:29:54Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:instance/i-abcd1111"  
    ],  
    "detail": {  
        "instance-id": "i-abcd1111",  
        "state": "pending"  
    }  
}
```

The possible values for state are:

- pending
- running
- stopping
- stopped
- shutting-down
- terminated

When you launch or start an instance, it enters the pending state and then the running state. When you stop an instance, it enters the stopping state and then the stopped state. When you terminate an instance, it enters the shutting-down state and then the terminated state.

Get an email notification when an instance changes state

To receive email notifications when your instance changes state, create an Amazon SNS topic and then create an EventBridge rule for the EC2 Instance State-change Notification event.

To create an SNS topic

1. Open the Amazon SNS console at <https://console.aws.amazon.com/sns/v3/home>.
2. In the navigation pane, choose **Topics**.
3. Choose **Create topic**.
4. For **Type**, choose **Standard**.
5. For **Name**, enter a name for your topic.
6. Choose **Create topic**.
7. Choose **Create subscription**.
8. For **Protocol**, choose **Email**.
9. For **Endpoint**, enter the email address that receives the notifications.
10. Choose **Create subscription**.
11. You'll receive an email message with the following subject line: AWS Notification - Subscription Confirmation. Follow the directions to confirm your subscription.

To create an EventBridge rule

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.
3. For **Name**, enter a name for your rule.
4. For **Rule type**, choose **Rule with an event pattern**.
5. Choose **Next**.
6. For **Event pattern**, do the following:
 - a. For **Event source**, choose **AWS services**.
 - b. For **AWS service**, choose **EC2**.
 - c. For **Event type**, choose **EC2 Instance State-change Notification**.
 - d. By default, we send notifications for any state change for any instance. If you prefer, you can select specific states or specific instances.
7. Choose **Next**.
8. Specify a target as follows:
 - a. For **Target types**, choose **AWS service**.

- b. For **Select a target**, choose **SNS topic**.
 - c. For **Topic**, choose the SNS topic that you created in the previous procedure.
9. Choose **Next**.
10. (Optional) Add tags to your rule.
11. Choose **Next**.
12. Choose **Create rule**.
13. To test your rule, initiate a state change. For example, start a stopped instance, stop a running instance, or launch an instance. You'll receive email messages with the following subject line: AWS Notification Message. The body of the email contains the event data.

Scheduled events for your instances

AWS can schedule events for your instances, such as a reboot, stop/start, or retirement. These events do not occur frequently. If one of your instances will be affected by a scheduled event, AWS sends an email to the email address that's associated with your AWS account prior to the scheduled event. The email provides details about the event, including the start and end date. Depending on the event, you might be able to take action to control the timing of the event. AWS also sends an AWS Health event, which you can monitor and manage by using Amazon CloudWatch Events. For more information about monitoring AWS Health events with CloudWatch, see [Monitoring AWS Health events with CloudWatch Events](#).

Scheduled events are managed by AWS; you cannot schedule events for your instances. You can view the events scheduled by AWS, customize scheduled event notifications to include or remove tags from the email notification, and perform actions when an instance is scheduled to reboot, retire, or stop.

To update the contact information for your account so that you can be sure to be notified about scheduled events, go to the [Account Settings](#) page.

Note

When an instance is affected by a scheduled event, and it is part of an Auto Scaling group, Amazon EC2 Auto Scaling eventually replaces it as part of its health checks, with no further action necessary on your part. For more information about the health checks performed by Amazon EC2 Auto Scaling, see [Health checks for Auto Scaling instances](#) in the *Amazon EC2 Auto Scaling User Guide*.

Contents

- [Types of scheduled events](#)
- [View scheduled events](#)
- [Customize scheduled event notifications](#)
- [Work with instances scheduled to stop or retire](#)
- [Work with instances scheduled for reboot](#)
- [Work with instances scheduled for maintenance](#)
- [Reschedule a scheduled event](#)
- [Define event windows for scheduled events](#)

Types of scheduled events

Amazon EC2 can create the following types of events for your instances, where the event occurs at a scheduled time:

- **Instance stop:** At the scheduled time, the instance is stopped. When you start it again, it's migrated to a new host. Applies only to instances backed by Amazon EBS.
- **Instance retirement:** At the scheduled time, the instance is stopped if it is backed by Amazon EBS, or terminated if it is backed by instance store.
- **Instance reboot:** At the scheduled time, the instance is rebooted.
- **System reboot:** At the scheduled time, the host for the instance is rebooted.
- **System maintenance:** At the scheduled time, the instance might be temporarily affected by network maintenance or power maintenance.

View scheduled events

In addition to receiving notification of scheduled events in email, you can check for scheduled events by using one of the following methods.

Console

To view scheduled events for your instances

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. The dashboard displays any resources with an associated event under **Scheduled events**.

Scheduled events

US East (N. Virginia)

- **7 instance(s) have scheduled events**
- **1 volume(s) are impaired**

3. For more detail, choose **Events** in the navigation pane. Any resources with an associated event are displayed. You can filter by characteristics such as event type, resource type, and Availability Zone.

Events (103)							Actions
Resource type: Instance		Event status: Scheduled		Event type: instance-stop		Clear filters	
Resource ID	Event status	Event type	Description	Progress	Duration	Start time	
i-02c48ffffba61cd16f	Scheduled	instance-stop	The instance is running on ...	Starts in 13 days		2019/07/22 13:00 GMT+2	

AWS CLI

To view scheduled events for your instances

Use the [describe-instance-status](#) command.

```
aws ec2 describe-instance-status \
--instance-id i-1234567890abcdef0 \
--query "InstanceStatuses[].Events"
```

The following example output shows a reboot event.

```
[{"Events": [{"InstanceEventId": "instance-event-0d59937288b749b32", "Code": "system-reboot", "Description": "The instance is scheduled for a reboot", "NotAfter": "2019-03-15T22:00:00.000Z"}]}
```

```
        "NotBefore": "2019-03-14T20:00:00.000Z",
        "NotBeforeDeadline": "2019-04-05T11:00:00.000Z"
    }
]
]
```

The following example output shows an instance retirement event.

```
[
  "Events": [
    {
      "InstanceEventId": "instance-event-0e439355b779n26",
      "Code": "instance-stop",
      "Description": "The instance is running on degraded hardware",
      "NotBefore": "2015-05-23T00:00:00.000Z"
    }
  ]
]
```

PowerShell

To view scheduled events for your instances using the AWS Tools for Windows PowerShell

Use the following [Get-EC2InstanceState](#) command.

```
PS C:\> (Get-EC2InstanceState -InstanceId i-1234567890abcdef0).Events
```

The following example output shows an instance retirement event.

```
Code      : instance-stop
Description : The instance is running on degraded hardware
NotBefore : 5/23/2015 12:00:00 AM
```

Instance metadata

To view scheduled events for your instances using instance metadata

You can retrieve information about active maintenance events for your instances from the [instance metadata](#) by using Instance Metadata Service Version 2 or Instance Metadata Service Version 1.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/meta-data/events/maintenance/scheduled
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/events/maintenance/scheduled
```

The following is example output with information about a scheduled system reboot event, in JSON format.

```
[  
 {  
   "NotBefore" : "21 Jan 2019 09:00:43 GMT",  
   "Code" : "system-reboot",  
   "Description" : "scheduled reboot",  
   "EventId" : "instance-event-0d59937288b749b32",  
   "NotAfter" : "21 Jan 2019 09:17:23 GMT",  
   "State" : "active"  
 }  
]
```

To view event history about completed or canceled events for your instances using instance metadata

You can retrieve information about completed or canceled events for your instances from [instance metadata](#) by using Instance Metadata Service Version 2 or Instance Metadata Service Version 1.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/meta-data/events/maintenance/history
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/events/maintenance/history
```

The following is example output with information about a system reboot event that was canceled, and a system reboot event that was completed, in JSON format.

```
[  
 {  
   "NotBefore" : "21 Jan 2019 09:00:43 GMT",  
   "Code" : "system-reboot",  
   "Description" : "[Canceled] scheduled reboot",  
   "EventId" : "instance-event-0d59937288b749b32",  
   "NotAfter" : "21 Jan 2019 09:17:23 GMT",  
   "State" : "canceled"  
,  
 {  
   "NotBefore" : "29 Jan 2019 09:00:43 GMT",  
   "Code" : "system-reboot",  
   "Description" : "[Completed] scheduled reboot",  
   "EventId" : "instance-event-0d59937288b749b32",  
   "NotAfter" : "29 Jan 2019 09:17:23 GMT",  
   "State" : "completed"  
 }  
 ]
```

AWS Health

You can use the AWS Health Dashboard to learn about events that can affect your instance. The AWS Health Dashboard organizes issues in three groups: open issues, scheduled changes, and other notifications. The scheduled changes group contains items that are ongoing or upcoming.

For more information, see [Getting started with the AWS Health Dashboard](#) in the *AWS Health User Guide*.

Customize scheduled event notifications

You can customize scheduled event notifications to include tags in the email notification. This makes it easier to identify the affected resource (instances or Dedicated Hosts) and to prioritize actions for the upcoming event.

When you customize event notifications to include tags, you can choose to include:

- All of the tags that are associated with the affected resource
- Only specific tags that are associated with the affected resource

For example, suppose that you assign application, costcenter, project, and owner tags to all of your instances. You can choose to include all of the tags in event notifications. Alternatively, if you'd like to see only the owner and project tags in event notifications, then you can choose to include only those tags.

After you select the tags to include, the event notifications will include the resource ID (instance ID or Dedicated Host ID) and the tag key and value pairs that are associated with the affected resource.

Tasks

- [Include tags in event notifications](#)
- [Remove tags from event notifications](#)
- [View the tags to be included in event notifications](#)

Include tags in event notifications

The tags that you choose to include apply to all resources (instances and Dedicated Hosts) in the selected Region. To customize event notifications in other Regions, first select the required Region and then perform the following steps.

You can include tags in event notifications by using one of the following methods.

Console

To include tags in event notifications

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event notifications**.
4. Turn on **Include tags in event notifications**.
5. Do one of the following, depending on the tags that you want to include in event notifications:
 - To include all tags associated with the affected instance or Dedicated Host, select **Include all tags**.

- To select the tags to include, select **Choose the tags to include** and then select or enter the tag keys.
6. Choose **Save**.

AWS CLI

To include all tags in event notifications

Use the [register-instance-event-notification-attributes](#) AWS CLI command and set the `IncludeAllTagsOfInstance` parameter to `true`.

```
aws ec2 register-instance-event-notification-attributes \
--instance-tag-attribute "IncludeAllTagsOfInstance=true"
```

To include specific tags in event notifications

Use the [register-instance-event-notification-attributes](#) AWS CLI command and specify the tags to include by using the `InstanceTagKeys` parameter.

```
aws ec2 register-instance-event-notification-attributes \
--instance-tag-attribute 'InstanceTagKeys=[{"tag_key_1", "tag_key_2",
>tag_key_3"}'
```

Remove tags from event notifications

You can remove tags from event notifications by using one of the following methods.

Console

To remove tags from event notifications

- Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
- In the navigation pane, choose **Events**.
- Choose **Actions, Manage event notifications**.
- To remove all tags from event notifications, turn off **Include tags in event notifications**.
- To remove specific tags from event notifications, choose the X) for the corresponding tag keys.

6. Choose **Save**.

AWS CLI

To remove all tags from event notifications

Use the [deregister-instance-event-notification-attributes](#) AWS CLI command and set the `IncludeAllTagsOfInstance` parameter to `false`.

```
aws ec2 deregister-instance-event-notification-attributes \
--instance-tag-attribute "IncludeAllTagsOfInstance=false"
```

To remove specific tags from event notifications

Use the [deregister-instance-event-notification-attributes](#) AWS CLI command and specify the tags to remove by using the `InstanceTagKeys` parameter.

```
aws ec2 deregister-instance-event-notification-attributes \
--instance-tag-attribute 'InstanceTagKeys=[{"tag_key_1", "tag_key_2",
>tag_key_3"}']'
```

View the tags to be included in event notifications

You can view the tags that are to be included in event notifications by using one of the following methods.

Console

To view the tags that are to be included in event notifications

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event notifications**.

AWS CLI

To view the tags that are to be included in event notifications

Use the [describe-instance-event-notification-attributes](#) AWS CLI command.

```
aws ec2 describe-instance-event-notification-attributes
```

Work with instances scheduled to stop or retire

When AWS detects irreparable failure of the underlying host for your instance, it schedules the instance to stop or terminate, depending on the type of root device for the instance. If the root device is an EBS volume, the instance is scheduled to stop. If the root device is an instance store volume, the instance is scheduled to terminate. For more information, see [Instance retirement](#).

Important

Any data stored on instance store volumes is lost when an instance is stopped, hibernated, or terminated. This includes instance store volumes that are attached to an instance that has an EBS volume as the root device. Be sure to save data from your instance store volumes that you might need later before the instance is stopped, hibernated, or terminated.

Actions for Instances Backed by Amazon EBS

You can wait for the instance to stop as scheduled. Alternatively, you can stop and start the instance yourself, which migrates it to a new host. For more information about stopping your instance, in addition to information about the changes to your instance configuration when it's stopped, see [Stop and start Amazon EC2 instances](#).

You can automate an immediate stop and start in response to a scheduled instance stop event. For more information, see [Automating actions for Amazon EC2 instances](#) in the *AWS Health User Guide*.

Actions for Instances Backed by Instance Store

We recommend that you launch a replacement instance from your most recent AMI and migrate all necessary data to the replacement instance before the instance is scheduled to terminate. Then, you can terminate the original instance, or wait for it to terminate as scheduled.

Work with instances scheduled for reboot

When AWS must perform tasks such as installing updates or maintaining the underlying host, it can schedule the instance or the underlying host for a reboot. You can [reschedule most reboot events](#) so that your instance is rebooted at a specific date and time that suits you.

View the reboot event type

You can view whether a reboot event is an instance reboot or a system reboot by using one of the following methods.

Console

To view the type of scheduled reboot event

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Resource type: instance** from the filter list.
4. For each instance, view the value in the **Event type** column. The value is either **system-reboot** or **instance-reboot**.

AWS CLI

To view the type of scheduled reboot event

Use the [describe-instance-status](#) command.

```
aws ec2 describe-instance-status \
--instance-id i-1234567890abcdef0
```

For scheduled reboot events, the value for Code is either **system-reboot** or **instance-reboot**. The following example output shows a **system-reboot** event.

```
[{"Events": [{"InstanceEventId": "instance-event-0d59937288b749b32", "Code": "system-reboot", "Description": "The instance is scheduled for a reboot", "NotAfter": "2019-03-14T22:00:00.000Z", "NotBefore": "2019-03-14T20:00:00.000Z", "NotBeforeDeadline": "2019-04-05T11:00:00.000Z"}]}
```

Actions for instance reboot

You can wait for the instance reboot to occur within its scheduled maintenance window, [reschedule](#) the instance reboot to a date and time that suits you, or [reboot](#) the instance yourself at a time that is convenient for you.

After your instance is rebooted, the scheduled event is cleared and the event's description is updated. The pending maintenance to the underlying host is completed, and you can begin using your instance again after it has fully booted.

Actions for system reboot

It is not possible for you to reboot the system yourself. You can wait for the system reboot to occur during its scheduled maintenance window, or you can [reschedule](#) the system reboot to a date and time that suits you. A system reboot typically completes in a matter of minutes. After the system reboot has occurred, the instance retains its IP address and DNS name, and any data on local instance store volumes is preserved. After the system reboot is complete, the scheduled event for the instance is cleared, and you can verify that the software on your instance is operating as expected.

Alternatively, if it is necessary to maintain the instance at a different time and you can't reschedule the system reboot, then you can stop and start an Amazon EBS-backed instance, which migrates it to a new host. However, the data on the local instance store volumes is not preserved. You can also automate an immediate instance stop and start in response to a scheduled system reboot event.

For more information, see [Automating Actions for EC2 Instances](#) in the *AWS Health User Guide*. For an instance store-backed instance, if you can't reschedule the system reboot, then you can launch a replacement instance from your most recent AMI, migrate all necessary data to the replacement instance before the scheduled maintenance window, and then terminate the original instance.

Work with instances scheduled for maintenance

When AWS must maintain the underlying host for an instance, it schedules the instance for maintenance. There are two types of maintenance events: network maintenance and power maintenance.

During network maintenance, scheduled instances lose network connectivity for a brief period of time. Normal network connectivity to your instance is restored after maintenance is complete.

During power maintenance, scheduled instances are taken offline for a brief period, and then rebooted. When a reboot is performed, all of your instance's configuration settings are retained.

After your instance has rebooted (this normally takes a few minutes), verify that your application is working as expected. At this point, your instance should no longer have a scheduled event associated with it, or if it does, the description of the scheduled event begins with **[Completed]**. It sometimes takes up to 1 hour for the instance status description to refresh. Completed maintenance events are displayed on the Amazon EC2 console dashboard for up to a week.

Actions for Instances Backed by Amazon EBS

You can wait for the maintenance to occur as scheduled. Alternatively, you can stop and start the instance, which migrates it to a new host. For more information about stopping your instance, in addition to information about the changes to your instance configuration when it's stopped, see [Stop and start Amazon EC2 instances](#).

You can automate an immediate stop and start in response to a scheduled maintenance event. For more information, see [Automating Actions for EC2 Instances](#) in the *AWS Health User Guide*.

Actions for instances backed by instance store

You can wait for the maintenance to occur as scheduled. Alternatively, if you want to maintain normal operation during a scheduled maintenance window, you can launch a replacement instance from your most recent AMI, migrate all necessary data to the replacement instance before the scheduled maintenance window, and then terminate the original instance.

Reschedule a scheduled event

You can reschedule an event so that it occurs at a specific date and time that suits you. Only events that have a deadline date can be rescheduled. There are other [limitations for rescheduling an event](#).

You can reschedule an event by using one of the following methods.

Console

To reschedule an event

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Resource type: instance** from the filter list.
4. Select one or more instances, and then choose **Actions, Schedule event**.

Only events that have an event deadline date, indicated by a value for **Deadline**, can be rescheduled. If one of the selected events does not have a deadline date, **Actions**, **Schedule event** is disabled.

5. For **New start time**, enter a new date and time for the event. The new date and time must occur before the **Event deadline**.
6. Choose **Save**.

It might take a minute or two for the updated event start time to be reflected in the console.

AWS CLI

To reschedule an event

1. Only events that have an event deadline date, indicated by a value for **NotBeforeDeadline**, can be rescheduled. Use the [describe-instance-status](#) command to view the **NotBeforeDeadline** parameter value.

```
aws ec2 describe-instance-status \
--instance-id i-1234567890abcdef0
```

The following example output shows a **system-reboot** event that can be rescheduled because **NotBeforeDeadline** contains a value.

```
[{"Events": [{"InstanceEventId": "instance-event-0d59937288b749b32", "Code": "system-reboot", "Description": "The instance is scheduled for a reboot", "NotAfter": "2019-03-14T22:00:00.000Z", "NotBefore": "2019-03-14T20:00:00.000Z", "NotBeforeDeadline": "2019-04-05T11:00:00.000Z"}]}
```

2. To reschedule the event, use the [modify-instance-event-start-time](#) command. Specify the new event start time by using the not-before parameter. The new event start time must fall before the NotBeforeDeadline.

```
aws ec2 modify-instance-event-start-time \
--instance-id i-1234567890abcdef0 \
--instance-event-id instance-event-0d59937288b749b32 \
--not-before 2019-03-25T10:00:00.000
```

It might take a minute or two before the [describe-instance-status](#) command returns the updated not-before parameter value.

Limitations

- Only events with an event deadline date can be rescheduled. The event can be rescheduled up to the event deadline date. The **Deadline** column in the console and the NotBeforeDeadline field in the AWS CLI indicate if the event has a deadline date.
- Only events that have not yet started can be rescheduled. The **Start time** column in the console and the NotBefore field in the AWS CLI indicate the event start time. Events that are scheduled to start in the next 5 minutes cannot be rescheduled.
- The new event start time must be at least 60 minutes from the current time.
- If you reschedule multiple events using the console, the event deadline date is determined by the event with the earliest event deadline date.

Define event windows for scheduled events

You can define custom event windows that recur weekly for scheduled events that reboot, stop, or terminate your Amazon EC2 instances. You can associate one or more instances with an event window. If a scheduled event for those instances is planned, AWS will schedule the events within the associated event window.

You can use event windows to maximize workload availability by specifying event windows that occur during off-peak periods for your workload. You can also align the event windows with your internal maintenance schedules.

You define an event window by specifying a set of time ranges. The minimum time range is 2 hours. The combined time ranges must total at least 4 hours.

You can associate one or more instances with an event window by using either instance IDs or instance tags. You can also associate Dedicated Hosts with an event window by using the host ID.

Warning

Event windows are applicable only for scheduled events that stop, reboot, or terminate instances.

Event windows are *not* applicable for:

- Expedited scheduled events and network maintenance events.
- Unscheduled maintenance such as AutoRecovery and unplanned reboots.

Work with event windows

- [Considerations](#)
- [View event windows](#)
- [Create event windows](#)
- [Modify event windows](#)
- [Delete event windows](#)
- [Tag event windows](#)

Considerations

- All event window times are in UTC.
- The minimum weekly event window duration is 4 hours.
- The time ranges within an event window must each be at least 2 hours.
- Only one target type (instance ID, Dedicated Host ID, or instance tag) can be associated with an event window.
- A target (instance ID, Dedicated Host ID, or instance tag) can only be associated with one event window.
- A maximum of 100 instance IDs, or 50 Dedicated Host IDs, or 50 instance tags can be associated with an event window. The instance tags can be associated with any number of instances.
- A maximum of 200 event windows can be created per AWS Region.
- Multiple instances that are associated with event windows can potentially have scheduled events occur at the same time.

- If AWS has already scheduled an event, modifying an event window won't change the time of the scheduled event. If the event has a deadline date, you can [reschedule the event](#).
- You can stop and start an instance prior to the scheduled event, which migrates the instance to a new host, and the scheduled event will no longer take place.

View event windows

You can view event windows by using one of the following methods.

Console

To view event windows

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select an event window to view its details.

AWS CLI

To describe all event windows

Use the [describe-instance-event-windows](#) command.

```
aws ec2 describe-instance-event-windows \
--region us-east-1
```

Expected output

```
{
  "InstanceEventWindows": [
    {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
        "InstanceIds": [
          "i-1234567890abcdef0",
```

```
        "i-0598c7d356eba48d7"
    ],
    "Tags": [],
    "DedicatedHostIds": []
},
"State": "active",
"Tags": []
}
}

],
"NextToken": "9d624e0c-388b-4862-a31e-a85c64fc1d4a"
}
```

To describe a specific event window

Use the [describe-instance-event-windows](#) command with the `--instance-event-window-id` parameter to describe a specific event window.

```
aws ec2 describe-instance-event-windows \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890
```

To describe event windows that match one or more filters

Use the [describe-instance-event-windows](#) command with the `--filters` parameter. In the following example, the `instance-id` filter is used to describe all of the event windows that are associated with the specified instance.

When a filter is used, it performs a direct match. However, the `instance-id` filter is different. If there is no direct match to the instance ID, then it falls back to indirect associations with the event window, such as the instance's tags or Dedicated Host ID (if the instance is on a Dedicated Host).

For the list of supported filters, see [describe-instance-event-windows](#) in the *AWS CLI Reference*.

```
aws ec2 describe-instance-event-windows \
--region us-east-1 \
--filters Name=instance-id,Values=i-1234567890abcdef0 \
--max-results 100 \
```

```
--next-token <next-token-value>
```

Expected output

In the following example, the instance is on a Dedicated Host, which is associated with the event window.

```
{  
    "InstanceEventWindows": [  
        {  
            "InstanceEventWindowId": "iew-0dbc0adb66f235982",  
            "TimeRanges": [  
                {  
                    "StartWeekDay": "sunday",  
                    "StartHour": 2,  
                    "EndWeekDay": "sunday",  
                    "EndHour": 8  
                }  
            ],  
            "Name": "myEventWindowName",  
            "AssociationTarget": {  
                "InstanceIds": [],  
                "Tags": [],  
                "DedicatedHostIds": [  
                    "h-0140d9a7ecbd102dd"  
                ]  
            },  
            "State": "active",  
            "Tags": []  
        }  
    ]  
}
```

Create event windows

You can create one or more event windows. For each event window, you specify one or more blocks of time. For example, you can create an event window with blocks of time that occur every day at 4 AM for 2 hours. Or you can create an event window with blocks of time that occur on Sundays from 2 AM to 4 AM and on Wednesdays from 3 AM to 5 AM.

For the event window constraints, see [Considerations](#) earlier in this topic.

Event windows recur weekly until you delete them.

Use one of the following methods to create an event window.

Console

To create an event window

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Choose **Create instance event window**.
5. For **Event window name**, enter a descriptive name for the event window.
6. For **Event window schedule**, choose to specify the blocks of time in the event window by using the cron schedule builder or by specifying time ranges.
 - If you choose **Cron schedule builder**, specify the following:
 1. For **Days (UTC)**, specify the days of the week on which the event window occurs.
 2. For **Start time (UTC)**, specify the time when the event window begins.
 3. For **Duration**, specify the duration of the blocks of time in the event window. The minimum duration per block of time is 2 hours. The minimum duration of the event window must equal or exceed 4 hours in total. All times are in UTC.
 - If you choose **Time ranges**, choose **Add new time range** and specify the start day and time and the end day and time. Repeat for each time range. The minimum duration per time range is 2 hours. The minimum duration for all time ranges combined must equal or exceed 4 hours in total.
7. (Optional) For **Target details**, associate one or more instances with the event window so that if the instances are scheduled for maintenance, the scheduled event will occur during the associated event window. You can associate one or more instances with an event window by using instance IDs or instance tags. You can associate Dedicated Hosts with an event window by using the host ID.

Note that you can create the event window without associating a target with the window. Later, you can modify the window to associate one or more targets.

8. (Optional) For **Event window tags**, choose **Add tag**, and enter the key and value for the tag. Repeat for each tag.

9. Choose **Create event window**.

AWS CLI

To create an event window using the AWS CLI, you first create the event window, and then you associate one or more targets with the event window.

Create an event window

You can define either a set of time ranges or a cron expression when creating the event window, but not both.

To create an event window with a time range

Use the [create-instance-event-window](#) command and specify the `--time-range` parameter. You can't also specify the `--cron-expression` parameter.

```
aws ec2 create-instance-event-window \
  --region us-east-1 \
  --time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8 \
  --tag-specifications "ResourceType=instance-event-
window,Tags=[{Key=K1,Value=V1}]" \
  --name myEventWindowName
```

Expected output

```
{  
  "InstanceEventWindow": {  
    "InstanceEventWindowId": "iew-0abcdef1234567890",  
    "TimeRanges": [  
      {  
        "StartWeekDay": "monday",  
        "StartHour": 2,  
        "EndWeekDay": "wednesday",  
        "EndHour": 8  
      }  
    ],  
    "Name": "myEventWindowName",  
    "State": "creating",  
    "Tags": [  
      {  
        "Key": "K1",  
        "Value": "V1"  
      }  
    ]  
  }  
}
```

```
        "Key": "K1",
        "Value": "V1"
    }
]
}
}
```

To create an event window with a cron expression

Use the [create-instance-event-window](#) command and specify the `--cron-expression` parameter. You can't also specify the `--time-range` parameter.

```
aws ec2 create-instance-event-window \
--region us-east-1 \
--cron-expression "* 21-23 * * 2,3" \
--tag-specifications "ResourceType=instance-event-
window,Tags=[{Key=K1,Value=V1}]" \
--name myEventWindowName
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

Associate a target with an event window

You can associate only one type of target (instance IDs, Dedicated Host IDs, or instance tags) with an event window.

To associate instance tags with an event window

Use the [associate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To associate instance tags, specify the `--association-target` parameter, and for the parameter values, specify one or more tags.

```
aws ec2 associate-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Expected output

```
{  
    "InstanceEventWindow": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "Name": "myEventWindowName",  
        "CronExpression": "* 21-23 * * 2,3",  
        "AssociationTarget": {  
            "InstanceIds": [],  
            "Tags": [  
                {  
                    "Key": "k2",  
                    "Value": "v2"  
                },  
                {  
                    "Key": "k1",  
                    "Value": "v1"  
                }  
            ],  
            "DedicatedHostIds": []  
        },  
        "State": "creating"  
    }  
}
```

To associate one or more instances with an event window

Use the [associate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To associate instances, specify the `--association-target` parameter, and for the parameter values, specify one or more instance IDs.

```
aws ec2 associate-instance-event-window \
```

```
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [
                "i-1234567890abcdef0",
                "i-0598c7d356eba48d7"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

To associate a Dedicated Host with an event window

Use the [associate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To associate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 associate-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target "DedicatedHostIds=h-029fa35a02b99801d"
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
```

```
    "AssociationTarget": {
        "InstanceIds": [],
        "Tags": [],
        "DedicatedHostIds": [
            "h-029fa35a02b99801d"
        ]
    },
    "State": "creating"
}
}
```

Modify event windows

You can modify all of the fields of an event window except its ID. For example, when daylight savings begin, you might want to modify the event window schedule. For existing event windows, you might want to add or remove targets.

Use one of the following methods to modify an event window.

Console

To modify an event window

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select the event window to modify, and then choose **Actions, Modify instance event window**.
5. Modify the fields in the event window, and then choose **Modify event window**.

AWS CLI

To modify an event window using the AWS CLI, you can modify the time range or cron expression, and associate or disassociate one or more targets with the event window.

Modify the event window time

You can modify either a time range or a cron expression when modifying the event window, but not both.

To modify the time range of an event window

Use the [modify-instance-event-window](#) command and specify the event window to modify. Specify the `--time-range` parameter to modify the time range. You can't also specify the `--cron-expression` parameter.

```
aws ec2 modify-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "TimeRanges": [
            {
                "StartWeekDay": "monday",
                "StartHour": 2,
                "EndWeekDay": "wednesday",
                "EndHour": 8
            }
        ],
        "Name": "myEventWindowName",
        "AssociationTarget": {
            "InstanceIds": [
                "i-0abcdef1234567890",
                "i-0be35f9acb8ba01f0"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

To modify a set of time ranges for an event window

Use the [modify-instance-event-window](#) command and specify the event window to modify. Specify the --time-range parameter to modify the time range. You can't also specify the --cron-expression parameter in the same call.

```
aws ec2 modify-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--time-range '[{"StartWeekDay": "monday", "StartHour": 2, "EndWeekDay": "wednesday", "EndHour": 8},
 {"StartWeekDay": "thursday", "StartHour": 2, "EndWeekDay": "friday",
 "EndHour": 8}]'
```

Expected output

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "TimeRanges": [
      {
        "StartWeekDay": "monday",
        "StartHour": 2,
        "EndWeekDay": "wednesday",
        "EndHour": 8
      },
      {
        "StartWeekDay": "thursday",
        "StartHour": 2,
        "EndWeekDay": "friday",
        "EndHour": 8
      }
    ],
    "Name": "myEventWindowName",
    "AssociationTarget": {
      "InstanceIds": [
        "i-0abcdef1234567890",
        "i-0be35f9acb8ba01f0"
      ],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating",
```

```
    "Tags": [
      {
        "Key": "K1",
        "Value": "V1"
      }
    ]
}
```

To modify the cron expression of an event window

Use the [modify-instance-event-window](#) command and specify the event window to modify. Specify the `--cron-expression` parameter to modify the cron expression. You can't also specify the `--time-range` parameter.

```
aws ec2 modify-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--cron-expression "* 21-23 * * 2,3"
```

Expected output

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [
        "i-0abcdef1234567890",
        "i-0be35f9acb8ba01f0"
      ],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating",
    "Tags": [
      {
        "Key": "K1",
        "Value": "V1"
      }
    ]
}
```

```
    }  
}
```

Modify the targets associated with an event window

You can associate additional targets with an event window. You can also disassociate existing targets from an event window. However, only one type of target (instance IDs, Dedicated Host IDs, or instance tags) can be associated with an event window.

To associate additional targets with an event window

For the instructions on how to associate targets with an event window, see [Associate a target with an event window](#).

To disassociate instance tags from an event window

Use the [disassociate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To disassociate instance tags, specify the `--association-target` parameter, and for the parameter values, specify one or more tags.

```
aws ec2 disassociate-instance-event-window \  
  --region us-east-1 \  
  --instance-event-window-id iew-0abcdef1234567890 \  
  --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Expected output

```
{  
  "InstanceEventWindow": {  
    "InstanceId": "i-00000000000000000",  
    "Name": "myEventWindowName",  
    "CronExpression": "* 21-23 * * 2,3",  
    "AssociationTarget": {  
      "InstanceIds": [],  
      "Tags": [],  
      "DedicatedHostIds": []  
    },  
    "State": "creating"  
  }  
}
```

To disassociate one or more instances from an event window

Use the [disassociate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To disassociate instances, specify the `--association-target` parameter, and for the parameter values, specify one or more instance IDs.

```
aws ec2 disassociate-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Expected output

```
{  
    "InstanceEventWindow": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "Name": "myEventWindowName",  
        "CronExpression": "* 21-23 * * 2,3",  
        "AssociationTarget": {  
            "InstanceIds": [],  
            "Tags": [],  
            "DedicatedHostIds": []  
        },  
        "State": "creating"  
    }  
}
```

To disassociate a Dedicated Host from an event window

Use the [disassociate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To disassociate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 disassociate-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target DedicatedHostIds=h-029fa35a02b99801d
```

Expected output

```
{
```

```
"InstanceEventWindow": {  
    "InstanceEventWindowId": "iew-0abcdef1234567890",  
    "Name": "myEventWindowName",  
    "CronExpression": "* 21-23 * * 2,3",  
    "AssociationTarget": {  
        "InstanceIds": [],  
        "Tags": [],  
        "DedicatedHostIds": []  
    },  
    "State": "creating"  
}  
}
```

Delete event windows

You can delete one event window at a time by using one of the following methods.

Console

To delete an event window

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select the event window to delete, and then choose **Actions, Delete instance event window**.
5. When prompted, enter **delete**, and then choose **Delete**.

AWS CLI

To delete an event window

Use the [delete-instance-event-window](#) command and specify the event window to delete.

```
aws ec2 delete-instance-event-window \  
--region us-east-1 \  
--instance-event-window-id iew-0abcdef1234567890
```

To force delete an event window

Use the `--force-delete` parameter if the event window is currently associated with targets.

```
aws ec2 delete-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--force-delete
```

Expected output

```
{  
    "InstanceEventWindowState": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "State": "deleting"  
    }  
}
```

Tag event windows

You can tag an event window when you create it, or afterwards.

To tag an event window when you create it, see [Create event windows](#).

Use one of the following methods to tag an event window.

Console

To tag an existing event window

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select the event window to tag, and then choose **Actions, Manage instance event window tags**.
5. Choose **Add tag** to add a tag. Repeat for each tag.
6. Choose **Save**.

AWS CLI

To tag an existing event window

Use the [create-tags](#) command to tag existing resources. In the following example, the existing event window is tagged with Key=purpose and Value=test.

```
aws ec2 create-tags \
--resources iew-0abcdef1234567890 \
--tags Key=purpose,Value=test
```

Monitor your instances using CloudWatch

You can monitor your instances using Amazon CloudWatch, which collects and processes raw data from Amazon EC2 into readable, near real-time metrics. These statistics are recorded for a period of 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing.

By default, Amazon EC2 sends metric data to CloudWatch in 5-minute periods. To send metric data for your instance to CloudWatch in 1-minute periods, you can enable detailed monitoring on the instance. For more information, see [Enable or turn off detailed monitoring for your instances](#).

The Amazon EC2 console displays a series of graphs based on the raw data from Amazon CloudWatch. Depending on your needs, you might prefer to get data for your instances from Amazon CloudWatch instead of the graphs in the console.

For Amazon CloudWatch billing and cost information, see [CloudWatch billing and cost](#) in the *Amazon CloudWatch User Guide*.

Contents

- [Amazon EC2 instance alarms](#)
- [Enable or turn off detailed monitoring for your instances](#)
- [List the available CloudWatch metrics for your instances](#)
- [Get statistics for metrics for your instances](#)
- [Graph metrics for your instances](#)
- [Create a CloudWatch alarm for an instance](#)
- [Create alarms that stop, terminate, reboot, or recover an instance](#)

Amazon EC2 instance alarms

You can view Amazon CloudWatch alarms for your instances on the **Instances** screen in the Amazon EC2 console.

Costs for ListMetrics API calls

For every 1,000 ListMetrics API requests, you might incur a \$0.01 cost, depending on whether you're still within the AWS Free Tier. Under the Free Tier, you get 1 million free CloudWatch API requests (excluding GetMetricData, GetInsightRuleReport, and GetMetricWidgetImage, which are always charged). For more information, see **Free Tier** on the [Amazon CloudWatch Pricing](#) page.

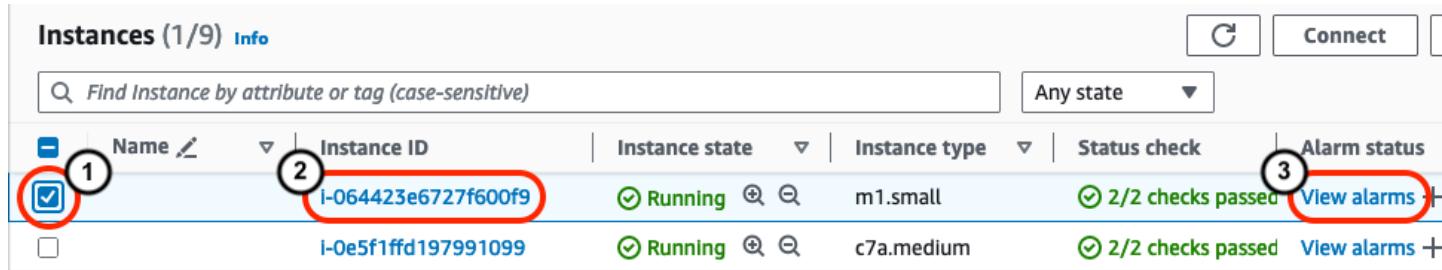

When you perform the following actions in the EC2 console, Amazon EC2 makes a CloudWatch ListMetrics API request:

- When you select the check box for an instance in the **Instances** table (indicated by **1** in the screenshot below).
- When you select an instance by choosing its ID in the **Instances** table (indicated by **2** in the screenshot below).
- When you choose **View alarms** in the **Instances** table to open the **Alarm details for i-1234567890example** window (indicated by **3** in the screenshot below).

Note

When you choose **View alarms**, the check box for the instance (indicated by **1** in the screenshot below) is automatically selected, which results in another ListMetrics API request.

The following screenshot indicates the console controls, numbered **1**, **2**, and **3**, that when selected, invoke the ListMetrics API.

Instances (1/9) Info					
<input type="text"/> Find Instance by attribute or tag (case-sensitive) Any state					
Name	Instance ID	Instance state	Instance type	Status check	Alarm status
<input checked="" type="checkbox"/>	i-064423e6727f600f9	Running Edit View	m1.small	2/2 checks passed	View alarms +
<input type="checkbox"/>	i-0e5f1ffd197991099	Running Edit View	c7a.medium	2/2 checks passed	View alarms +

Enable or turn off detailed monitoring for your instances

By default, your instance is enabled for **basic monitoring**. You can optionally enable **detailed monitoring**.

The following table highlights the differences between basic monitoring and detailed monitoring for instances.

Monitoring type	Description	Charges
Basic monitoring	Only status check metrics are available in 1-minute periods. All other metrics are available in 5-minute periods.	No charge.
Detailed monitoring	All metrics, including status check metrics, are available in 1-minute periods. To get this level of data, you must specifically enable it for the instance. For the instances where you've enabled detailed monitoring, you can also get aggregated data across groups of similar instances.	You are charged per metric that is sent to CloudWatch. You are not charged for data storage. For more information, see Paid tier and Example 1 - EC2 Detailed Monitoring on the Amazon CloudWatch pricing page .

Topics

- [Required IAM permissions](#)
- [Enable detailed monitoring](#)
- [Turn off detailed monitoring](#)

Required IAM permissions

To enable detailed monitoring for an instance, your user must have permission to use the [MonitorInstances](#) API action. To turn off detailed monitoring for an instance, your user must have permission to use the [UnmonitorInstances](#) API action.

Enable detailed monitoring

You can enable detailed monitoring on an instance as you launch it or after the instance is running or stopped. Enabling detailed monitoring on an instance does not affect the monitoring of the EBS volumes attached to the instance. For more information, see [Amazon CloudWatch metrics for Amazon EBS](#).

Console

To enable detailed monitoring for an existing instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage detailed monitoring**.
4. On the **Detailed monitoring** detail page, for **Detailed monitoring**, select the **Enable** check box.
5. Choose **Save**.

To enable detailed monitoring when launching an instance

When launching an instance using the Amazon EC2 console, under **Advanced details**, select the **Detailed CloudWatch monitoring** check box.

AWS CLI

To enable detailed monitoring for an existing instance

Use the following [monitor-instances](#) command to enable detailed monitoring for the specified instances.

```
aws ec2 monitor-instances --instance-ids i-1234567890abcdef0
```

To enable detailed monitoring when launching an instance

Use the [run-instances](#) command with the **--monitoring** flag to enable detailed monitoring.

```
aws ec2 run-instances --image-id ami-09092360 --monitoring Enabled=true...
```

Turn off detailed monitoring

You can turn off detailed monitoring on an instance as you launch it or after the instance is running or stopped.

Console

To turn off detailed monitoring

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage detailed monitoring**.
4. On the **Detailed monitoring** detail page, for **Detailed monitoring**, clear the **Enable** check box.
5. Choose **Save**.

AWS CLI

To turn off detailed monitoring

Use the following [unmonitor-instances](#) command to turn off detailed monitoring for the specified instances.

```
aws ec2 unmonitor-instances --instance-ids i-1234567890abcdef0
```

List the available CloudWatch metrics for your instances

Amazon EC2 sends metrics to Amazon CloudWatch. You can use the AWS Management Console, the AWS CLI, or an API to list the metrics that Amazon EC2 sends to CloudWatch. By default, each data point covers the 5 minutes that follow the start time of activity for the instance. If you've enabled detailed monitoring, each data point covers the next minute of activity from the start time. Note that for the Minimum, Maximum, and Average statistics, the minimum granularity for the metrics that EC2 provides is 1 minute.

For information about getting the statistics for these metrics, see [Get statistics for metrics for your instances](#).

Contents

Instance metrics

The AWS/EC2 namespace includes the following instance metrics.

Metric	Description	Unit	Meaningful statistics
CPUUtilization	<p>The percentage of physical CPU time that Amazon EC2 uses to run the EC2 instance, which includes time spent to run both the user code and the Amazon EC2 code.</p> <p>At a very high level, CPUUtilization is the sum of guest CPUUtilization and hypervisor CPUUtilization .</p> <p>Tools in your operating system can show a different percentage than CloudWatch due to factors such as legacy device simulation, configuration of non-legacy devices, interrupt-heavy workloads, live migration, and live update.</p>	Percent	<ul style="list-style-type: none">• Average• Minimum• Maximum

Metric	Description	Unit	Meaningful statistics
DiskReadOps	<p>Completed read operations from all instance store volumes available to the instance in a specified period of time.</p> <p>To calculate the average I/O operations per second (IOPS) for the period, divide the total operations in the period by the number of seconds in that period.</p> <p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p>	Count	<ul style="list-style-type: none"> • Sum • Average • Minimum • Maximum
DiskWriteOps	<p>Completed write operations to all instance store volumes available to the instance in a specified period of time.</p> <p>To calculate the average I/O operations per second (IOPS) for the period, divide the total operations in the period by the number of seconds in that period.</p> <p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p>	Count	<ul style="list-style-type: none"> • Sum • Average • Minimum • Maximum

Metric	Description	Unit	Meaningful statistics
DiskReadBytes	<p>Bytes read from all instance store volumes available to the instance.</p> <p>This metric is used to determine the volume of the data the application reads from the hard disk of the instance. This can be used to determine the speed of the application.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the bytes per second. For example, if you have graphed DiskReadBytes in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in bytes/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p> <p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p>	Bytes	<ul style="list-style-type: none"> Sum Average Minimum Maximum

Metric	Description	Unit	Meaningful statistics
DiskWrite Bytes	<p>Bytes written to all instance store volumes available to the instance.</p> <p>This metric is used to determine the volume of the data the application writes onto the hard disk of the instance. This can be used to determine the speed of the application.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the bytes per second. For example, if you have graphed DiskWrite Bytes in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in bytes/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p> <p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p>	Bytes	<ul style="list-style-type: none"> • Sum • Average • Minimum • Maximum

Metric	Description	Unit	Meaningful statistics
MetadataNoToken	<p>The number of times the Instance Metadata Service (IMDS) was successfully accessed using a method that does not use a token.</p> <p>This metric is used to determine if there are any processes accessing instance metadata that are using Instance Metadata Service Version 1 (IMDSv1), which does not use a token. If all requests use token-backed sessions, i.e., Instance Metadata Service Version 2 (IMDSv2), the value is 0. For more information, see Transition to using Instance Metadata Service Version 2.</p>	Count	<ul style="list-style-type: none"> Sum Percentiles
MetadataNoTokenRejected	<p>The number of times an IMDSv1 call was attempted after IMDSv1 was disabled.</p> <p>If this metric appears, it indicates that an IMDSv1 call was attempted and rejected. You can either re-enable IMDSv1 or make sure all of your calls use IMDSv2. For more information, see Transition to using Instance Metadata Service Version 2.</p>	Count	<ul style="list-style-type: none"> Sum Percentiles

Metric	Description	Unit	Meaningful statistics
NetworkIn	<p>The number of bytes received by the instance on all network interfaces. This metric identifies the volume of incoming network traffic to a single instance.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (5-minute) monitoring and the statistic is Sum, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring and the statistic is Sum, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the bytes per second. For example, if you have graphed NetworkIn in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in bytes/second. CPU credit metrics

The AWS/EC2 namespace includes the following CPU credit metrics for your [burstable performance instances](#).

Metric	Description	Unit	Meaningful statistics
CPUTCreditUsage	The number of CPU credits spent by the instance for CPU utilization. One CPU credit equals one vCPU running at 100% utilization for one minute or an equivalent combination	Credits (vCPU-minutes)	<ul style="list-style-type: none"> Sum Average Minimum Maximum

Metric	Description	Unit	Meaningful statistics
	<p>of vCPUs, utilization, and time (for example, one vCPU running at 50% utilization for two minutes or two vCPUs running at 25% utilization for two minutes).</p> <p>CPU credit metrics are available at a 5-minute frequency only. If you specify a period greater than five minutes, use the Sum statistic instead of the Average statistic.</p>		

Metric	Description	Unit	Meaningful statistics
CPUCreditBalance	<p>The number of earned CPU credits that an instance has accrued since it was launched or started. For T2 Standard, the CPUCreditBalance also includes the number of launch credits that have been accrued.</p> <p>Credits are accrued in the credit balance after they are earned, and removed from the credit balance when they are spent. The credit balance has a maximum limit, determined by the instance size. After the limit is reached, any new credits that are earned are discarded. For T2 Standard, launch credits do not count towards the limit.</p> <p>The credits in the CPUCreditBalance are available for the instance to spend to burst beyond its baseline CPU utilization.</p> <p>When an instance is running, credits in the CPUCreditBalance do not expire. When a T3 or T3a instance stops, the CPUCreditBalance value persists for seven days. Thereafter, all accrued credits are lost. When a T2 instance stops, the CPUCreditBalance value does not persist, and all accrued credits are lost.</p> <p>CPU credit metrics are available at a 5-minute frequency only.</p>	Credits (vCPU-minutes)	<ul style="list-style-type: none"> Sum Average Minimum Maximum

Metric	Description	Unit	Meaningful statistics
CPUSurplusCreditBalance	<p>The number of surplus credits that have been spent by an unlimited instance when its CPUCreditBalance value is zero.</p> <p>The CPUSurplusCreditBalance value is paid down by earned CPU credits. If the number of surplus credits exceeds the maximum number of credits that the instance can earn in a 24-hour period, the spent surplus credits above the maximum incur an additional charge.</p> <p>CPU credit metrics are available at a 5-minute frequency only.</p>	Credits (vCPU-minutes)	<ul style="list-style-type: none"> Sum Average Minimum Maximum
CPUSurplusCreditsCharged	<p>The number of spent surplus credits that are not paid down by earned CPU credits, and which thus incur an additional charge.</p> <p>Spent surplus credits are charged when any of the following occurs:</p> <ul style="list-style-type: none"> The spent surplus credits exceed the maximum number of credits that the instance can earn in a 24-hour period. Spent surplus credits above the maximum are charged at the end of the hour. The instance is stopped or terminated. The instance is switched from unlimited to standard. <p>CPU credit metrics are available at a 5-minute frequency only.</p>	Credits (vCPU-minutes)	<ul style="list-style-type: none"> Sum Average Minimum Maximum

Dedicated Host metrics

The AWS/EC2 namespace includes the following metrics for T3 Dedicated Hosts.

Metric	Description	Unit	Meaningful statistics
Dedicated HostCPUUtilization	The percentage of allocated compute capacity that is currently in use by the instances running on the Dedicated Host.	Percent	<ul style="list-style-type: none"> • Sum • Average • Minimum • Maximum

Amazon EBS metrics for Nitro-based instances

The AWS/EC2 namespace includes additional Amazon EBS metrics for volumes that are attached to Nitro-based instances that are not bare metal instances.

Metric	Description	Unit	Meaningful statistics
EBSReadOps	<p>Completed read operations from all Amazon EBS volumes attached to the instance in a specified period of time.</p> <p>To calculate the average read I/O operations per second (Read IOPS) for the period, divide the total operations in the period by the number of seconds in that period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to calculate the Read IOPS. If you have detailed (1-minute) monitoring, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the operations per second. For example, if you have graphed EBSReadOps in CloudWatch as m1, the</p>	Count	<ul style="list-style-type: none"> • Sum • Average • Minimum • Maximum

Metric	Description	Unit	Meaningful statistics
	<p>metric math formula $m1/(DIFF_TIME(m1))$</p> <p>returns the metric in operations/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p>		
EBSWriteOps	<p>Completed write operations to all EBS volumes attached to the instance in a specified period of time.</p> <p>To calculate the average write I/O operations per second (Write IOPS) for the period, divide the total operations in the period by the number of seconds in that period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to calculate the Write IOPS. If you have detailed (1-minute) monitoring, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the operations per second. For example, if you have graphed EBSWriteOps in CloudWatch as m1, the metric math formula $m1/(DIFF_TIME(m1))$</p> <p>returns the metric in operations/second. For information about the metrics provided for your EBS volumes, see [Metrics for Amazon EBS volumes](#) in the *Amazon EBS User Guide*. For information about the metrics provided for your Spot fleets, see [CloudWatch metrics for Spot Fleet](#).

Status check metrics

By default, status check metrics are available at a 1-minute frequency at no charge. For a newly-launched instance, status check metric data is only available after the instance has completed the initialization state (within a few minutes of the instance entering the `running` state). For more information about EC2 status checks, see [Status checks for your instances](#).

The AWS/EC2 namespace includes the following status check metrics.

Metric	Description	Unit	Meaningful statistics
StatusCheckFailed	<p>Reports whether the instance has passed both the instance status check and the system status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p>	Count	<ul style="list-style-type: none"> • Sum • Average

Metric	Description	Unit	Meaningful statistics
	<p>By default, this metric is available at a 1-minute frequency at no charge.</p>		
StatusCheckFailed_Instance	<p>Reports whether the instance has passed the instance status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p>	Count	<ul style="list-style-type: none"> • Sum • Average
StatusCheckFailed_System	<p>Reports whether the instance has passed the system status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p>	Count	<ul style="list-style-type: none"> • Sum • Average
StatusCheckFailed_AttachedEBS	<p>Reports whether the instance has passed the attached EBS status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p>	Count	<ul style="list-style-type: none"> • Sum • Average

The AWS/EBS namespace includes the following status check metric.

Metric	Description	Unit	Meaningful statistics
VolumeStalledIOCheck	<p>Note: For Nitro instances only. Not published for volumes attached to Amazon ECS and AWS Fargate tasks.</p> <p>Reports whether a volume has passed or failed a <i>stalled IO check</i> in the last minute. This metric can be either 0 (passed) or 1 (failed).</p>	Count	<ul style="list-style-type: none"> • Sum • Average • Minimum • Maximum

Traffic mirroring metrics

The AWS/EC2 namespace includes metrics for mirrored traffic. For more information, see [Monitor mirrored traffic using Amazon CloudWatch](#) in the *Amazon VPC Traffic Mirroring Guide*.

Auto Scaling group metrics

The AWS/AutoScaling namespace includes metrics for Auto Scaling groups. For more information, see [Monitor CloudWatch metrics for your Auto Scaling groups and instances](#) in the *Amazon EC2 Auto Scaling User Guide*.

Amazon EC2 metric dimensions

You can use the following dimensions to refine the metrics listed in the previous tables.

Dimension	Description
AutoScalingGroupName	This dimension filters the data you request for all instances in a specified capacity group. An <i>Auto Scaling group</i> is a collection of instances you define if you're using Auto Scaling. This dimension is available only for Amazon EC2 metrics when the instances are in such an Auto Scaling group. Available for instances with Detailed or Basic Monitoring enabled.
ImageId	This dimension filters the data you request for all instances running this Amazon EC2 Amazon Machine Image (AMI). Available for instances with Detailed Monitoring enabled.

Dimension	Description
InstanceId	This dimension filters the data you request for the identified instance only. This helps you pinpoint an exact instance from which to monitor data.
InstanceType	This dimension filters the data you request for all instances running with this specified instance type. This helps you categorize your data by the type of instance running. For example, you might compare data from an m1.small instance and an m1.large instance to determine which has the better business value for your application. Available for instances with Detailed Monitoring enabled.

Amazon EC2 usage metrics

You can use CloudWatch usage metrics to provide visibility into your account's usage of resources. Use these metrics to visualize your current service usage on CloudWatch graphs and dashboards.

Amazon EC2 usage metrics correspond to AWS service quotas. You can configure alarms that alert you when your usage approaches a service quota. For more information about CloudWatch integration with service quotas, see [AWS usage metrics in the Amazon CloudWatch User Guide](#).

Amazon EC2 publishes the following metrics in the AWS/Usage namespace.

Metric	Description
ResourceCount	The number of the specified resources running in your account. The resources are defined by the dimensions associated with the metric. The most useful statistic for this metric is MAXIMUM, which represents the maximum number of resources used during the 1-minute period.

The following dimensions are used to refine the usage metrics that are published by Amazon EC2.

Dimension	Description
Service	The name of the AWS service containing the resource. For Amazon EC2 usage metrics, the value for this dimension is EC2.
Type	The type of entity that is being reported. Currently, the only valid value for Amazon EC2 usage metrics is Resource.
Resource	The type of resource that is running. Currently, the only valid value for Amazon EC2 usage metrics is vCPU, which returns information on instances that are running.
Class	<p>The class of resource being tracked. For Amazon EC2 usage metrics with vCPU as the value of the Resource dimension, the valid values are Standard/OnDemand , F/OnDemand , G/OnDemand , Inf/OnDemand , P/OnDemand , and X/OnDemand .</p> <p>The values for this dimension define the first letter of the instance types that are reported by the metric. For example, Standard/OnDemand returns information about all running instances with types that start with A, C, D, H, I, M, R, T, and Z, and G/OnDemand returns information about all running instances with types that start with G.</p>

List metrics using the console

Metrics are grouped first by namespace, and then by the various dimension combinations within each namespace. For example, you can view all metrics provided by Amazon EC2, or metrics grouped by instance ID, instance type, image (AMI) ID, or Auto Scaling group.

To view available metrics by category (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** metric namespace.

The screenshot shows the AWS Metrics Explorer interface. At the top, there are three tabs: "All metrics" (highlighted in orange), "Graphed metrics", and "Graph options". Below the tabs is a search bar with the placeholder text "Search for any metric, dimension or resource id". The main area displays "722 Metrics" and lists them in a grid:

Service	Metrics
EBS	117 Metrics
EC2	316 Metrics
EFS	7 Metrics
ELB	210 Metrics
ElasticBeanstalk	8 Metrics
RDS	60 Metrics
S3	4 Metrics

4. Select a metric dimension (for example, **Per-Instance Metrics**).

The screenshot shows the Amazon CloudWatch Metrics console. At the top, there are three tabs: "All metrics" (selected), "Graphed metrics", and "Graph options". Below the tabs, the navigation bar shows "All > EC2". A search bar contains the placeholder text "Search for any metric, dimension or resource id". The main content area displays "103 Metrics" and is organized into five categories:

- By Auto Scaling Group**: 28 Metrics
- By Image (AMI) Id**: 7 Metrics
- Per-Instance Metrics**: 54 Metrics
- Aggregated by Instance Type**: 7 Metrics
- Across All Instances**: 7 Metrics

5. To sort the metrics, use the column heading. To graph a metric, select the check box next to the metric. To filter by resource, choose the resource ID and then choose **Add to search**. To filter by metric, choose the metric name and then choose **Add to search**.

The screenshot shows the AWS CloudWatch Metrics console. At the top, there are tabs for "All metrics", "Graphed metrics" (which is selected), and "Graph options". Below the tabs, the navigation path is "All > EC2 > Per-Instance Metrics". A search bar is present with the placeholder "Search for any metric, dimension or resource id". The main area is a table with three columns: "Instance Name (192)", "InstanceId", and "Metric Name". The table lists entries for "my-instance" instances, each with a unique InstanceId and a list of metrics like CPUUtilization, DiskReadBytes, etc. A context menu is open over the entry for InstanceId "i-abbc12a7". The menu items are: "Add to search", "Search for this only", "Add to graph", "Graph this metric only", "Graph all search results", and "Jump to resource". The "Jump to resource" option is highlighted with a checked checkbox.

List metrics using the AWS CLI

Use the [list-metrics](#) command to list the CloudWatch metrics for your instances.

To list all the available metrics for Amazon EC2 (AWS CLI)

The following example specifies the AWS/EC2 namespace to view all the metrics for Amazon EC2.

```
aws cloudwatch list-metrics --namespace AWS/EC2
```

The following is example output:

```
{
  "Metrics": [
    {
      "Namespace": "AWS/EC2",
      "Dimensions": [
        {
          "Name": "InstanceId",
          "Value": "i-1234567890abcdef0"
        }
      ]
    }
  ]
}
```

```
],
    "MetricName": "NetworkOut"
},
{
    "Namespace": "AWS/EC2",
    "Dimensions": [
        {
            "Name": "InstanceId",
            "Value": "i-1234567890abcdef0"
        }
    ],
    "MetricName": "CPUUtilization"
},
{
    "Namespace": "AWS/EC2",
    "Dimensions": [
        {
            "Name": "InstanceId",
            "Value": "i-1234567890abcdef0"
        }
    ],
    "MetricName": "NetworkIn"
},
...
]
```

To list all the available metrics for an instance (AWS CLI)

The following example specifies the AWS/EC2 namespace and the InstanceId dimension to view the results for the specified instance only.

```
aws cloudwatch list-metrics --namespace AWS/EC2 --dimensions
    Name=InstanceId,Value=i-1234567890abcdef0
```

To list a metric across all instances (AWS CLI)

The following example specifies the AWS/EC2 namespace and a metric name to view the results for the specified metric only.

```
aws cloudwatch list-metrics --namespace AWS/EC2 --metric-name CPUUtilization
```

Get statistics for metrics for your instances

You can get statistics for the CloudWatch metrics for your instances.

Contents

- [Statistics overview](#)
- [Get statistics for a specific instance](#)
- [Aggregate statistics across instances](#)
- [Aggregate statistics by Auto Scaling group](#)
- [Aggregate statistics by AMI](#)

Statistics overview

Statistics are metric data aggregations over specified periods of time. CloudWatch provides statistics based on the metric data points provided by your custom data or provided by other services in AWS to CloudWatch. Aggregations are made using the namespace, metric name, dimensions, and the data point unit of measure, within the time period you specify. The following table describes the available statistics.

Statistic	Description
Minimum	The lowest value observed during the specified period. You can use this value to determine low volumes of activity for your application.
Maximum	The highest value observed during the specified period. You can use this value to determine high volumes of activity for your application.
Sum	All values submitted for the matching metric added together. This statistic can be useful for determining the total volume of a metric.
Average	The value of Sum / SampleCount during the specified period. By comparing this statistic with the Minimum and Maximum, you can determine the full scope of a metric and how close the average use is to the Minimum and Maximum. This comparison helps you to know when to increase or decrease your resources as needed.

Statistic	Description
SampleCount	The count (number) of data points used for the statistical calculation.
pNN.NN	The value of the specified percentile. You can specify any percentile, using up to two decimal places (for example, p95.45).

Get statistics for a specific instance

The following examples show you how to use the AWS Management Console or the AWS CLI to determine the maximum CPU utilization of a specific EC2 instance.

Requirements

- You must have the ID of the instance. You can get the instance ID using the AWS Management Console or the [describe-instances](#) command.
- By default, basic monitoring is enabled, but you can enable detailed monitoring. For more information, see [Enable or turn off detailed monitoring for your instances](#).

To display the CPU utilization for a specific instance (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** metric namespace.

The screenshot shows the AWS CloudWatch Metrics console. At the top, there are three tabs: "All metrics" (highlighted in orange), "Graphed metrics", and "Graph options". Below the tabs is a search bar with the placeholder text "Search for any metric, dimension or resource id". The main area displays "722 Metrics" and lists them in a grid:

Service	Metrics
EBS	117 Metrics
EC2	316 Metrics
EFS	7 Metrics
ELB	210 Metrics
ElasticBeanstalk	8 Metrics
RDS	60 Metrics
S3	4 Metrics

4. Choose the **Per-Instance Metrics** dimension.

All metrics Graphed metrics Graph options

All > EC2 Search for any metric, dimension or resource id

103 Metrics

By Auto Scaling Group
28 Metrics

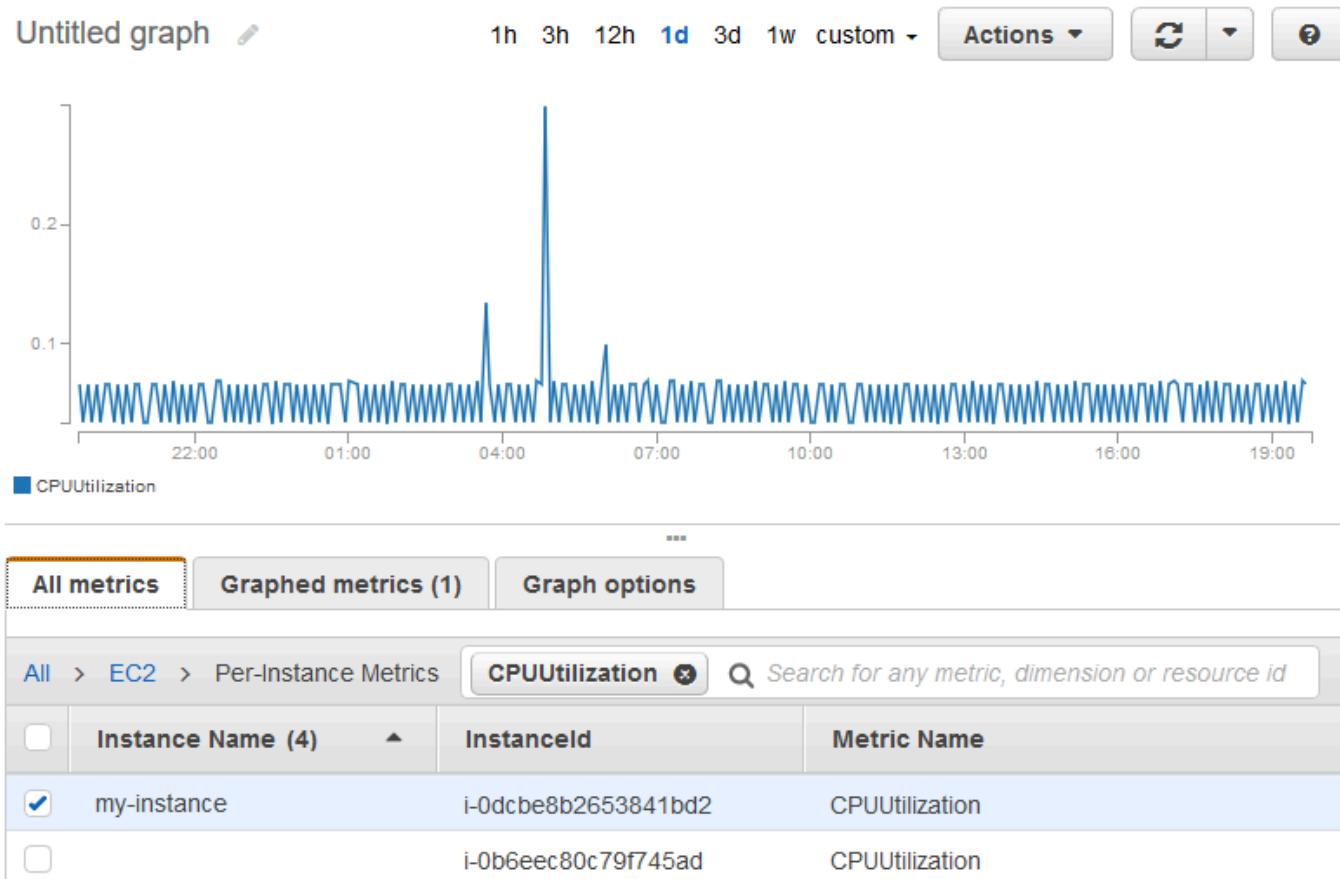

By Image (AMI) Id
7 Metrics

Per-Instance Metrics
54 Metrics

Aggregated by Instance Type
7 Metrics

Across All Instances
7 Metrics

5. In the search field, enter **CPUUtilization** and press Enter. Choose the row for the specific instance, which displays a graph for the **CPUUtilization** metric for the instance. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.

- To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

The screenshot shows the "Graphed metrics" tab selected in the AWS CloudWatch Metrics console. The table has columns for "Label", "Namespace", "Dimensions", "Metric Name", "Statistic", and "Period". The "Label" column contains "CPUUtilization". The "Namespace" column contains "EC2". The "Dimensions" column contains "Dimensions (1)". The "Metric Name" column contains "CPUUtilization". The "Statistic" column contains "Average". The "Period" column has a dropdown menu open, listing "1 Minute", "5 Minutes", "15 Minutes", "1 Hour", "6 Hours", and "1 Day".

To get the CPU utilization for a specific instance (AWS CLI)

Use the following [get-metric-statistics](#) command to get the **CPUUtilization** metric for the specified instance, using the specified period and time interval:

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name CPUUtilization  
--period 3600 \  
--statistics Maximum --dimensions Name=InstanceId,Value=i-1234567890abcdef0 \  
--start-time 2022-10-18T23:18:00 --end-time 2022-10-19T23:18:00
```

The following is example output. Each value represents the maximum CPU utilization percentage for a single EC2 instance.

```
{  
    "Datapoints": [  
        {  
            "Timestamp": "2022-10-19T00:18:00Z",  
            "Maximum": 0.3300000000000002,  
            "Unit": "Percent"  
        },  
        {  
            "Timestamp": "2022-10-19T03:18:00Z",  
            "Maximum": 99.67000000000002,  
            "Unit": "Percent"  
        },  
        {  
            "Timestamp": "2022-10-19T07:18:00Z",  
            "Maximum": 0.3400000000000002,  
            "Unit": "Percent"  
        },  
        {  
            "Timestamp": "2022-10-19T12:18:00Z",  
            "Maximum": 0.3400000000000002,  
            "Unit": "Percent"  
        },  
        ...  
    ],  
    "Label": "CPUUtilization"  
}
```

Aggregate statistics across instances

Aggregate statistics are available for instances that have detailed monitoring enabled. Instances that use basic monitoring are not included in the aggregates. Before you can get statistics

aggregated across instances, you must [enable detailed monitoring](#) (at an additional charge), which provides data in 1-minute periods.

Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

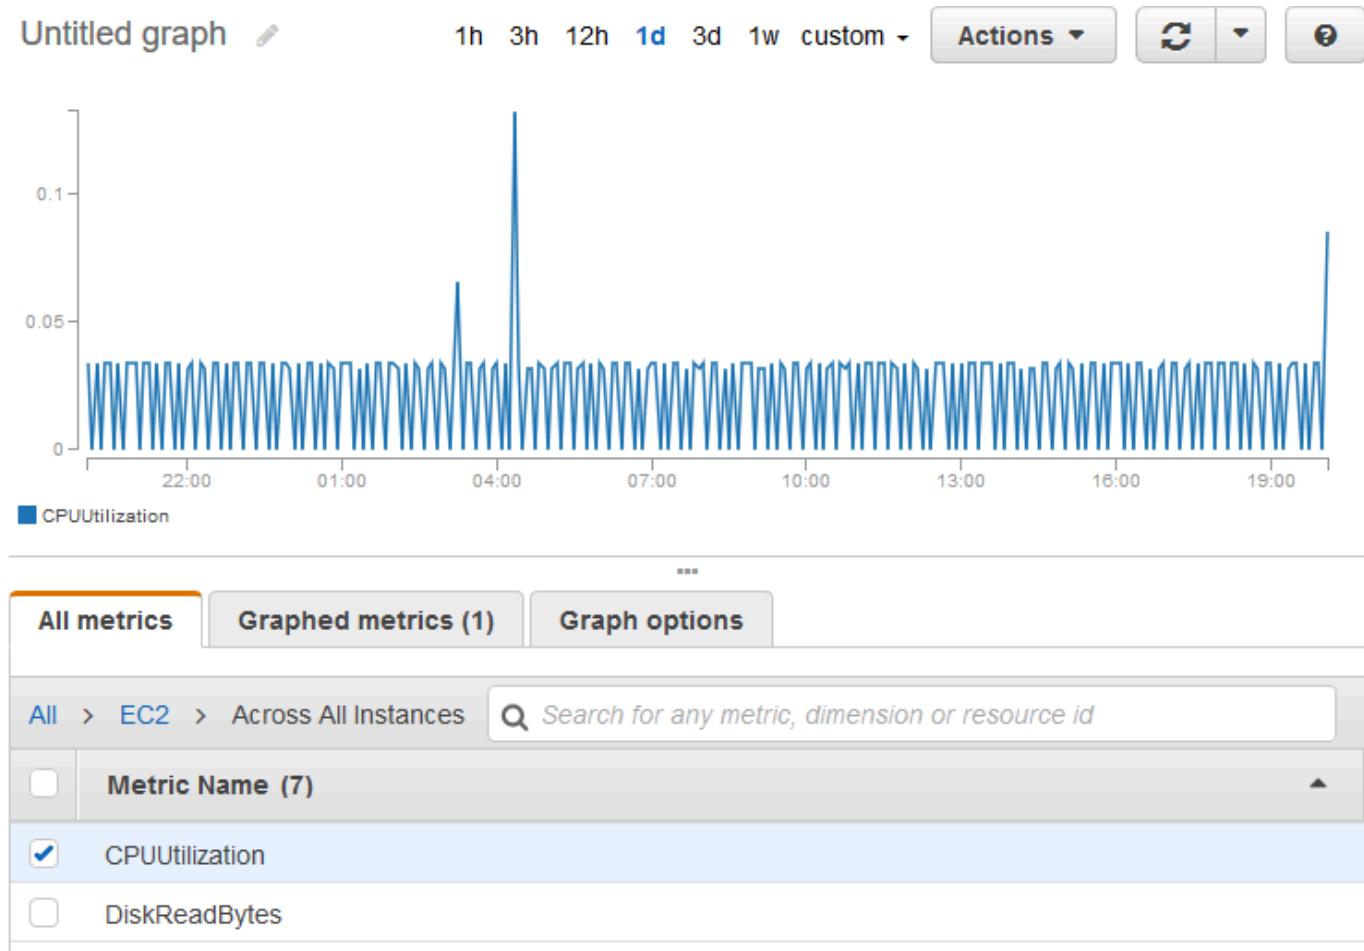

This example shows you how to use detailed monitoring to get the average CPU usage for your EC2 instances. Because no dimension is specified, CloudWatch returns statistics for all dimensions in the AWS/EC2 namespace.

⚠ Important

This technique for retrieving all dimensions across an AWS namespace does not work for custom namespaces that you publish to Amazon CloudWatch. With custom namespaces, you must specify the complete set of dimensions that are associated with any given data point to retrieve statistics that include the data point.

To display average CPU utilization across your instances (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and then choose **Across All Instances**.
4. Choose the row that contains **CPUUtilization**, which displays a graph for the metric for all your EC2 instances. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.

5. To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get average CPU utilization across your instances (AWS CLI)

Use the [get-metric-statistics](#) command as follows to get the average of the **CPUUtilization** metric across your instances.

```
aws cloudwatch get-metric-statistics \
--namespace AWS/EC2 \
--metric-name CPUUtilization \
--period 3600 --statistics "Average" "SampleCount" \
--start-time 2022-10-11T23:18:00 \
--end-time 2022-10-12T23:18:00
```

The following is example output:

```
{  
    "Datapoints": [  
        {  
            "SampleCount": 238.0,  
            "Timestamp": "2022-10-12T07:18:00Z",  
            "Average": 0.038235294117647062,  
            "Unit": "Percent"  
        },  
        {  
            "SampleCount": 240.0,  
            "Timestamp": "2022-10-12T09:18:00Z",  
            "Average": 0.1667083333333332,  
            "Unit": "Percent"  
        },  
        {  
            "SampleCount": 238.0,  
            "Timestamp": "2022-10-11T23:18:00Z",  
            "Average": 0.041596638655462197,  
            "Unit": "Percent"  
        },  
        ...  
    ],  
    "Label": "CPUUtilization"  
}
```

Aggregate statistics by Auto Scaling group

You can aggregate statistics for the EC2 instances in an Auto Scaling group. Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

This example shows you how to retrieve the total bytes written to disk for one Auto Scaling group. The total is computed for 1-minute periods for a 24-hour interval across all EC2 instances in the specified Auto Scaling group.

To display DiskWriteBytes for the instances in an Auto Scaling group (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and then choose **By Auto Scaling Group**.

4. Choose the row for the **DiskWriteBytes** metric and the specific Auto Scaling group, which displays a graph for the metric for the instances in the Auto Scaling group. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.
5. To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To display DiskWriteBytes for the instances in an Auto Scaling group (AWS CLI)

Use the [get-metric-statistics](#) command as follows.

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name DiskWriteBytes  
--period 360 \  
--statistics "Sum" "SampleCount" --dimensions Name=AutoScalingGroupName,Value=my-asg --  
start-time 2022-10-16T23:18:00 --end-time 2022-10-18T23:18:00
```

The following is example output:

```
{  
    "Datapoints": [  
        {  
            "SampleCount": 18.0,  
            "Timestamp": "2022-10-19T21:36:00Z",  
            "Sum": 0.0,  
            "Unit": "Bytes"  
        },  
        {  
            "SampleCount": 5.0,  
            "Timestamp": "2022-10-19T21:42:00Z",  
            "Sum": 0.0,  
            "Unit": "Bytes"  
        }  
    ],  
    "Label": "DiskWriteBytes"  
}
```

Aggregate statistics by AMI

You can aggregate statistics for your instances that have detailed monitoring enabled. Instances that use basic monitoring are not included in the aggregates. Before you can get statistics

aggregated across instances, you must [enable detailed monitoring](#) (at an additional charge), which provides data in 1-minute periods.

Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

This example shows you how to determine average CPU utilization for all instances that use a specific Amazon Machine Image (AMI). The average is over 60-second time intervals for a one-day period.

To display the average CPU utilization by AMI (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and then choose **By Image (AMI) Id**.
4. Choose the row for the **CPUUtilization** metric and the specific AMI, which displays a graph for the metric for the specified AMI. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.
5. To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get the average CPU utilization for an image ID (AWS CLI)

Use the [get-metric-statistics](#) command as follows.

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name CPUUtilization  
--period 3600 \  
--statistics Average --dimensions Name=ImageId,Value=ami-3c47a355 --start-  
time 2022-10-10T00:00:00 --end-time 2022-10-11T00:00:00
```

The following is example output. Each value represents an average CPU utilization percentage for the EC2 instances running the specified AMI.

```
{  
    "Datapoints": [  
        {  
            "Timestamp": "2022-10-10T07:00:00Z",  
            "Average": 0.04100000000000009,  
            "Unit": "Percent"
```

```
        },
        {
            "Timestamp": "2022-10-10T14:00:00Z",
            "Average": 0.079579831932773085,
            "Unit": "Percent"
        },
        {
            "Timestamp": "2022-10-10T06:00:00Z",
            "Average": 0.036000000000000011,
            "Unit": "Percent"
        },
        ...
    ],
    "Label": "CPUUtilization"
}
```

Graph metrics for your instances

After you launch an instance, you can open the Amazon EC2 console and view the monitoring graphs for the instance on the **Monitoring** tab. Each graph is based on one of the available Amazon EC2 metrics.

The following graphs are available:

- Average CPU Utilization (Percent)
- Average Disk Reads (Bytes)
- Average Disk Writes (Bytes)
- Maximum Network In (Bytes)
- Maximum Network Out (Bytes)
- Summary Disk Read Operations (Count)
- Summary Disk Write Operations (Count)
- Summary Status (Any)
- Summary Status Instance (Count)
- Summary Status System (Count)

For more information about the metrics and the data they provide to the graphs, see [List the available CloudWatch metrics for your instances](#).

Graph metrics using the CloudWatch console

You can also use the CloudWatch console to graph metric data generated by Amazon EC2 and other AWS services. For more information, see [Graphing metrics](#) in the *Amazon CloudWatch User Guide*.

Create a CloudWatch alarm for an instance

You can create a CloudWatch alarm that monitors CloudWatch metrics for one of your instances. CloudWatch will automatically send you a notification when the metric reaches a threshold you specify. You can create a CloudWatch alarm using the Amazon EC2 console, or using the more advanced options provided by the CloudWatch console.

To create an alarm using the CloudWatch console

For examples, see [Creating Amazon CloudWatch Alarms](#) in the *Amazon CloudWatch User Guide*.

To create an alarm using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.
4. On the **Manage CloudWatch alarms** detail page, under **Add or edit alarm**, select **Create an alarm**.
5. For **Alarm notification**, choose whether to configure Amazon Simple Notification Service (Amazon SNS) notifications. Enter an existing Amazon SNS topic or enter a name to create a new topic.
6. For **Alarm action**, choose whether to specify an action to take when the alarm is triggered. Choose an action from the list.
7. For **Alarm thresholds**, select the metric and criteria for the alarm. For example, to create an alarm that is triggered when CPU utilization reaches 80% for a 5 minute period, do the following:
 - a. Keep the default setting for **Group samples by (Average)** and **Type of data to sample (CPU utilization)**.
 - b. Choose **>=** for **Alarm when** and enter **0.80** for **Percent**.
 - c. Enter **1** for **Consecutive period** and select **5 minutes** for **Period**.

8. (Optional) For **Sample metric data**, choose **Add to dashboard**.

9. Choose **Create**.

You can edit your CloudWatch alarm settings from the Amazon EC2 console or the CloudWatch console. If you want to delete your alarm, you can do so from the CloudWatch console. For more information, see [Editing or deleting a CloudWatch alarm](#) in the *Amazon CloudWatch User Guide*.

Create alarms that stop, terminate, reboot, or recover an instance

Using Amazon CloudWatch alarm actions, you can create alarms that automatically stop, terminate, reboot, or recover your instances. You can use the stop or terminate actions to help you save money when you no longer need an instance to be running. You can use the reboot and recover actions to automatically reboot those instances or recover them onto new hardware if a system impairment occurs.

Note

For Amazon CloudWatch alarms billing and pricing information, see [CloudWatch billing and cost](#) in the *Amazon CloudWatch User Guide*.

The `AWSLambdaRoleForCloudWatchEvents` service-linked role enables AWS to perform alarm actions on your behalf. The first time you create an alarm in the AWS Management Console, the AWS CLI, or the IAM API, CloudWatch creates the service-linked role for you.

There are a number of scenarios in which you might want to automatically stop or terminate your instance. For example, you might have instances dedicated to batch payroll processing jobs or scientific computing tasks that run for a period of time and then complete their work. Rather than letting those instances sit idle (and accrue charges), you can stop or terminate them, which can help you to save money. The main difference between using the stop and the terminate alarm actions is that you can easily start a stopped instance if you need to run it again later, and you can keep the same instance ID and root volume. However, you cannot start a terminated instance. Instead, you must launch a new instance. When an instance is stopped or terminated, data on instance store volumes is lost.

You can add the stop, terminate, reboot, or recover actions to any alarm that is set on an Amazon EC2 per-instance metric, including basic and detailed monitoring metrics provided by Amazon

CloudWatch (in the AWS/EC2 namespace), as well as any custom metrics that include the InstanceId dimension, as long as its value refers to a valid running Amazon EC2 instance.

Console support

You can create alarms using the Amazon EC2 console or the CloudWatch console. The procedures in this documentation use the Amazon EC2 console. For procedures that use the CloudWatch console, see [Create alarms that stop, terminate, reboot, or recover an instance](#) in the *Amazon CloudWatch User Guide*.

Permissions

You must have the `iam:CreateServiceLinkedRole` to create or modify an alarm that performs EC2 alarm actions. A service role is an [IAM role](#) that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see [Creating a role to delegate permissions to an AWS service](#) in the *IAM User Guide*.

Contents

- [Add stop actions to Amazon CloudWatch alarms](#)
- [Add terminate actions to Amazon CloudWatch alarms](#)
- [Add reboot actions to Amazon CloudWatch alarms](#)
- [Add recover actions to Amazon CloudWatch alarms](#)
- [Use the Amazon CloudWatch console to view alarm and action history](#)
- [Amazon CloudWatch alarm action scenarios](#)

Add stop actions to Amazon CloudWatch alarms

You can create an alarm that stops an Amazon EC2 instance when a certain threshold has been met. For example, you may run development or test instances and occasionally forget to shut them off. You can create an alarm that is triggered when the average CPU utilization percentage has been lower than 10 percent for 24 hours, signaling that it is idle and no longer in use. You can adjust the threshold, duration, and period to suit your needs, plus you can add an Amazon Simple Notification Service (Amazon SNS) notification so that you receive an email when the alarm is triggered.

Instances that use an Amazon EBS volume as the root device can be stopped or terminated, whereas instances that use the instance store as the root device can only be terminated. Data on instance store volumes is lost when the instance is terminated or stopped.

To create an alarm to stop an idle instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

Alternatively, you can choose the plus sign (

) in the **Alarm status** column.

4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
 - c. Toggle on **Alarm action**, and choose **Stop**.
 - d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **CPU utilization**.
 - e. For **Alarm When** and **Percent**, specify the metric threshold. In this example, specify **<=** and **10 percent**.
 - f. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, specify **1 consecutive period of 5 Minutes**.
 - g. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.

Note

You can adjust the alarm configuration based on your own requirements before creating the alarm, or you can edit them later. This includes the metric, threshold,

duration, action, and notification settings. However, after you create an alarm, you cannot edit its name later.

- h. Choose **Create**.

Add terminate actions to Amazon CloudWatch alarms

You can create an alarm that terminates an EC2 instance automatically when a certain threshold has been met (as long as termination protection is not enabled for the instance). For example, you might want to terminate an instance when it has completed its work, and you don't need the instance again. If you might want to use the instance later, you should stop the instance instead of terminating it. Data on instance store volumes is lost when the instance is terminated. For information about enabling and disabling termination protection for an instance, see [Enable termination protection](#).

To create an alarm to terminate an idle instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

Alternatively, you can choose the plus sign (

) in the **Alarm status** column.

4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
 - c. Toggle on **Alarm action**, and choose **Terminate**.
 - d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **CPU utilization**.

- e. For **Alarm When** and **Percent**, specify the metric threshold. In this example, specify => and **10** percent.
- f. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, specify **24** consecutive periods of **1 Hour**.
- g. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.

 **Note**

You can adjust the alarm configuration based on your own requirements before creating the alarm, or you can edit them later. This includes the metric, threshold, duration, action, and notification settings. However, after you create an alarm, you cannot edit its name later.

- h. Choose **Create**.

Add reboot actions to Amazon CloudWatch alarms

You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically reboots the instance. The reboot alarm action is recommended for Instance Health Check failures (as opposed to the recover alarm action, which is suited for System Health Check failures). An instance reboot is equivalent to an operating system reboot. In most cases, it takes only a few minutes to reboot your instance. When you reboot an instance, it remains on the same physical host, so your instance keeps its public DNS name, private IP address, and any data on its instance store volumes.

Rebooting an instance doesn't start a new instance billing period (with a minimum one-minute charge), unlike stopping and restarting your instance. Data on instance store volumes is retained when the instance is rebooted. The instance store volumes must be re-mounted into the filesystem after a reboot. For more information, see [Reboot your instance](#).

 **Important**

To avoid a race condition between the reboot and recover actions, avoid setting the same number of evaluation periods for a reboot alarm and a recover alarm. We recommend that you set reboot alarms to three evaluation periods of one minute each. For more information, see [Evaluating an alarm](#) in the *Amazon CloudWatch User Guide*.

To create an alarm to reboot an instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

Alternatively, you can choose the plus sign (+) in the **Alarm status** column.
4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
 - c. Toggle on **Alarm action**, and choose **Reboot**.
 - d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **Status check failed: instance**.
 - e. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, enter **3 consecutive periods of 5 Minutes**.
 - f. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.
 - g. Choose **Create**.

Add recover actions to Amazon CloudWatch alarms

You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance. If the instance becomes impaired due to an underlying hardware failure or a problem that requires AWS involvement to repair, you can automatically recover the instance. Terminated instances cannot be recovered. A recovered instance is identical to the original instance, including the instance ID, private IP addresses, Elastic IP addresses, and all instance metadata.

CloudWatch prevents you from adding a recovery action to an alarm that is on an instance which does not support recovery actions.

When the StatusCheckFailed_System alarm is triggered, and the recover action is initiated, you are notified by the Amazon SNS topic that you chose when you created the alarm and associated the recover action. During instance recovery, the instance is migrated during an instance reboot, and any data that is in-memory is lost. When the process is complete, information is published to the SNS topic you've configured for the alarm. Anyone who is subscribed to this SNS topic receives an email notification that includes the status of the recovery attempt and any further instructions. You notice an instance reboot on the recovered instance.

 **Note**

The recover action can be used only with StatusCheckFailed_System, not with StatusCheckFailed_Instance.

The following problems can cause system status checks to fail:

- Loss of network connectivity
- Loss of system power
- Software issues on the physical host
- Hardware issues on the physical host that impact network reachability

The recover action is supported only on instances that meet certain characteristics. For more information, see [Recover your instance](#).

If your instance has a public IP address, it retains the public IP address after recovery.

 **Important**

To avoid a race condition between the reboot and recover actions, avoid setting the same number of evaluation periods for a reboot alarm and a recover alarm. We recommend that you set recover alarms to two evaluation periods of one minute each. For more information, see [Evaluating an alarm](#) in the *Amazon CloudWatch User Guide*.

To create an alarm to recover an instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

Alternatively, you can choose the plus sign (

) in the **Alarm status** column.

4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.

Note

Users must subscribe to the specified SNS topic to receive email notifications when the alarm is triggered. The AWS account root user always receives email notifications when automatic instance recovery actions occur, even if an SNS topic is not specified or the root user is not subscribed to the specified SNS topic.

- c. Toggle on **Alarm action**, and choose **Recover**.
- d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **Status check failed: system**.
- e. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, enter 2 consecutive periods of **5 Minutes**.
- f. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.
- g. Choose **Create**.

Use the Amazon CloudWatch console to view alarm and action history

You can view alarm and action history in the Amazon CloudWatch console. Amazon CloudWatch keeps the last two weeks' worth of alarm and action history.

To view the history of triggered alarms and actions (CloudWatch console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**.
3. Select an alarm.
4. The **Details** tab shows the most recent state transition along with the time and metric values.
5. Choose the **History** tab to view the most recent history entries.

Amazon CloudWatch alarm action scenarios

You can use the Amazon EC2 console to create alarm actions that stop or terminate an Amazon EC2 instance when certain conditions are met. In the following screen capture of the console page where you set the alarm actions, we've numbered the settings. We've also numbered the settings in the scenarios that follow, to help you create the appropriate actions.

New console

Alarm notification Info (1)

Configure the alarm to send notifications to an Amazon SNS topic when it is triggered.

Choose an existing topic or enter a name to create a new topic

Alarm action Info (2)

Specify the action to take when the alarm is triggered.

Selection action to alarm fires

Alarm thresholds

Specify the metric thresholds for the alarm.

Old console

Create Alarm

You can use CloudWatch alarms to be notified automatically whenever metric data reaches a level you define. To edit an alarm, first choose whom to notify and then define when the notification should be sent.

Send a notification to: [create topic](#)

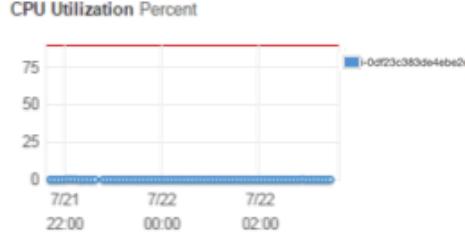

Take the action: Recover this instance [i](#)
 Stop this instance [i](#)
 Terminate this instance [i](#)
 Reboot this instance [i](#)

Whenever: of
Is: Percent

For at least: consecutive period(s) of

Name of alarm:

[Cancel](#) [Create Alarm](#)

Scenario 1: Stop idle development and test instances

Create an alarm that stops an instance used for software development or testing when it has been idle for at least an hour.

Setting	Value
1	Stop
2	Maximum
3	CPU Utilization
4	<=
5	10%
6	1
7	1 Hour

Scenario 2: Stop idle instances

Create an alarm that stops an instance and sends an email when the instance has been idle for 24 hours.

Setting	Value
1	Stop and email
2	Average
3	CPU Utilization
4	<=
5	5%
6	24
7	1 Hour

Scenario 3: Send email about web servers with unusually high traffic

Create an alarm that sends email when an instance exceeds 10 GB of outbound network traffic per day.

Setting	Value
1	Email
2	Sum
3	Network Out
4	>
5	10 GB
6	24

Setting	Value
7	1 Hour

Scenario 4: Stop web servers with unusually high traffic

Create an alarm that stops an instance and send a text message (SMS) if outbound traffic exceeds 1 GB per hour.

Setting	Value
1	Stop and send SMS
2	Sum
3	Network Out
4	>
5	1 GB
6	1
7	1 Hour

Scenario 5: Stop an impaired instance

Create an alarm that stops an instance that fails three consecutive status checks (performed at 5-minute intervals).

Setting	Value
1	Stop
2	Average

Automate Amazon EC2 using EventBridge

You can use Amazon EventBridge to automate your AWS services and respond automatically to system events, such as application availability issues or resource changes. Events from AWS services are delivered to EventBridge in near real time. You can create rules to indicate which events you're interested in, and the actions to take when an event matches a rule. The actions that can be automatically triggered include the following:

- Invoke an AWS Lambda function

- Invoke Amazon EC2 Run Command
- Relay the event to Amazon Kinesis Data Streams
- Activate an AWS Step Functions state machine
- Notify an Amazon SNS topic
- Notify an Amazon SQS queue

The following are examples of how you can use EventBridge with Amazon EC2:

- Activate a Lambda function whenever an instance enters the running state.
- Notify an Amazon SNS topic when an Amazon EBS volume is created or modified.
- Send a command to one or more Amazon EC2 instances using Amazon EC2 Run Command whenever a certain event in another AWS service occurs.

For more information, see the [Amazon EventBridge User Guide](#).

Amazon EC2 event types

Amazon EC2 supports the following event types:

- [EC2 AMI State Change](#)
- [EC2 Fast Launch State-change Notification](#)
- [EC2 Fleet Error](#)
- [EC2 Fleet Information](#)
- [EC2 Fleet Instance Change](#)
- [EC2 Fleet Spot Instance Request Change](#)
- [EC2 Fleet State Change](#)
- [EC2 Instance Rebalance Recommendation](#)
- [EC2 Instance State-change Notification](#)
- [EC2 Spot Fleet Error](#)
- [EC2 Spot Fleet Information](#)
- [EC2 Spot Fleet Instance Change](#)
- [EC2 Spot Fleet Spot Instance Request Change](#)

- [EC2 Spot Fleet State Change](#)
- [EC2 Spot Instance Interruption Warning](#)
- [EC2 Spot Instance Request Fulfillment](#)
- [EC2 ODCR Underutilization Notification](#)

For information about the event types supported by Amazon EBS, see [EventBridge for Amazon EBS](#).

Log Amazon EC2 and Amazon EBS API calls with AWS CloudTrail

Amazon EC2 and Amazon EBS are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2 and Amazon EBS. CloudTrail captures all API calls for Amazon EC2 and Amazon EBS as events, including calls from the console and from code calls to the APIs. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for Amazon EC2 and Amazon EBS. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in **Event history**. Using the information collected by CloudTrail, you can determine the request that was made to Amazon EC2 and Amazon EBS, the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, see the [AWS CloudTrail User Guide](#).

Amazon EC2 and Amazon EBS information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in Amazon EC2 and Amazon EBS, that activity is recorded in a CloudTrail event along with other AWS service events in **Event history**. You can view, search, and download recent events in your AWS account. For more information, see [Viewing events with CloudTrail Event history](#).

For an ongoing record of events in your AWS account, including events for Amazon EC2 and Amazon EBS, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see:

- [Creating a trail for your AWS account](#)
- [AWS service integrations with CloudTrail logs](#)
- [Configuring Amazon SNS notifications for CloudTrail](#)
- [Receiving CloudTrail log files from multiple Regions](#) and [Receiving CloudTrail log files from multiple accounts](#)

All Amazon EC2 actions, and Amazon EBS management actions, are logged by CloudTrail and are documented in the [Amazon EC2 API Reference](#). For example, calls to the [RunInstances](#), [DescribeInstances](#), or [CreateImage](#) actions generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root user or IAM user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the [CloudTrail userIdentity element](#).

Understand Amazon EC2 and Amazon EBS log file entries

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files are not an ordered stack trace of the public API calls, so they do not appear in any specific order.

The following log file record shows that a user terminated an instance.

```
{  
  "Records": [  
    {  
      "eventVersion": "1.03",  
      "userIdentity": {  
        "type": "Root",

```

Use AWS CloudTrail to audit users that connect via EC2 Instance Connect

Use AWS CloudTrail to audit the users that connect to your instances via EC2 Instance Connect.

To audit SSH activity via EC2 Instance Connect using the AWS CloudTrail console

1. Open the AWS CloudTrail console at <https://console.aws.amazon.com/cloudtrail/>.
2. Verify that you are in the correct Region.
3. In the navigation pane, choose **Event history**.
4. For **Filter**, choose **Event source, ec2-instance-connect.amazonaws.com**.
5. (Optional) For **Time range**, select a time range.
6. Choose the **Refresh events** icon.
7. The page displays the events that correspond to the [SendSSHPublicKey](#) API calls. Expand an event using the arrow to view additional details, such as the user name and AWS access key that was used to make the SSH connection, and the source IP address.
8. To display the full event information in JSON format, choose **View event**. The **requestParameters** field contains the destination instance ID, OS user name, and public key that were used to make the SSH connection.

```
{  
    "eventVersion": "1.05",  
    "userIdentity": {  
        "type": "IAMUser",  
        "principalId": "ABCDEFGONGNOM00CB6XYTQEXAMPLE",  
        "arn": "arn:aws:iam::1234567890120:user/IAM-friendly-name",  
        "accountId": "123456789012",  
        "accessKeyId": "ABCDEFGHIJKLMNOPTQRSTUVWXYZEXAMPLE",  
        "userName": "IAM-friendly-name",  
        "sessionContext": {  
            "attributes": {  
                "mfaAuthenticated": "false",  
                "creationDate": "2018-09-21T21:37:58Z"}  
        }  
    },  
    "eventTime": "2018-09-21T21:38:00Z",  
    "eventSource": "ec2-instance-connect.amazonaws.com",  
    "eventName": "SendSSHPublicKey ",  
    "awsRegion": "us-west-2",  
    "sourceIPAddress": "123.456.789.012",  
    "userAgent": "aws-cli/1.15.61 Python/2.7.10 Darwin/16.7.0 botocore/1.10.60",  
    "requestParameters": {  
        "instanceId": "i-0123456789EXAMPLE",  
        "osUser": "ec2-user",  
        "SSHKey": {
```

```
        "publicKey": "ssh-rsa ABCDEFGHIJKLMNOP001234567890EXAMPLE"
    },
    "responseElements": null,
    "requestID": "1a2s3d4f-bde6-11e8-a892-f7ec64543add",
    "eventID": "1a2w3d4r5-a88f-4e28-b3bf-30161f75be34",
    "eventType": "AwsApiCall",
    "recipientAccountId": "0987654321"
}
```

If you have configured your AWS account to collect CloudTrail events in an S3 bucket, you can download and audit the information programmatically. For more information, see [Getting and viewing your CloudTrail log files](#) in the *AWS CloudTrail User Guide*.

Monitor your .NET and SQL Server applications with CloudWatch Application Insights

CloudWatch Application Insights helps you monitor your .NET and SQL Server applications that use Amazon EC2 instances along with other [AWS application resources](#). It identifies and sets up key metrics logs, and alarms across your application resources and technology stack (for example, your Microsoft SQL Server database, web (IIS) and application servers, OS, load balancers, and queues). It continuously monitors the metrics and logs to detect and correlate anomalies and errors. When errors and anomalies are detected, Application Insights generates [CloudWatch Events](#) that you can use to set up notifications or take actions. To aid with troubleshooting, it creates automated dashboards for the detected problems, which include correlated metric anomalies and log errors, along with additional insights to point you to the potential root cause. The automated dashboards help you to take swift remedial actions to keep your applications healthy and to prevent impact to the end users of your application.

To view a complete list of supported logs and metrics, see [Logs and Metrics Supported by Amazon CloudWatch Application Insights](#).

Information provided about detected problems:

- A short summary of the problem
- The start time and date of the problem
- The problem severity: High/Medium/Low
- The status of the detected problem: In-progress/Resolved

- Insights: Automatically generated insights on the detected problem and possible root cause
- Feedback on insights: Feedback you have provided about the usefulness of the insights generated by CloudWatch Application Insights for .NET and SQL Server
- Related observations: A detailed view of the metric anomalies and error snippets of relevant logs related to the problem across various application components

Feedback

You can provide feedback on automatically generated insights on detected problems by designating them useful or not useful. Your feedback on the insights, along with your application diagnostics (metric anomalies and log exceptions), are used to improve the future detection of similar problems.

For more information, see the [CloudWatch Application Insights](#) documentation in the *Amazon CloudWatch User Guide*.

Networking in Amazon EC2

Amazon VPC enables you to launch AWS resources, such as Amazon EC2 instances, into a virtual network dedicated to your AWS account, known as a virtual private cloud (VPC). When you launch an instance, you can select a subnet from the VPC. The instance is configured with a primary network interface, which is a logical virtual network card. The instance receives a primary private IP address from the IPv4 address of the subnet, and it is assigned to the primary network interface.

You can control whether the instance receives a public IP address from Amazon's pool of public IP addresses. The public IP address of an instance is associated with your instance only until it is stopped or terminated. If you require a persistent public IP address, you can allocate an Elastic IP address for your AWS account and associate it with an instance or a network interface. An Elastic IP address remains associated with your AWS account until you release it, and you can move it from one instance to another as needed. You can bring your own IP address range to your AWS account, where it appears as an address pool, and then allocate Elastic IP addresses from your address pool.

To increase network performance and reduce latency, you can launch instances in a placement group. You can get significantly higher packet per second (PPS) performance using enhanced networking. You can accelerate high performance computing and machine learning applications using an Elastic Fabric Adapter (EFA), which is a network device that you can attach to a supported instance type.

Features

- [Regions and Zones](#)
- [Amazon EC2 instance IP addressing](#)
- [Amazon EC2 instance hostname types](#)
- [Bring your own IP addresses \(BYOIP\) in Amazon EC2](#)
- [Elastic IP addresses](#)
- [Elastic network interfaces](#)
- [Amazon EC2 instance network bandwidth](#)
- [Enhanced networking on Windows](#)
- [Amazon EC2 instance topology](#)
- [Placement groups](#)
- [Network maximum transmission unit \(MTU\) for your EC2 instance](#)

- [Virtual private clouds](#)
- [Ports and Protocols for Windows Amazon Machine Images \(AMIs\)](#)

Regions and Zones

Amazon EC2 is hosted in multiple locations world-wide. These locations are composed of AWS Regions, Availability Zones, Local Zones, AWS Outposts, and Wavelength Zones.

- Each Region is a separate geographic area.
- Availability Zones are multiple, isolated locations within each Region.
- Local Zones provide you the ability to place resources, such as compute and storage, in multiple locations closer to your end users.
- AWS Outposts brings native AWS services, infrastructure, and operating models to virtually any data center, co-location space, or on-premises facility.
- Wavelength Zones allow developers to build applications that deliver ultra-low latencies to 5G devices and end users. Wavelength deploys standard AWS compute and storage services to the edge of telecommunication carriers' 5G networks.

AWS operates state-of-the-art, highly available data centers. Although rare, failures can occur that affect the availability of instances that are in the same location. If you host all of your instances in a single location that is affected by a failure, none of your instances would be available.

To help you determine which deployment is best for you, see [AWS Wavelength FAQs](#).

Contents

- [Regions](#)
- [Availability Zones](#)
- [Local Zones](#)
- [Wavelength Zones](#)
- [AWS Outposts](#)

Regions

Each Region is designed to be isolated from the other Regions. This achieves the greatest possible fault tolerance and stability.

When you view your resources, you see only the resources that are tied to the Region that you specified. This is because Regions are isolated from each other, and we don't automatically replicate resources across Regions.

When you launch an instance, you must select an AMI that's in the same Region. If the AMI is in another Region, you can copy the AMI to the Region you're using. For more information, see [Copy an AMI](#).

Note that there is a charge for data transfer between Regions. For more information, see [Amazon EC2 Pricing - Data Transfer](#).

Contents

- [Available Regions](#)
- [Regions and endpoints](#)
- [Describe your Regions](#)
- [Get the Region display name](#)
- [Specify the Region for a resource](#)

Available Regions

Your account determines the Regions that are available to you.

- An AWS account provides multiple Regions so that you can launch Amazon EC2 instances in locations that meet your requirements. For example, you might want to launch instances in Europe to be closer to your European customers or to meet legal requirements.
- An AWS GovCloud (US-West) account provides access to the AWS GovCloud (US-West) Region and the AWS GovCloud (US-East) Region. For more information, see [AWS GovCloud \(US\)](#).
- An Amazon AWS (China) account provides access to the Beijing and Ningxia Regions only. For more information, see [Amazon Web Services in China](#).

The following table lists the Regions provided by an AWS account. You can't describe or access additional Regions from an AWS account, such as the AWS GovCloud (US) Regions or the China Regions. To use a Region introduced after March 20, 2019, you must enable the Region. For more information, see [Specify which AWS Regions your account can use](#) in the *AWS Account Management Reference Guide*.

Code	Name	Opt-in status
us-east-2	US East (Ohio)	Not required
us-east-1	US East (Virginia)	Not required
us-west-1	US West (N. California)	Not required
us-west-2	US West (Oregon)	Not required
af-south-1	Africa (Cape Town)	Required
ap-east-1	Asia Pacific (Hong Kong)	Required
ap-south-2	Asia Pacific (Hyderabad)	Required
ap-southeast-3	Asia Pacific (Jakarta)	Required
ap-southeast-4	Asia Pacific (Melbourne)	Required
ap-south-1	Asia Pacific (Mumbai)	Not required
ap-northeast-3	Asia Pacific (Osaka)	Not required
ap-northeast-2	Asia Pacific (Seoul)	Not required
ap-southeast-1	Asia Pacific (Singapore)	Not required
ap-southeast-2	Asia Pacific (Sydney)	Not required
ap-northeast-1	Asia Pacific (Tokyo)	Not required
ca-central-1	Canada (Central)	Not required
ca-west-1	Canada West (Calgary)	Required
eu-central-1	Europe (Frankfurt)	Not required
eu-west-1	Europe (Ireland)	Not required
eu-west-2	Europe (London)	Not required

Code	Name	Opt-in status
eu-south-1	Europe (Milan)	Required
eu-west-3	Europe (Paris)	Not required
eu-south-2	Europe (Spain)	Required
eu-north-1	Europe (Stockholm)	Not required
eu-central-2	Europe (Zurich)	Required
il-central-1	Israel (Tel Aviv)	Required
me-south-1	Middle East (Bahrain)	Required
me-central-1	Middle East (UAE)	Required
sa-east-1	South America (São Paulo)	Not required

For more information, see [AWS Global Infrastructure](#).

The number and mapping of Availability Zones per Region may vary between AWS accounts To list the Availability Zones that are available to your account, you can use the Amazon EC2 console or the command line interface. For more information, see [Describe your Regions](#).

Regions and endpoints

When you work with an instance using the command line interface or API actions, you must specify its Regional endpoint. For more information about the Regions and endpoints for Amazon EC2, see [Amazon EC2 endpoints and quotas](#) in the *Amazon Web Services General Reference*.

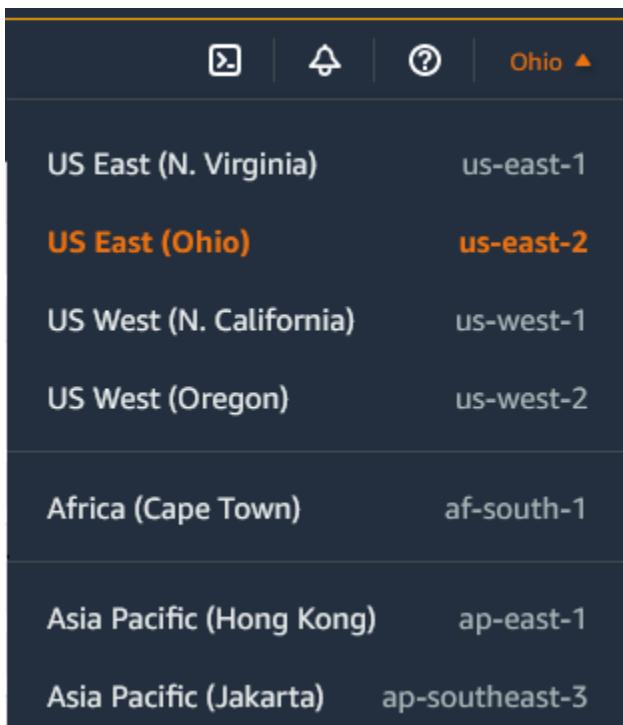

For more information about endpoints and protocols in AWS GovCloud (US-West), see [Service Endpoints](#) in the *AWS GovCloud (US) User Guide*.

Describe your Regions

You can use the Amazon EC2 console or the command line interface to determine which Regions are available for your account. For more information about these command line interfaces, see [Access Amazon EC2](#).

To find your Regions using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, choose the **Regions** selector.

3. Your EC2 resources for the selected Region are displayed on the **EC2 Dashboard** in the **Resources** section.

To find your Regions using the AWS CLI

Use the [describe-regions](#) command as follows to describe the Regions that are enabled for your account.

```
aws ec2 describe-regions
```

To describe all Regions, including any Regions that are disabled for your account, add the `--all-regions` option as follows.

```
aws ec2 describe-regions --all-regions
```

Get the Region display name

You can use AWS Systems Manager Parameter Store to view the display name of a Region. Each Region has public parameters in the following path.

```
/aws/service/global-infrastructure/regions/region-code
```

The public parameters for a Region include the following:

- /aws/service/global-infrastructure/regions/*region-code*/domain
- /aws/service/global-infrastructure/regions/*region-code*/geolocationCountry
- /aws/service/global-infrastructure/regions/*region-code*/geolocationRegion
- /aws/service/global-infrastructure/regions/*region-code*/longName
- /aws/service/global-infrastructure/regions/*region-code*/partition

The longName parameter contains the Region display name. The following [get-parameters-by-path](#) command returns the display name of the af-south-1 Region. It uses the --query option to scope the output to the name of the Region. You must enclose the query string in single quotes on Linux. To run this command using the Windows Command Prompt, either omit the single quotes or change them to double quotes.

Linux

```
aws ssm get-parameters-by-path \
--path /aws/service/global-infrastructure/regions/af-south-1 \
--query 'Parameters[?Name.contains(@, `longName`)].Value' \
--output text
```

Windows

```
aws ssm get-parameters-by-path ^
--path /aws/service/global-infrastructure/regions/af-south-1 ^
--query "Parameters[?Name.contains(@, `longName`)].Value" ^
--output text
```

Tools for PowerShell

If it is not installed, install the **AWS.Tools.SimpleSystemsManagement** module to Tools for PowerShell by running `Install-AWSToolsModule AWS.Tools.SimpleSystemsManagement -CleanUp`.

```
$parameterPath = "/aws/service/global-infrastructure/regions/af-south-1"  
$substringToMatch = "longName"  
$filteredParameters = Get-SSMParametersByPath -Path $parameterPath `| Where-Object { $_.Name -like "*$substringToMatch*" } | ForEach-Object { Write-Output $_.Value }  
$filteredParameters
```

The following is example output.

Africa (Cape Town)

For more information, see [Working with public parameters](#) in the *AWS Systems Manager User Guide*.

Specify the Region for a resource

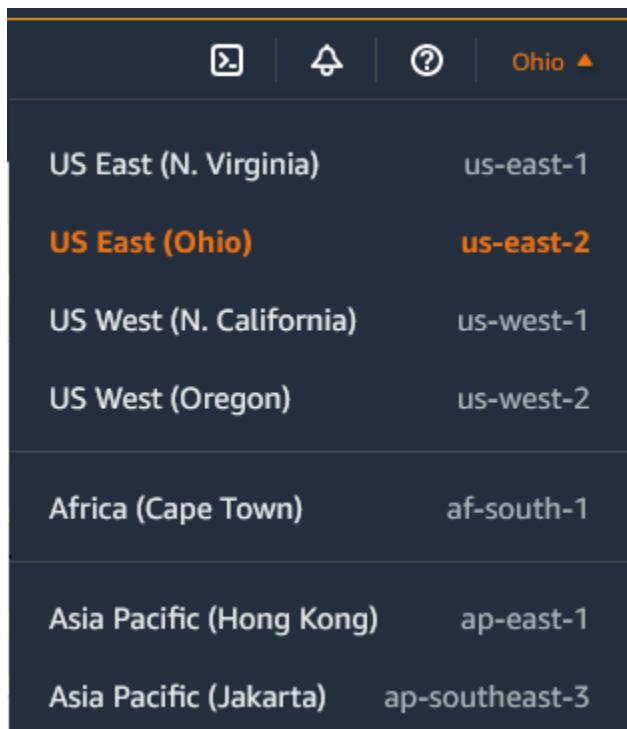

Every time you create an Amazon EC2 resource, you can specify the Region for the resource. You can specify the Region for a resource using the AWS Management Console or the command line.

Considerations

Some AWS resources might not be available in all Regions. Ensure that you can create the resources that you need in the desired Regions before you launch an instance.

To specify the Region for a resource using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, choose the **Regions** selector and then choose the Region.

To specify the default Region using the command line

You can set the value of an environment variable to the desired Regional endpoint (for example, <https://ec2.us-east-2.amazonaws.com>):

- `AWS_DEFAULT_REGION` (AWS CLI)
- `Set-AWSDefaultRegion` (AWS Tools for Windows PowerShell)

Alternatively, you can use the `--region` (AWS CLI) or `-Region` (AWS Tools for Windows PowerShell) command line option with each individual command. For example, `--region us-east-2`.

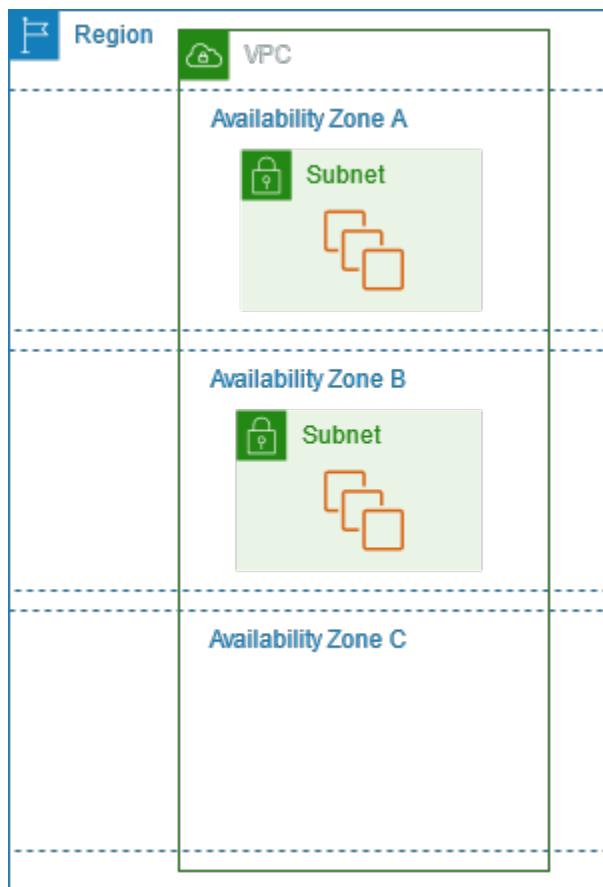

For more information about the endpoints for Amazon EC2, see [Amazon EC2 endpoints and quotas](#) in the *AWS General Reference*.

Availability Zones

Each Region has multiple, isolated locations known as *Availability Zones*. The code for Availability Zone is its Region code followed by a letter identifier. For example, `us-east-1a`.

When you launch an instance, you select a Region and a virtual private cloud (VPC), and then you can either select a subnet from one of the Availability Zones or let us choose one for you. If you distribute your instances across multiple Availability Zones and one instance fails, you can design your application so that an instance in another Availability Zone can handle requests. You can also use Elastic IP addresses to mask the failure of an instance in one Availability Zone by rapidly remapping the address to an instance in another Availability Zone.

The following diagram illustrates multiple Availability Zones in an AWS Region. Availability Zone A and Availability Zone B each have one subnet, and each subnet has instances. Availability Zone C has no subnets, therefore you can't launch instances into this Availability Zone.

As Availability Zones grow over time, our ability to expand them can become constrained. If this happens, we might restrict you from launching an instance in a constrained Availability Zone unless you already have an instance in that Availability Zone. Eventually, we might also remove the constrained Availability Zone from the list of Availability Zones for new accounts. Therefore, your account might have a different number of available Availability Zones in a Region than another account.

Contents

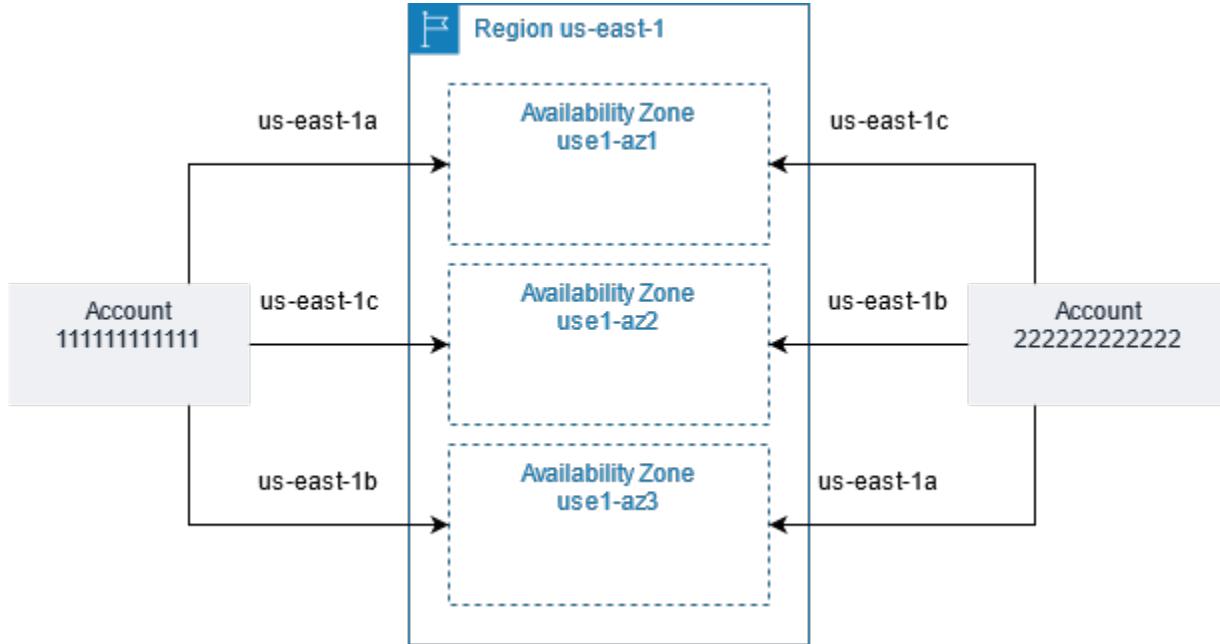

- [AZ IDs](#)
- [Describe your Availability Zones](#)
- [Launch instances in an Availability Zone](#)
- [Migrate an instance to another Availability Zone](#)

AZ IDs

To ensure that resources are distributed across the Availability Zones for a Region, we independently map Availability Zones to codes for each AWS account. For example, the Availability Zone `us-east-1a` for your AWS account might not be the same physical location as `us-east-1a` for another AWS account.

To coordinate Availability Zones across accounts, you must use the *AZ ID*, which is a unique and consistent identifier for an Availability Zone. For example, `use1-az1` is an AZ ID for the `us-east-1` Region and it has the same physical location in every AWS account. You can view the AZ IDs for your account to determine the physical location of your resources relative to the resources in another account. For example, if you share a subnet in the Availability Zone with the AZ ID `use1-az2` with another account, this subnet is available to that account in the Availability Zone whose AZ ID is also `use1-az2`.

The following diagram illustrates two accounts with different mappings of Availability Zone code to AZ ID.

Describe your Availability Zones

You can use the Amazon EC2 console or the command line interface to determine which Availability Zones are available for your account. For more information about these command line interfaces, see [Access Amazon EC2](#).

To find your Availability Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, choose the **Regions** selector and then choose the Region.
3. On the navigation pane, choose **EC2 Dashboard**.
4. The Availability Zones are listed in the **Service health** pane.

To find your Availability Zones using the AWS CLI

- Use the [describe-availability-zones](#) command as follows to describe the Availability Zones within the specified Region that are enabled for your account.

```
aws ec2 describe-availability-zones --region region-name
```

- Use the [describe-availability-zones](#) command as follows to describe the Availability Zones regardless of the opt-in status.

```
aws ec2 describe-availability-zones --all-availability-zones
```

Launch instances in an Availability Zone

When you launch an instance, select a Region that puts your instances closer to specific customers, or meets the legal or other requirements that you have. By launching your instances in separate Availability Zones, you can protect your applications from the failure of a single location.

When you launch an instance, you can optionally specify an Availability Zone in the Region that you are using. If you do not specify an Availability Zone, we select an Availability Zone for you. When you launch your initial instances, we recommend that you accept the default Availability Zone, because this allows us to select the best Availability Zone for you based on system health and available capacity. If you launch additional instances, specify an Availability Zone only if your new instances must be close to, or separated from, your running instances.

Migrate an instance to another Availability Zone

If necessary, you can migrate an instance from one Availability Zone to another. For example, if you try to modify the instance type of your instance and we can't launch an instance of the new instance type in the current Availability Zone, you can migrate the instance to an Availability Zone with capacity for the new instance type.

The migration process involves:

- Creating an AMI from the original instance
- Launching an instance in the new Availability Zone
- Updating the configuration of the new instance, as shown in the following procedure

To migrate an instance to another Availability Zone

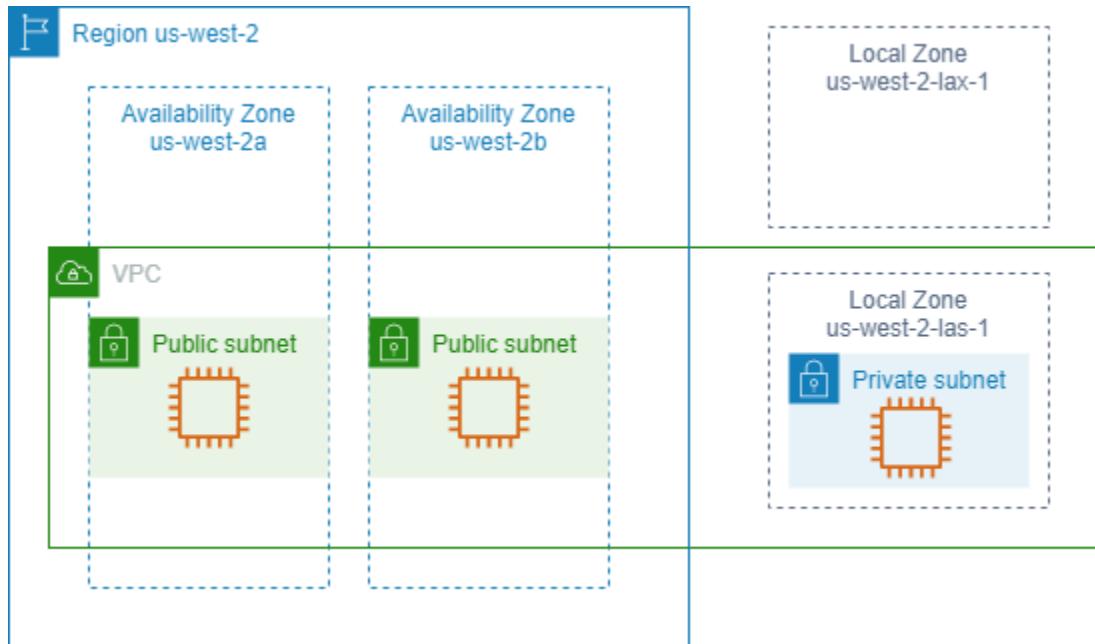

1. Create an AMI from the instance. The procedure depends on your operating system and the type of root device volume for the instance. For more information, see the documentation that corresponds to your operating system and root device volume:
 - [Create an Amazon EBS-backed Linux AMI](#)
 - [Create an instance store-backed Linux AMI](#)
 - [Create a custom Windows AMI](#)
2. If you need to preserve the private IPv4 address of the instance, you must delete the subnet in the current Availability Zone and then create a subnet in the new Availability Zone with the same IPv4 address range as the original subnet. Note that you must terminate all instances in a subnet before you can delete it. Therefore, you should create AMIs from all of the instances in your subnet so that you can move all instances from the current subnet to the new subnet.
3. Launch an instance from the AMI that you just created, specifying the new Availability Zone or subnet. You can use the same instance type as the original instance, or select a new instance type. For more information, see [Launch instances in an Availability Zone](#).
4. If the original instance has an associated Elastic IP address, associate it with the new instance. For more information, see [Disassociate an Elastic IP address](#).
5. If the original instance is a Reserved Instance, change the Availability Zone for your reservation. (If you also changed the instance type, you can also change the instance type for your reservation.) For more information, see [Submit modification requests](#).
6. (Optional) Terminate the original instance. For more information, see [Terminate an instance](#).

Local Zones

A Local Zone is an extension of an AWS Region in geographic proximity to your users. Local Zones have their own connections to the internet and support AWS Direct Connect, so that resources created in a Local Zone can serve local users with low-latency communications. For more information, see [AWS Local Zones](#).

The code for a Local Zone is its Region code followed by an identifier that indicates its physical location. For example, us-west-2-lax-1 in Los Angeles.

The following diagram illustrates the AWS Region us-west-2, two of its Availability Zones, and two of its Local Zones. The VPC spans the Availability Zones and one of the Local Zones. Each zone in the VPC has one subnet, and each subnet has an instance.

To use a Local Zone, you must first enable it. For more information, see [the section called “Opt in to Local Zones”](#). Next, create a subnet in the Local Zone. Finally, launch resources in the Local Zone subnet, such as instances, so that your applications are close to your users.

Contents

- [Available Local Zones](#)
- [Opt in to Local Zones](#)
- [Launch instances in a Local Zone](#)

Available Local Zones

You can use the Amazon EC2 console or a command line interface to determine which Local Zones are available for your account. For a complete list, see [AWS Local Zones Locations](#).

To find your Local Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, choose the **Regions** selector and then choose the parent Region.
3. On the navigation pane, choose **EC2 Dashboard**.
4. In the upper-right corner of the page, choose **Account attributes, Zones**.

To find your Local Zones using the AWS CLI

Use the [describe-availability-zones](#) command as follows to describe all Local Zones in the specified Region, even if they are not enabled. To describe only the Local Zones that you've enabled, omit the --all-availability-zones option.

```
aws ec2 describe-availability-zones --region region-name --filters Name=zone-type,Values=local-zone --all-availability-zones
```

Opt in to Local Zones

Before you can specify a Local Zone for a resource or service, you must opt in to Local Zones.

Consideration

Some AWS resources might not be available in all Regions. Make sure that you can create the resources that you need in the desired Regions or Local Zones before launching an instance in a specific Local Zone. For a list of services supported in each Local Zone see [AWS Local Zones Features](#).

To opt in to Local Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the upper-left corner of the page, select **New EC2 Experience**. You cannot complete this task using the old console experience.
3. From the navigation bar, choose the **Regions** selector and then choose the parent Region.
4. On the navigation pane, choose **EC2 Dashboard**.

5. In the upper-right corner of the page, choose **Account attributes, Zones**.
6. For the Local Zone to enable, choose **Manage**.
7. For **Zone group**, choose **Enabled**.
8. Choose **Update zone group**.

To opt in to Local Zones using the AWS CLI

Use the [modify-availability-zone-group](#) command.

Launch instances in a Local Zone

When you launch an instance, you can specify a subnet that is in a Local Zone. You also allocate an IP address from a network border group. A network border group is a unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses, for example, us-west-2-lax-1a.

You can allocate the following IP addresses from a network border group:

- Amazon-provided Elastic IPv4 addresses
- Amazon-provided IPv6 VPC addresses (available only in the Los Angeles zones)

For more information about how to launch an instance in a Local Zone, see [Getting started with AWS Local Zones](#) in the *AWS Local Zones User Guide*.

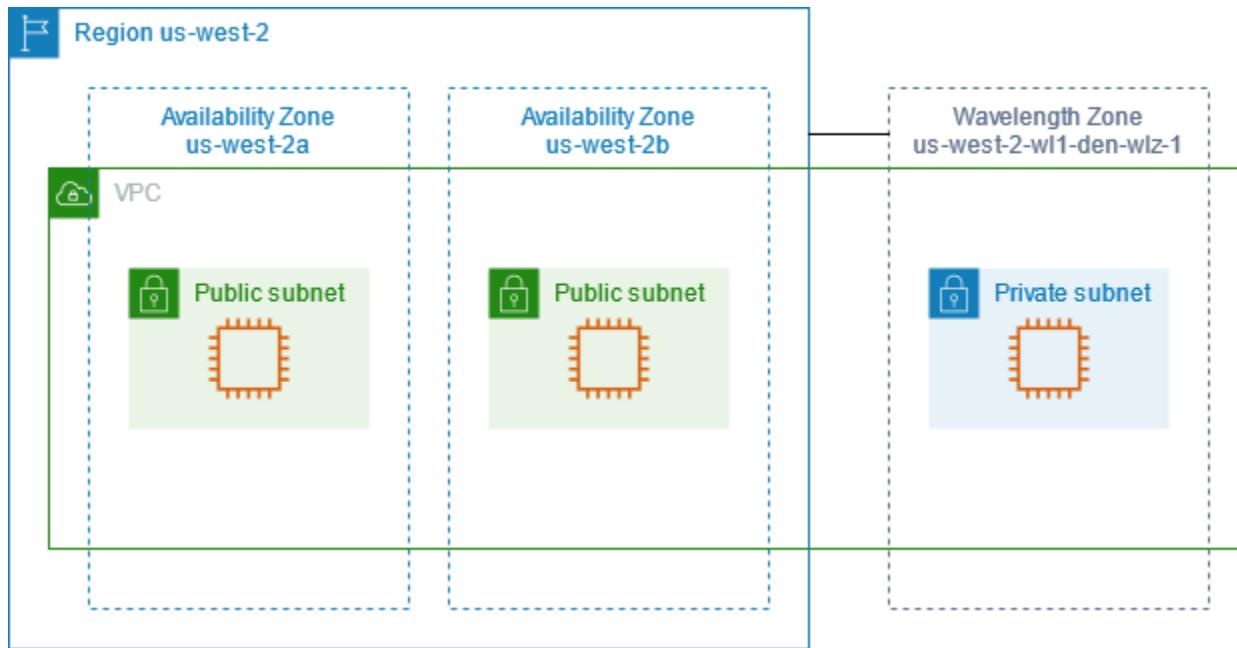

Wavelength Zones

AWS Wavelength enables developers to build applications that deliver ultra-low latencies to mobile devices and end users. Wavelength deploys standard AWS compute and storage services to the edge of telecommunication carriers' 5G networks. Developers can extend a virtual private cloud (VPC) to one or more Wavelength Zones, and then use AWS resources like Amazon EC2 instances to run applications that require ultra-low latency and a connection to AWS services in the Region.

A Wavelength Zone is an isolated zone in the carrier location where the Wavelength infrastructure is deployed. Wavelength Zones are tied to a Region. A Wavelength Zone is a logical extension of a Region, and is managed by the control plane in the Region.

The code for a Wavelength Zone is its Region code followed by an identifier that indicates the physical location. For example, us-east-1-wl1-bos-wlz-1 in Boston.

The following diagram illustrates the AWS Region us-west-2, two of its Availability Zones, and a Wavelength Zone. The VPC spans the Availability Zones and the Wavelength Zone. Each zone in the VPC has one subnet, and each subnet has an instance.

To use a Wavelength Zone, you must first opt in to the Zone. For more information, see [the section called “Enable Wavelength Zones”](#). Next, create a subnet in the Wavelength Zone. Finally, launch your resources in the Wavelength Zones subnet, so that your applications are closer to your end users.

Wavelength Zones are not available in every Region. For information about the Regions that support Wavelength Zones, see [Available Wavelength Zones](#) in the *AWS Wavelength Developer Guide*.

Contents

- [Describe your Wavelength Zones](#)
- [Enable Wavelength Zones](#)
- [Launch instances in a Wavelength Zone](#)

Describe your Wavelength Zones

You can use the Amazon EC2 console or the command line interface to determine which Wavelength Zones are available for your account. For more information about these command line interfaces, see [Access Amazon EC2](#).

To find your Wavelength Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, choose the **Regions** selector and then choose the Region.
3. On the navigation pane, choose **EC2 Dashboard**.
4. In the upper-right corner of the page, choose **Account attributes, Zones**.

To find your Wavelength Zones using the AWS CLI

- Use the [describe-availability-zones](#) command as follows to describe the Wavelength Zones within the specified Region that are enabled for your account.

```
aws ec2 describe-availability-zones --region region-name
```

- Use the [describe-availability-zones](#) command as follows to describe the Wavelength Zones regardless of the opt-in status.

```
aws ec2 describe-availability-zones --all-availability-zones
```

Enable Wavelength Zones

Before you specify a Wavelength Zone for a resource or service, you must opt in to Wavelength Zones.

Considerations

- Some AWS resources are not available in all Regions. Make sure that you can create the resources that you need in the desired Region or Wavelength Zone before launching an instance in a specific Wavelength Zone.

To opt in to Wavelength Zone using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the upper-left corner of the page, select **New EC2 Experience**. You cannot complete this task using the old console experience.
3. From the navigation bar, choose the **Regions** selector and then choose the Region.

4. On the navigation pane, choose **EC2 Dashboard**.
5. In the upper-right corner of the page, choose **Account attributes, Zones**.
6. Under **Wavelength Zones**, choose **Manage** for the Wavelength Zone.
7. Choose **Enable**.
8. Choose **Update zone group**.

To enable Wavelength Zones using the AWS CLI

Use the [modify-availability-zone-group](#) command.

Launch instances in a Wavelength Zone

When you launch an instance, you can specify a subnet which is in a Wavelength Zone. You also allocate a carrier IP address from a network border group, which is a unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses, for example, us-east-1-wl1-bos-wlz-1.

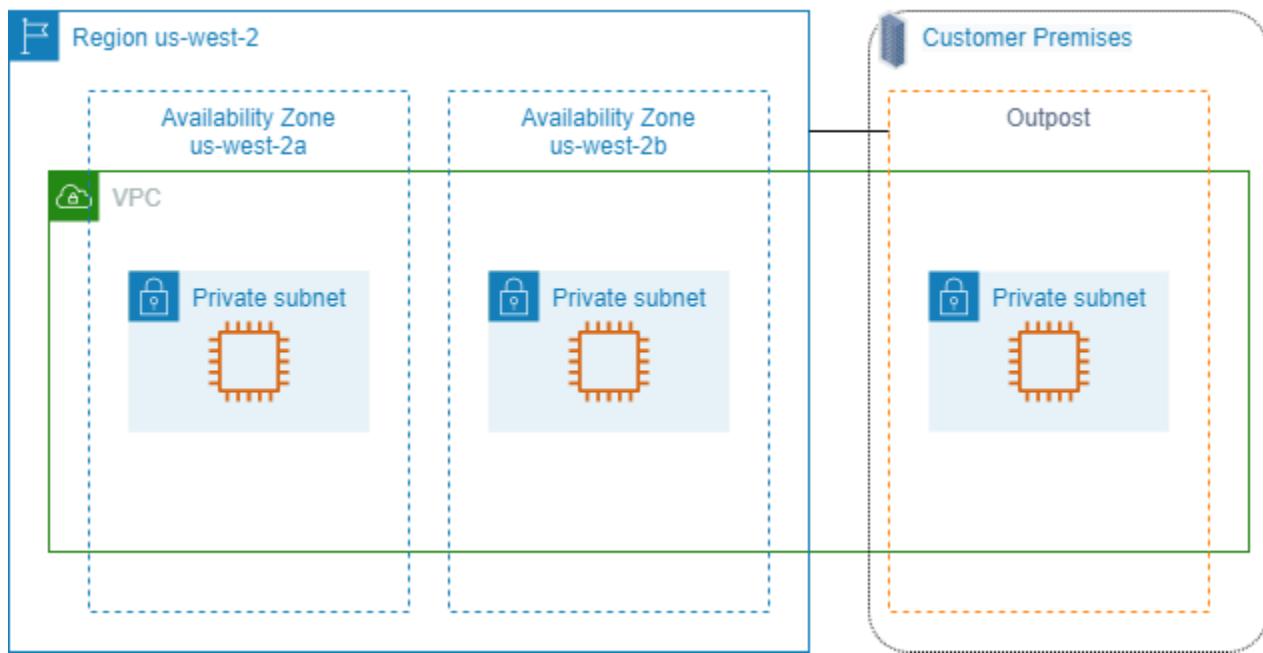

For information about how to launch an instance in a Wavelength Zone, see [Get started with AWS Wavelength](#) in the *AWS Wavelength Developer Guide*.

AWS Outposts

AWS Outposts is a fully managed service that extends AWS infrastructure, services, APIs, and tools to customer premises. By providing local access to AWS managed infrastructure, AWS Outposts enables customers to build and run applications on premises using the same programming interfaces as in AWS Regions, while using local compute and storage resources for lower latency and local data processing needs.

An Outpost is a pool of AWS compute and storage capacity deployed at a customer site. AWS operates, monitors, and manages this capacity as part of an AWS Region. You can create subnets on your Outpost and specify them when you create AWS resources. Instances in Outpost subnets communicate with other instances in the AWS Region using private IP addresses, all within the same VPC.

The following diagram illustrates the AWS Region us-west-2, two of its Availability Zones, and an Outpost. The VPC spans the Availability Zones and the Outpost. The Outpost is in an on-premises customer data center. Each zone in the VPC has one subnet, and each subnet has an instance.

To begin using AWS Outposts, you must create an Outpost and order Outpost capacity. For more information about Outposts configurations, see [our catalog](#). After your Outpost equipment is installed, the compute and storage capacity is available for you when you launch Amazon EC2 instances on your Outpost.

Launch instances on an Outpost

You can launch EC2 instances in the Outpost subnet that you created. Security groups control inbound and outbound traffic for instances with elastic network interfaces in an Outpost subnet, as they do for instances in an Availability Zone subnet. To connect to an EC2 instance in an Outpost subnet, you can specify a key pair when you launch the instance, as you do for instances in an Availability Zone subnet.

We recommend that you limit the root volume for an instance on an Outpost rack to 30 GiB or smaller. You can specify data volumes in the block device mapping of the AMI or the instance to provide additional storage. To trim unused blocks from the boot volume, see [How to Build Sparse EBS Volumes](#) in the AWS Partner Network Blog.

We recommend that you increase the NVMe timeout for the root volume. For more information, see [I/O operation timeout](#).

For information about how to create an Outpost, see [Get started with AWS Outposts](#) in the *AWS Outposts User Guide*.

Create a volume on an Outpost rack

AWS Outposts offers rack and server form factors. If your capacity is on an Outpost rack, you can create EBS volumes in the Outpost subnet that you created. When you create the volume, specify the Amazon Resource Name (ARN) of the Outpost.

The following [create-volume](#) command creates an empty 50 GB volume on the specified Outpost.

```
aws ec2 create-volume --availability-zone us-east-2a --outpost-arn arn:aws:outposts:us-east-2:123456789012:outpost/op-03e6fecad652a6138 --size 50
```

You can dynamically modify the size of your Amazon EBS gp2 volumes without detaching them. For more information about modifying a volume without detaching it, see [Request modifications to your EBS volumes](#).

Amazon EC2 instance IP addressing

Amazon EC2 and Amazon VPC support both the IPv4 and IPv6 addressing protocols. By default, Amazon VPC uses the IPv4 addressing protocol; you can't disable this behavior. When you create a VPC, you must specify an IPv4 CIDR block (a range of private IPv4 addresses). You can optionally assign an IPv6 CIDR block to your VPC and assign IPv6 addresses from that block to instances in your subnets.

Contents

- [Private IPv4 addresses](#)
- [Public IPv4 addresses](#)
- [Elastic IP addresses \(IPv4\)](#)
- [IPv6 addresses](#)
- [Work with the IPv4 addresses for your instances](#)
- [Work with the IPv6 addresses for your instances](#)
- [Multiple IP addresses](#)
- [EC2 instance hostnames](#)
- [Link-local addresses](#)

Private IPv4 addresses

A private IPv4 address is an IP address that's not reachable over the Internet. You can use private IPv4 addresses for communication between instances in the same VPC. For more information about the standards and specifications of private IPv4 addresses, see [RFC 1918](#). We allocate private IPv4 addresses to instances using DHCP.

 **Note**

You can create a VPC with a publicly routable CIDR block that falls outside of the private IPv4 address ranges specified in RFC 1918. However, for the purposes of this documentation, we refer to private IPv4 addresses (or 'private IP addresses') as the IP addresses that are within the IPv4 CIDR range of your VPC.

VPC subnets can be one of the following types:

- **IPv4-only subnets:** You can only create resources in these subnets with IPv4 addresses assigned to them.
- **IPv6-only subnets:** You can only create resources in these subnets with IPv6 addresses assigned to them.
- **IPv4 and IPv6 subnets:** You can create resources in these subnets with either IPv4 or IPv6 addresses assigned to them.

When you launch an EC2 instance into an IPv4-only or dual stack (IPv4 and IPv6) subnet, the instance receives a primary private IP address from the IPv4 address range of the subnet. For more information, see [IP addressing](#) in the *Amazon VPC User Guide*. If you don't specify a primary private IP address when you launch the instance, we select an available IP address in the subnet's IPv4 range for you. Each instance has a default network interface (`eth0`) that is assigned the primary private IPv4 address. You can also specify additional private IPv4 addresses, known as *secondary private IPv4 addresses*. Unlike primary private IP addresses, secondary private IP addresses can be reassigned from one instance to another. For more information, see [Multiple IP addresses](#).

A private IPv4 address, regardless of whether it is a primary or secondary address, remains associated with the network interface when the instance is stopped and started, or hibernated and started, and is released when the instance is terminated.

Public IPv4 addresses

A public IP address is an IPv4 address that's reachable from the Internet. You can use public addresses for communication between your instances and the Internet.

When you launch an instance in a default VPC, we assign it a public IP address by default. When you launch an instance into a nondefault VPC, the subnet has an attribute that determines whether instances launched into that subnet receive a public IP address from the public IPv4 address pool. By default, we don't assign a public IP address to instances launched in a nondefault subnet.

You can control whether your instance receives a public IP address as follows:

- Modifying the public IP addressing attribute of your subnet. For more information, see [Modify the public IPv4 addressing attribute for your subnet](#) in the *Amazon VPC User Guide*.
- Enabling or disabling the public IP addressing feature during launch, which overrides the subnet's public IP addressing attribute. For more information, see [Assign a public IPv4 address during instance launch](#).

A public IP address is assigned to your instance from Amazon's pool of public IPv4 addresses, and is not associated with your AWS account. When a public IP address is disassociated from your instance, it is released back into the public IPv4 address pool, and you cannot reuse it.

You cannot manually associate or disassociate a public IP (IPv4) address from your instance. Instead, in certain cases, we release the public IP address from your instance, or assign it a new one:

- We release your instance's public IP address when it is stopped, hibernated, or terminated. Your stopped or hibernated instance receives a new public IP address when it is started.
- We release your instance's public IP address when you associate an Elastic IP address with it. When you disassociate the Elastic IP address from your instance, it receives a new public IP address.
- If the public IP address of your instance in a VPC has been released, it will not receive a new one if there is more than one network interface attached to your instance.
- If your instance's public IP address is released while it has a secondary private IP address that is associated with an Elastic IP address, the instance does not receive a new public IP address.

If you require a persistent public IP address that can be associated to and from instances as you require, use an Elastic IP address instead.

If you use dynamic DNS to map an existing DNS name to a new instance's public IP address, it might take up to 24 hours for the IP address to propagate through the Internet. As a result, new instances might not receive traffic while terminated instances continue to receive requests. To solve this problem, use an Elastic IP address. You can allocate your own Elastic IP address, and associate it with your instance. For more information, see [Elastic IP addresses](#).

Note

- AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the [Public IPv4 Address tab on the Amazon VPC pricing page](#).
- Instances that access other instances through their public NAT IP address are charged for regional or Internet data transfer, depending on whether the instances are in the same Region.

Elastic IP addresses (IPv4)

An Elastic IP address is a public IPv4 address that you can allocate to your account. You can associate it to and disassociate it from instances as you require. It's allocated to your account until you choose to release it. For more information about Elastic IP addresses and how to use them, see [Elastic IP addresses](#).

We do not support Elastic IP addresses for IPv6.

IPv6 addresses

You can optionally associate an IPv6 CIDR block with your VPC and associate IPv6 CIDR blocks with your subnets. The IPv6 CIDR block for your VPC is automatically assigned from Amazon's pool of IPv6 addresses; you cannot choose the range yourself. For more information, see the following topics in the *Amazon VPC User Guide*:

- [IP addressing for your VPCs and subnets](#)
- [Add an IPv6 CIDR block to your VPC](#)
- [Add an IPv6 CIDR block to your subnet](#)

IPv6 addresses are globally unique and can be configured to remain private or reachable over the Internet. Your instance receives an IPv6 address if an IPv6 CIDR block is associated with your VPC and subnet, and if one of the following is true:

- Your subnet is configured to automatically assign an IPv6 address to an instance during launch. For more information, see [Modify the IPv6 addressing attribute for your subnet](#).
- You assign an IPv6 address to your instance during launch.
- You assign an IPv6 address to the primary network interface of your instance after launch.
- You assign an IPv6 address to a network interface in the same subnet, and attach the network interface to your instance after launch.

When your instance receives an IPv6 address during launch, the address is associated with the primary network interface (eth0) of the instance. You can manage the IPv6 addresses for your instances primary network interface (eth0) in the following ways:

- Assign and unassign IPv6 addresses from the network interface. The number of IPv6 addresses you can assign to a network interface and the number of network interfaces you can attach to an instance varies per instance type. For more information, see [IP addresses per network interface per instance type](#).
- Enable a primary IPv6 address. A primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. For more information, see [Create a network interface](#) or [Manage IP addresses](#).

An IPv6 address persists when you stop and start, or hibernate and start, your instance, and is released when you terminate your instance. You cannot reassign an IPv6 address while it's assigned to another network interface—you must first unassign it.

You can control whether instances are reachable via their IPv6 addresses by controlling the routing for your subnet or by using security group and network ACL rules. For more information, see [Internetwork traffic privacy](#) in the *Amazon VPC User Guide*.

For more information about reserved IPv6 address ranges, see [IANA IPv6 Special-Purpose Address Registry](#) and [RFC4291](#).

Work with the IPv4 addresses for your instances

You can assign a public IPv4 address to your instance when you launch it. You can view the IPv4 addresses for your instance in the console through either the **Instances** page or the **Network Interfaces** page.

Contents

- [View the IPv4 addresses](#)
- [Assign a public IPv4 address during instance launch](#)

View the IPv4 addresses

You can use the Amazon EC2 console to view the public and private IPv4 addresses of your instances. You can also determine the public IPv4 and private IPv4 addresses of your instance from within your instance by using instance metadata. For more information, see [Instance metadata and user data](#).

The public IPv4 address is displayed as a property of the network interface in the console, but it's mapped to the primary private IPv4 address through NAT. Therefore, if you inspect the properties of your network interface on your instance, for example, through `ifconfig` (Linux) or `ipconfig` (Windows), the public IPv4 address is not displayed. To determine your instance's public IPv4 address from an instance, use instance metadata.

To view the IPv4 addresses for an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select your instance.
3. The following information is available on the **Networking** tab:
 - **Public IPv4 address** — The public IPv4 address. If you associated an Elastic IP address with the instance or the primary network interface, this is the Elastic IP address.
 - **Private IPv4 addresses** — The private IPv4 address.
 - **Secondary private IPv4 addresses** — Any secondary private IPv4 addresses.
4. To view more detailed information, on the **Networking** tab, choose the ID of the primary network interface to open the **Network interfaces** page, and then choose the ID of the network interface to open its details page.

To view the IPv4 addresses for an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [describe-instances](#) (AWS CLI)
- [Get-EC2Instance](#) (AWS Tools for Windows PowerShell).

To determine your instance's IPv4 addresses using instance metadata

1. Connect to your instance. For more information, see [Connect to your Windows instance](#).
2. Use the following command to access the private IP address:

```
PS C:\> Invoke-RestMethod http://169.254.169.254/latest/meta-data/local-ipv4
```

3. Use the following command to access the public IP address:

```
PS C:\> Invoke-RestMethod http://169.254.169.254/latest/meta-data/public-ipv4
```

If an Elastic IP address is associated with the instance, the value returned is that of the Elastic IP address.

Assign a public IPv4 address during instance launch

Each subnet has an attribute that determines whether instances launched into that subnet are assigned a public IP address. By default, nondefault subnets have this attribute set to false, and default subnets have this attribute set to true. When you launch an instance, a public IPv4 addressing feature is also available for you to control whether your instance is assigned a public IPv4 address; you can override the default behavior of the subnet's IP addressing attribute. The public IPv4 address is assigned from Amazon's pool of public IPv4 addresses, and is assigned to the network interface with the device index of eth0. This feature depends on certain conditions at the time you launch your instance.

Considerations

- You can't manually disassociate the public IP address from your instance after launch. Instead, it's automatically released in certain cases, after which you cannot reuse it. For more information, see [Public IPv4 addresses](#). If you require a persistent public IP address that you can associate or

disassociate at will, assign an Elastic IP address to the instance after launch instead. For more information, see [Elastic IP addresses](#).

- You cannot auto-assign a public IP address if you specify more than one network interface. Additionally, you cannot override the subnet setting using the auto-assign public IP feature if you specify an existing network interface for eth0.
- The public IP addressing feature is only available during launch. However, whether you assign a public IP address to your instance during launch or not, you can associate an Elastic IP address with your instance after it's launched. For more information, see [Elastic IP addresses](#). You can also modify your subnet's public IPv4 addressing behavior. For more information, see [Modify the public IPv4 addressing attribute for your subnet](#).

To assign a public IPv4 address during instance launch using the console

Follow the procedure to [launch an instance](#), and when you configure [Network Settings](#), choose the option to **Auto-assign Public IP**.

To enable or disable the public IP addressing feature using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- Use the --associate-public-ip-address or the --no-associate-public-ip-address option with the [run-instances](#) command (AWS CLI)
- Use the -AssociatePublicIp parameter with the [New-EC2Instance](#) command (AWS Tools for Windows PowerShell)

Work with the IPv6 addresses for your instances

You can view the IPv6 addresses assigned to your instance, assign a public IPv6 address to your instance, or unassign an IPv6 address from your instance. You can view these addresses in the console through either the **Instances** page or the **Network Interfaces** page.

Contents

- [View the IPv6 addresses](#)
- [Assign an IPv6 address to an instance](#)
- [Unassign an IPv6 address from an instance](#)

View the IPv6 addresses

You can use the Amazon EC2 console, AWS CLI, and instance metadata to view the IPv6 addresses for your instances.

To view the IPv6 addresses for an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. On the **Networking** tab, locate **IPv6 addresses**.

To view the IPv6 addresses for an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [describe-instances](#) (AWS CLI)
- [Get-EC2Instance](#) (AWS Tools for Windows PowerShell).

To view the IPv6 addresses for an instance using instance metadata

1. Connect to your instance. For more information, see [Connect to your Windows instance](#).
2. Use the following command to view the IPv6 address (you can get the MAC address from <http://169.254.169.254/latest/meta-data/network/interfaces/macs/>).

```
PS C:\> Invoke-RestMethod http://169.254.169.254/latest/meta-data/network/
interfaces/macs/mac-address/ipv6s
```

Assign an IPv6 address to an instance

If your VPC and subnet have IPv6 CIDR blocks associated with them, you can assign an IPv6 address to your instance during or after launch. The IPv6 address is assigned from the IPv6 address range of the subnet, and is assigned to the network interface with the device index of eth0.

To assign an IPv6 address during instance launch

Follow the procedure to [launch an instance](#), and when you configure [Network Settings](#), choose the option to **Auto-assign IPv6 IP**.

To assign an IPv6 address after launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and choose **Actions, Networking, Manage IP addresses**.
4. Expand the network interface. Under **IPv6 addresses**, choose **Assign new IP address**. Enter an IPv6 address from the range of the subnet or leave the field blank to let Amazon choose an IPv6 address for you.
5. Choose **Save**.

To assign an IPv6 address using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- Use the `--ipv6-addresses` option with the [run-instances](#) command (AWS CLI)
- Use the `Ipv6Addresses` property for `-NetworkInterface` in the [New-EC2Instance](#) command (AWS Tools for Windows PowerShell)
- [assign-ipv6-addresses](#) (AWS CLI)
- [Register-EC2Ipv6AddressList](#) (AWS Tools for Windows PowerShell)

Unassign an IPv6 address from an instance

You can unassign an IPv6 address from an instance at any time.

To unassign an IPv6 address from an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and choose **Actions, Networking, Manage IP addresses**.
4. Expand the network interface. Under **IPv6 addresses**, choose **Unassign** next to the IPv6 address.
5. Choose **Save**.

To unassign an IPv6 address from an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [unassign-ipv6-addresses](#) (AWS CLI)
- [Unregister-EC2Ipv6AddressList](#) (AWS Tools for Windows PowerShell).

Multiple IP addresses

You can specify multiple private IPv4 and IPv6 addresses for your instances. The number of network interfaces and private IPv4 and IPv6 addresses that you can specify for an instance depends on the instance type. For more information, see [IP addresses per network interface per instance type](#).

It can be useful to assign multiple IP addresses to an instance in your VPC to do the following:

- Host multiple websites on a single server by using multiple SSL certificates on a single server and associating each certificate with a specific IP address.
- Operate network appliances, such as firewalls or load balancers, that have multiple IP addresses for each network interface.
- Redirect internal traffic to a standby instance in case your instance fails, by reassigning the secondary IP address to the standby instance.

Contents

- [How multiple IP addresses work](#)
- [Work with multiple IPv4 addresses](#)
- [Work with multiple IPv6 addresses](#)

How multiple IP addresses work

The following list explains how multiple IP addresses work with network interfaces:

- You can assign a secondary private IPv4 address to any network interface.
- You can assign multiple IPv6 addresses to a network interface that's in a subnet that has an associated IPv6 CIDR block.

- You must choose a secondary IPv4 address from the IPv4 CIDR block range of the subnet for the network interface.
- You must choose IPv6 addresses from the IPv6 CIDR block range of the subnet for the network interface.
- You associate security groups with network interfaces, not individual IP addresses. Therefore, each IP address you specify in a network interface is subject to the security group of its network interface.
- Multiple IP addresses can be assigned and unassigned to network interfaces attached to running or stopped instances.
- Secondary private IPv4 addresses that are assigned to a network interface can be reassigned to another one if you explicitly allow it.
- An IPv6 address cannot be reassigned to another network interface; you must first unassign the IPv6 address from the existing network interface.
- When assigning multiple IP addresses to a network interface using the command line tools or API, the entire operation fails if one of the IP addresses can't be assigned.
- Primary private IPv4 addresses, secondary private IPv4 addresses, Elastic IP addresses, and IPv6 addresses remain with a secondary network interface when it is detached from an instance or attached to an instance.
- Although you can't detach the primary network interface from an instance, you can reassign the secondary private IPv4 address of the primary network interface to another network interface.

The following list explains how multiple IP addresses work with Elastic IP addresses (IPv4 only):

- Each private IPv4 address can be associated with a single Elastic IP address, and vice versa.
- When a secondary private IPv4 address is reassigned to another interface, the secondary private IPv4 address retains its association with an Elastic IP address.
- When a secondary private IPv4 address is unassigned from an interface, an associated Elastic IP address is automatically disassociated from the secondary private IPv4 address.

Work with multiple IPv4 addresses

You can assign a secondary private IPv4 address to an instance, associate an Elastic IPv4 address with a secondary private IPv4 address, and unassign a secondary private IPv4 address.

Tasks

- [Assign a secondary private IPv4 address](#)
- [Configure the operating system on your instance to recognize secondary private IPv4 addresses](#)
- [Associate an Elastic IP address with the secondary private IPv4 address](#)
- [View your secondary private IPv4 addresses](#)
- [Unassign a secondary private IPv4 address](#)

Assign a secondary private IPv4 address

You can assign the secondary private IPv4 address to the network interface for an instance as you launch the instance, or after the instance is running. This section includes the following procedures.

- [To assign a secondary private IPv4 address when launching an instance](#)
- [To assign a secondary IPv4 address during launch using the command line](#)
- [To assign a secondary private IPv4 address to a network interface](#)
- [To assign a secondary private IPv4 address to an existing instance using the command line](#)

New console

To assign a secondary private IPv4 address when launching an instance

1. Follow the procedure to [launch an instance](#). For [Network settings](#), choose **Edit**.
2. Select a VPC and a subnet.
3. Expand **Advanced network configuration**.
4. For **Secondary IP**, choose **Automatically assign** and enter the number of IP addresses (Amazon automatically assigns secondary IPv4 addresses) or choose **Manually assign** and enter the IPv4 addresses.
5. Complete the remaining steps to [launch the instance](#).

Old console

To assign a secondary private IPv4 address when launching an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. Select an AMI, then choose an instance type and choose **Next: Configure Instance Details**.

4. On the **Configure Instance Details** page, for **Network**, select a VPC and for **Subnet**, select a subnet.
5. In the **Network Interfaces** section, do the following, and then choose **Next: Add Storage**:
 - To add another network interface, choose **Add Device**. The console enables you to specify up to two network interfaces when you launch an instance. After you launch the instance, choose **Network Interfaces** in the navigation pane to add additional network interfaces. The total number of network interfaces that you can attach varies by instance type. For more information, see [IP addresses per network interface per instance type](#).

 **Important**

When you add a second network interface, the system can no longer auto-assign a public IPv4 address. You will not be able to connect to the instance over IPv4 unless you assign an Elastic IP address to the primary network interface (eth0). You can assign the Elastic IP address after you complete the Launch wizard. For more information, see [Work with Elastic IP addresses](#).

- For each network interface, under **Secondary IP addresses**, choose **Add IP**, and then enter a private IP address from the subnet range, or accept the default Auto-assign value to let Amazon select an address.
6. On the next **Add Storage** page, you can specify volumes to attach to the instance besides the volumes specified by the AMI (such as the root device volume), and then choose **Next: Add Tags**.
 7. On the **Add Tags** page, specify tags for the instance, such as a user-friendly name, and then choose **Next: Configure Security Group**.
 8. On the **Configure Security Group** page, select an existing security group or create a new one. Choose **Review and Launch**.
 9. On the **Review Instance Launch** page, review your settings, and then choose **Launch** to choose a key pair and launch your instance. If you're new to Amazon EC2 and haven't created any key pairs, the wizard prompts you to create one.

 **Important**

After you have added a secondary private IP address to a network interface, you must connect to the instance and configure the secondary private IP address on the instance

itself. For more information, see [Configure the operating system on your instance to recognize secondary private IPv4 addresses](#).

To assign a secondary IPv4 address during launch using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).
 - The `--secondary-private-ip-addresses` option with the [run-instances](#) command (AWS CLI)
 - Define `-NetworkInterface` and specify the `PrivateIpAddresses` parameter with the [New-EC2Instance](#) command (AWS Tools for Windows PowerShell).

To assign a secondary private IPv4 address to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**, and then select the network interface for the instance.
3. Choose **Actions, Manage IP Addresses**.
4. Expand the network interface. Under **IPv4 addresses**, choose **Assign new IP address**.
5. Enter a specific IPv4 address that's within the subnet range for the instance, or leave the field blank to let Amazon select an IPv4 address for you.
6. (Optional) Select **Allow** to allow the secondary private IP address to be reassigned if it is already assigned to another network interface.
7. Choose **Save**.

Alternatively, you can assign a secondary private IPv4 address to an instance. Choose **Instances** in the navigation pane, select the instance, and then choose **Actions, Networking, Manage IP addresses**. You can configure the same information as you did in the steps above. The IP address is assigned to the primary network interface (`eth0`) for the instance.

To assign a secondary private IPv4 address to an existing instance using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [assign-private-ip-addresses](#) (AWS CLI)
- [Register-EC2PrivateIpAddress](#) (AWS Tools for Windows PowerShell)

Configure the operating system on your instance to recognize secondary private IPv4 addresses

After you assign a secondary private IPv4 address to your instance, you need to configure the operating system on your instance to recognize the secondary private IP address.

For information about configuring a Windows instance, see [Configure a secondary private IPv4 address for your Windows instance](#).

Associate an Elastic IP address with the secondary private IPv4 address

To associate an Elastic IP address with a secondary private IPv4 address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the check box for the Elastic IP address
4. Choose **Actions, Associate Elastic IP address**.
5. For **Resource type**, choose **Network interface**. select the network interface, and then select the secondary IP address from the **Private IP address** list.
6. For **Network interface**, select the network interface. select the secondary IP address from the **Private IP address** list.
7. For **Private IP address**, select the secondary IP address.
8. Choose **Associate**.

To associate an Elastic IP address with a secondary private IPv4 address using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).
 - [associate-address](#) (AWS CLI)
 - [Register-EC2Address](#) (AWS Tools for Windows PowerShell)

View your secondary private IPv4 addresses

To view the private IPv4 addresses assigned to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the check box for the network interface.
4. On the **Details** tab, under **IP addresses**, locate **Private IPv4 address** and **Secondary private IPv4 addresses**.

To view the private IPv4 addresses assigned to an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the check box for the instance.
4. On the **Networking** tab, under **Networking details**, locate **Private IPv4 addresses** and **Secondary private IPv4 addresses**.

Unassign a secondary private IPv4 address

If you no longer require a secondary private IPv4 address, you can unassign it from the instance or the network interface. When a secondary private IPv4 address is unassigned from a network interface, the Elastic IP address (if it exists) is also disassociated.

To unassign a secondary private IPv4 address from an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select an instance, choose **Actions**, **Networking**, **Manage IP addresses**.
4. Expand the network interface. For **IPv4 addresses**, choose **Unassign** for the IPv4 address to unassign.
5. Choose **Save**.

To unassign a secondary private IPv4 address from a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface, choose **Actions, Manage IP addresses**.
4. Expand the network interface. For **IPv4 addresses**, choose **Unassign** for the IPv4 address to unassign.
5. Choose **Save**.

To unassign a secondary private IPv4 address using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).
 - [unassign-private-ip-addresses](#) (AWS CLI)
 - [Unregister-EC2PrivateIpAddress](#) (AWS Tools for Windows PowerShell)

Work with multiple IPv6 addresses

You can assign multiple IPv6 addresses to your instance, view the IPv6 addresses assigned to your instance, and unassign IPv6 addresses from your instance.

Contents

- [Assign multiple IPv6 addresses](#)
- [View your IPv6 addresses](#)
- [Unassign an IPv6 address](#)

Assign multiple IPv6 addresses

You can assign one or more IPv6 addresses to your instance during launch or after launch. To assign an IPv6 address to an instance, the VPC and subnet in which you launch the instance must have an associated IPv6 CIDR block.

New console

To assign multiple IPv6 addresses during launch

1. Follow the procedure to [launch an instance](#). For [Network settings](#), choose **Edit**.
2. Select a VPC and a subnet.

3. Expand **Advanced network configuration**.
4. For **IPv6 IPs**, choose **Automatically assign** and the number of IP addresses (Amazon automatically assigns the IPv6 addresses) or choose **Manually assign** and enter the IPv6 addresses.
5. Complete the remaining steps to [launch the instance](#).

Old console

To assign multiple IPv6 addresses during launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the dashboard, choose **Launch Instance**.
3. Select an AMI, choose an instance type, and choose **Next: Configure Instance Details**. Ensure that you choose an instance type that supports IPv6. For more information, see [Amazon EC2 instance types](#).
4. On the **Configure Instance Details** page, select a VPC from the **Network** list, and a subnet from the **Subnet** list.
5. In the **Network Interfaces** section, do the following, and then choose **Next: Add Storage**:
 - To assign a single IPv6 address to the primary network interface (eth0), under **IPv6 IPs**, choose **Add IP**. To add a secondary IPv6 address, choose **Add IP** again. You can enter an IPv6 address from the range of the subnet, or leave the default **Auto-assign** value to let Amazon choose an IPv6 address from the subnet for you.
 - Choose **Add Device** to add another network interface and repeat the steps above to add one or more IPv6 addresses to the network interface. The console enables you to specify up to two network interfaces when you launch an instance. After you launch the instance, choose **Network Interfaces** in the navigation pane to add additional network interfaces. The total number of network interfaces that you can attach varies by instance type. For more information, see [IP addresses per network interface per instance type](#).
6. Follow the next steps in the wizard to attach volumes and tag your instance.
7. On the **Configure Security Group** page, select an existing security group or create a new one. If you want your instance to be reachable over IPv6, ensure that your security group has rules that allow access from IPv6 addresses. For more information, see [Security group rules for different use cases](#). Choose **Review and Launch**.

8. On the **Review Instance Launch** page, review your settings, and then choose **Launch** to choose a key pair and launch your instance. If you're new to Amazon EC2 and haven't created any key pairs, the wizard prompts you to create one.

You can use the **Instances** screen Amazon EC2 console to assign multiple IPv6 addresses to an existing instance. This assigns the IPv6 addresses to the primary network interface (eth0) for the instance. To assign a specific IPv6 address to the instance, ensure that the IPv6 address is not already assigned to another instance or network interface.

To assign multiple IPv6 addresses to an existing instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, choose **Actions, Networking, Manage IP addresses**.
4. Expand the network interface. For **IPv6 addresses**, choose **Assign new IP address** for each IPv6 address to add. You can specify an IPv6 address from the range of the subnet, or leave the field empty to let Amazon choose an IPv6 address for you.
5. Choose **Save**.

Alternatively, you can assign multiple IPv6 addresses to an existing network interface. The network interface must have been created in a subnet that has an associated IPv6 CIDR block. To assign a specific IPv6 address to the network interface, ensure that the IPv6 address is not already assigned to another network interface.

To assign multiple IPv6 addresses to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select your network interface, choose **Actions, Manage IP addresses**.
4. Expand the network interface. For **IPv6 addresses**, choose **Assign new IP address** for each IPv6 address to add. You can specify an IPv6 address from the range of the subnet, or leave the field empty to let Amazon choose an IPv6 address for you.
5. Choose **Save**.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- **Assign an IPv6 address during launch:**

- Use the `--ipv6-addresses` or `--ipv6-address-count` options with the [run-instances](#) command (AWS CLI)
- Define `-NetworkInterface` and specify the `Ipv6Addresses` or `Ipv6AddressCount` parameters with the [New-EC2Instance](#) command (AWS Tools for Windows PowerShell).

- **Assign an IPv6 address to a network interface:**

- [assign-ipv6-addresses](#) (AWS CLI)
- [Register-EC2Ipv6AddressList](#) (AWS Tools for Windows PowerShell)

View your IPv6 addresses

You can view the IPv6 addresses for an instance or for a network interface.

To view the IPv6 addresses assigned to an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the check box for your instance.
4. On the **Networking** tab, locate the **IPv6 addresses** field.

To view the IPv6 addresses assigned to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the check box for your network interface.
4. On the **Details** tab, under **IP addresses**, locate the **IPv6 addresses** field.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- **View the IPv6 addresses for an instance:**

- [describe-instances](#) (AWS CLI)
- [Get-EC2Instance](#) (AWS Tools for Windows PowerShell).

- **View the IPv6 addresses for a network interface:**

- [describe-network-interfaces](#) (AWS CLI)
- [Get-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

Unassign an IPv6 address

You can unassign an IPv6 address from the primary network interface of an instance, or you can unassign an IPv6 address from a network interface.

To unassign an IPv6 address from an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the check box for your instance, and then choose **Actions, Networking, Manage IP addresses**.
4. Expand the network interface. Under **IPv6 addresses**, choose **Unassign** next to the IPv6 address.
5. Choose **Save**.

To unassign an IPv6 address from a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the check box for your network interface, and then choose **Actions, Manage IP addresses**.
4. Expand the network interface. Under **IPv6 addresses**, choose **Unassign** next to the IPv6 address.
5. Choose **Save**.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [unassign-ipv6-addresses](#) (AWS CLI)
- [Unregister-EC2Ipv6AddressList](#) (AWS Tools for Windows PowerShell).

EC2 instance hostnames

When you create an EC2 instance, AWS creates a hostname for that instance. For more information on the types of hostnames and how they're provisioned by AWS, see [Amazon EC2 instance hostname types](#). Amazon provides a DNS server that resolves Amazon-provided hostnames to IPv4 and IPv6 addresses. The Amazon DNS server is located at the base of your VPC network range plus two. For more information, see [DNS attributes for your VPC](#) in the *Amazon VPC User Guide*.

Link-local addresses

Link-local addresses are well-known, non-routable IP addresses. Amazon EC2 uses addresses from the link-local address space to provide services that are accessible only from an EC2 instance. These services do not run on the instance, they run on the underlying host. When you access the link-local addresses for these services, you're communicating with either the Xen hypervisor or the Nitro controller.

Link-local address ranges

- IPv4 – 169.254.0.0/16 (169.254.0.0 to 169.254.255.255)
- IPv6 – fe80::/10

Services that you access using link-local addresses

- [Instance Metadata Service](#)
- [Amazon Route 53 Resolver](#) (also known as the Amazon DNS server)
- [Amazon Time Sync Service](#)

Amazon EC2 instance hostname types

This section describes the Amazon EC2 instance guest OS hostname types available when you launch instances into your VPC subnets.

The hostname distinguishes the EC2 instances on your network. You may use the hostname of an instance if, for example, you want to run scripts to communicate with some or all of the instances on your network.

Contents

- [Types of EC2 hostnames](#)
- [Where you see Resource name and IP name](#)
- [How to decide whether to choose Resource name or IP name](#)
- [Modify Hostname type and DNS Hostname configurations](#)

Types of EC2 hostnames

There are two hostname types for the guest OS hostname when EC2 instances are launched in a VPC:

- **IP name:** The legacy naming scheme where, when you launch an instance, the *private IPv4 address* of the instance is included in the hostname of the instance. The IP name exists for the life of the EC2 instance. When used as the Private DNS hostname, it will only return the private IPv4 address (A record).
- **Resource name:** When you launch an instance, the *EC2 instance ID* is included in the hostname of the instance. The resource name exists for the life of the EC2 instance. When used as the Private DNS hostname, it can return both the private IPv4 address (A record) and/or the IPv6 Global Unicast Address (AAAA record).

The EC2 instance guest OS hostname type depends on the subnet settings:

- If the instance is launched into an IPv4-only subnet, you can select either IP name or resource name.
- If the instance is launched into a dual-stack (IPv4+IPv6) subnet, you can select either IP name or resource name.
- If the instance is launched into an IPv6-only subnet, resource name is used automatically.

Contents

- [IP name](#)
- [Resource name](#)
- [The difference between IP name and Resource name](#)

IP name

When you launch an EC2 instance with the **Hostname type** of **IP name**, the guest OS hostname is configured to use the private IPv4 address.

- Format for an instance in us-east-1: *private-ipv4-address.ec2.internal*
- Example: *ip-10-24-34-0.ec2.internal*
- Format for an instance in any other AWS Region: *private-ipv4-address.region.compute.internal*
- Example: *ip-10-24-34-0.us-west-2.compute.internal*

Resource name

When you launch EC2 instances in IPv6-only subnets, the **Hostname type** of **Resource name** is selected by default. When you launch an instance in IPv4-only or dual-stack (IPv4+IPv6) subnets, **Resource name** is an option that you can select. After you launch an instance, you can manage the hostname configuration. For more information, see [Modify Hostname type and DNS Hostname configurations](#).

When you launch an EC2 instance with a **Hostname type** of **Resource name**, the guest OS hostname is configured to use the EC2 instance ID.

- Format for an instance in us-east-1: *ec2-instance-id.ec2.internal*
- Example: *i-0123456789abcdef.ec2.internal*
- Format for an instance in any other AWS Region: *ec2-instance-id.region.compute.internal*
- Example: *i-0123456789abcdef.us-west-2.compute.internal*

The difference between IP name and Resource name

DNS queries for both IP names and resource names coexist to ensure backward compatibility and to allow you to migrate from IP based-naming for hostnames to resource-based naming. For private DNS hostnames based on IP names, you cannot configure whether a DNS A record query for the instance is responded to or not. DNS A record queries are always responded to irrespective of the guest OS hostname settings. In contrast, for private DNS hostnames based on resource name, you can configure whether DNS A and/or DNS AAAA queries for the instance are responded to or not. You configure the response behavior when you launch an instance or modify a subnet. For more information, see [Modify Hostname type and DNS Hostname configurations](#).

Where you see Resource name and IP name

This section describes where you see the hostname types resource name and IP name in the EC2 console.

Contents

- [When creating an EC2 instance](#)
- [When viewing the details of an existing EC2 instance](#)

When creating an EC2 instance

When you create an EC2 instance, depending on which type of subnet you select, **Hostname type of Resource name** might be available or it might be selected and not be modifiable. This section explains the scenarios in which you see the hostname types resource name and IP name.

Scenario 1

You create an EC2 instance in the wizard (see [Launch an instance using the new launch instance wizard](#)) and, when you configure the details, you choose a subnet that you configured to be IPv6-only.

In this case, the **Hostname type of Resource name** is selected automatically and is not modifiable. **DNS Hostname** options of **Enable IP name IPv4 (A record) DNS requests** and **Enable resource-based IPv4 (A record) DNS requests** are deselected automatically and are not modifiable. **Enable resource-based IPv6 (AAAA record) DNS requests** is selected by default but is modifiable. If selected, DNS requests to the resource name will resolve to the IPv6 address (AAAA record) of this EC2 instance.

Scenario 2

You create an EC2 instance in the wizard (see [Launch an instance using the new launch instance wizard](#)) and, when you configure the details, you choose a subnet configured with an IPv4 CIDR block or both an IPv4 and IPv6 CIDR block ("dual stack").

In this case, **Enable IP name IPv4 (A record) DNS requests** is selected automatically and can't be changed. This means that requests to the IP name will resolve to the IPv4 address (A record) of this EC2 instance.

The options default to the configurations of the subnet, but you can modify the options for this instance depending on the subnet settings:

- **Hostname type:** Determines whether you want the guest OS hostname of the EC2 instance to be the resource name or IP name. The default value is **IP name**.
- **Enable resource-based IPv4 (A record) DNS requests:** Determines whether requests to your resource name resolve to the private IPv4 address (A record) of this EC2 instance. This option is not selected by default.
- **Enable resource-based IPv6 (AAAA record) DNS requests:** Determines whether requests to your resource name resolve to the IPv6 GUA address (AAAA record) of this EC2 instance. This option is not selected by default.

When viewing the details of an existing EC2 instance

You can see the hostname values for an existing EC2 instance in the **Details** tab for the EC2 instance:

- **Hostname type:** The hostname in IP name or resource name format.
- **Private IP DNS name (IPv4 only):** The IP name that will always resolve to the private IPv4 address of the instance.
- **Private resource DNS name:** The resource name that resolves to the DNS records selected for this instance.
- **Answer private resource DNS name:** The resource name resolves to IPv4 (A), IPv6 (AAAA) or IPv4 and IPv6 (A and AAAA) DNS records.

In addition, if you connect to your EC2 instance directly over SSH and enter the hostname command, you'll see the hostname in either the IP name or resource name format.

How to decide whether to choose Resource name or IP name

When you launch an EC2 instance (see [Launch an instance using the new launch instance wizard](#)), if you choose a **Hostname type of Resource name**, the EC2 instance launches with a hostname in the resource name format. In such cases, the DNS record for this EC2 instance can also point to the resource name. This gives you the flexibility to choose whether that hostname resolves to the IPv4 address, the IPv6 address, or both the IPv4 and IPv6 address of the instance. If you plan to use IPv6 in the future or if you are using dual-stack subnets today, it's best to use a **Hostname type of Resource name** so that you change DNS resolution for the hostnames of your instances without making any changes to the DNS records themselves. The resource name allows you to add and remove IPv4 and IPv6 DNS resolution on an EC2 instance.

If instead you choose a **Hostname type of IP name**, and use it as the DNS hostname, it can only resolve to the IPv4 address of the instance. It will not resolve to the IPv6 address of the instance even if the instance has both an IPv4 address and an IPv6 address associated with it.

Modify Hostname type and DNS Hostname configurations

Follow the steps in this section to modify Hostname type and DNS Hostname configurations for subnets or EC2 instances after they've been launched.

Contents

- [Subnets](#)
- [EC2 instances](#)

Subnets

Modify the configurations for a subnet by selecting a subnet in the VPC console and choosing **Actions, Edit subnet settings**.

Note

Changing the subnet settings doesn't change the configuration of EC2 instances that are already launched in the subnet.

- **Hostname type:** Determines whether you want the default setting of the guest OS hostname of the EC2 instance launched in the subnet to be the resource name or IP name.

- **Enable DNS hostname IPv4 (A record) requests:** Determines whether DNS requests/queries to your resource name resolve to the private IPv4 address (A record) of this EC2 instance.
- **Enable DNS hostname IPv6 (AAAA record) requests:** Determines whether DNS requests/queries to your resource name resolve to the IPv6 address (AAAA record) of this EC2 instance.

EC2 instances

Follow the steps in this section to modify the Hostname type and DNS Hostname configurations for an EC2 instance.

Important

- To change the **Use resource based naming as guest OS hostname** setting, you must first stop the instance. To change the **Answer DNS hostname IPv4 (A record) request** or **Answer DNS hostname IPv6 (AAAA record) requests** settings, you don't have to stop the instance.
- To modify any of the settings for non-EBS backed EC2 instance types, you cannot stop the instance. You must terminate the instance and launch a new instance with the desired Hostname type and DNS Hostname configurations.

To modify the Hostname type and DNS Hostname configurations for an EC2 instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. If you're going to change the **Use resource based naming as guest OS hostname** setting, first stop the EC2 instance. Otherwise, skip this step.

To stop the instance, select the instance and choose **Instance state, Stop instance**.

3. Select the instance and choose **Actions, Instance settings, Change resource based naming options**.
 - **Use resource based naming as guest OS hostname:** Determines whether you want the guest OS hostname of the EC2 instance to be the resource name or IP name.
 - **Answer DNS hostname IPv4 (A record) requests:** Determines whether DNS requests/queries to your resource name resolve to the private IPv4 address of this EC2 instance.

- **Answer DNS hostname IPv6 (AAAA record) requests:** Determines whether DNS requests/queries to your resource name resolve to the IPv6 address (AAAA record) of this EC2 instance.
4. Choose **Save**.
 5. If you stopped the instance, start it again.

Bring your own IP addresses (BYOIP) in Amazon EC2

You can bring part or all of your publicly routable IPv4 or IPv6 address range from your on-premises network to your AWS account. You continue to control the address range and you can advertise the address range on the internet through AWS. After you bring the address range to AWS, it appears in your AWS account as an address pool.

For a list of Regions where BYOIP is available, see [Regional availability](#).

To see BYOIP information for Linux instances, switch to this page in the *Amazon EC2 User Guide for Linux Instances* guide: [Bring your own IP addresses \(BYOIP\) in Amazon EC2](#).

Note

- The steps on this page describe how to bring your own IP address range for use in Amazon EC2 only.
- To bring your own IP address range for use in AWS Global Accelerator, see [Bring your own IP addresses \(BYOIP\)](#) in the *AWS Global Accelerator Developer Guide*.
- To bring your own IP address range for use with Amazon VPC IP Address Manager, see [Tutorial: Bring your IP addresses to IPAM](#) in the *Amazon VPC IPAM User Guide*.

Contents

- [BYOIP definitions](#)

- [Regional availability](#)
- [Local Zone availability](#)
- [Learn more](#)

BYOIP definitions

- **X.509 Self-sign certificate** — A certificate standard most commonly used to encrypt and authenticate data within a network. It is a certificate used by AWS to validate control over IP space from an RDAP record. For more information about X.509 certificates, see [RFC 3280](#).
- **Autonomous System Number (ASN)** – A globally unique identifier that defines a group of IP prefixes run by one or more network operators that maintain a single, clearly-defined routing policy.
- **Regional Internet Registry (RIR)** – An organization that manages allocation and registration of IP addresses and ASNs within a region of the world.
- **Registry Data Access Protocol (RDAP)** — A read-only protocol to query current registration data within a RIR. Entries within the queried RIR database are referred to as "RDAP records". Certain record types need to be updated by customers via a RIR-provided mechanism. These records are queried by AWS to verify control of an address space in the RIR.
- **Route Origin Authorization (ROA)** — An object created by RIRs for customers to authenticate IP advertisement in particular autonomous systems. For an overview, see [Route Origin Authorizations \(ROAs\)](#) on the ARIN website.
- **Local Internet Registry (LIR)** — Organizations such as internet service providers that allocate a block of IP addresses from an RIR for their customers.

Requirements and quotas

- The address range must be registered with your Regional Internet Registry (RIR). See your RIR for any policies regarding geographic regions. BYOIP currently supports registration in the American Registry for Internet Numbers (ARIN), Réseaux IP Européens Network Coordination Centre (RIPE), or Asia-Pacific Network Information Centre (APNIC). It must be registered to a business or institutional entity and cannot be registered to an individual person.
- The most specific IPv4 address range that you can bring is /24.
- The most specific IPv6 address range that you can bring is /48 for CIDRs that are publicly advertisable and /56 for CIDRs that are [not publicly advertisable](#).

- ROAs are not required for CIDR ranges that are not publicly advertisable, but the RDAP records still need to be updated.
- You can bring each address range to one AWS Region at a time.
- You can bring a total of five BYOIP IPv4 and IPv6 address ranges per AWS Region to your AWS account. You cannot adjust the quotas for BYOIP CIDRs using the Service Quotas console, but you can request a quota increase by contacting the AWS Support Center as described in [AWS service quotas](#) in the *AWS General Reference*.
- You cannot share your IP address range with other accounts using AWS RAM unless you use Amazon VPC IP Address Manager (IPAM) and integrate IPAM with AWS Organizations. For more information, see [Integrate IPAM with AWS Organizations](#) in the *Amazon VPC IPAM User Guide*.
- The addresses in the IP address range must have a clean history. We might investigate the reputation of the IP address range and reserve the right to reject an IP address range if it contains an IP address that has a poor reputation or is associated with malicious behavior.
- Legacy address space, the IPv4 address space that was distributed by the Internet Assigned Numbers Authority's (IANA) central registry prior to the formation of the Regional Internet Registry (RIR) system, still requires a corresponding ROA object.
- For LIRs, it is common that they use a manual process to update their records. This can take days to deploy depending on the LIR.
- A single ROA object and RDAP record are needed for a large CIDR block. You can bring multiple smaller CIDR blocks from that range to AWS, even across multiple AWS Regions, using the single object and record.
- BYOIP is not supported for Wavelength Zones or on AWS Outposts.
- Do not make any manual changes for BYOIP in RADb or any other IRR. BYOIP will automatically update RADb. Any manual changes that include the BYOIP ASN will cause the BYOIP provision operation to fail.

Onboarding prerequisites for your BYOIP address range

The onboarding process for BYOIP has two phases, for which you must perform three steps. These steps correspond to the steps depicted in the following diagram. We include manual steps in this documentation, but your RIR might offer managed services to help you with these steps.

Preparation phase

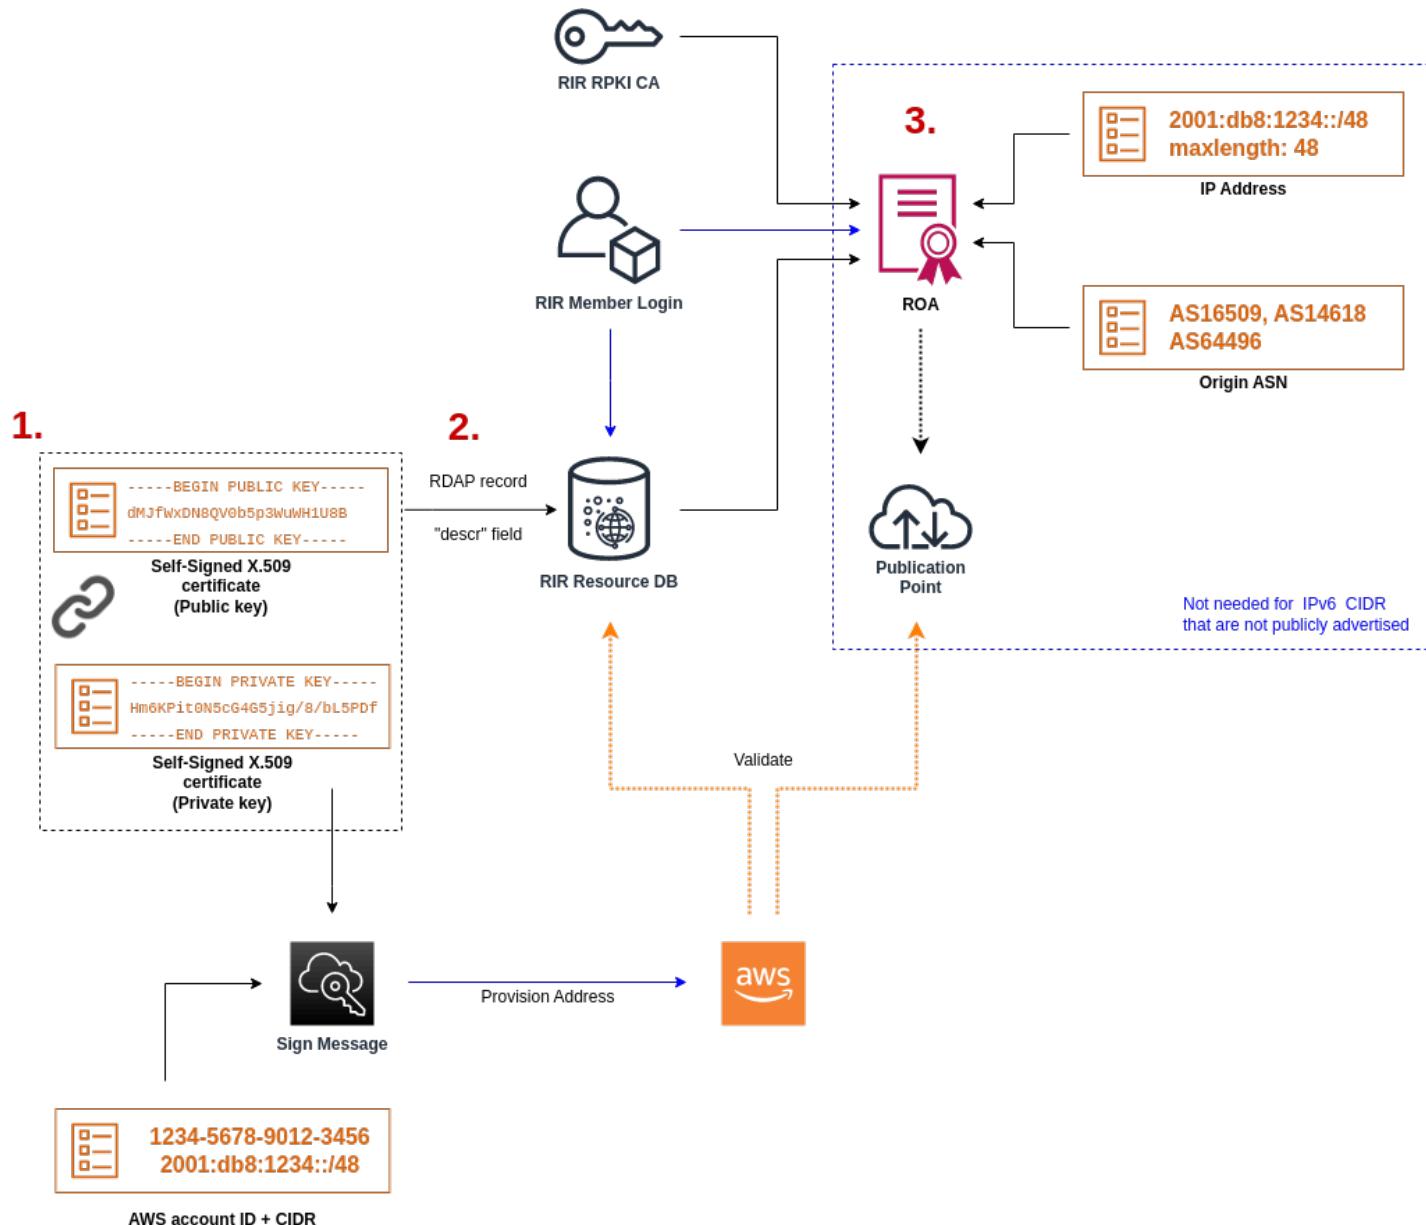

1. [Create a private key](#) and use it to generate a self-signed X.509 certificate for authentication purposes. This certificate is only used during the provisioning phase.

RIR configuration phase

2. [Upload the self-signed certificate](#) to your RDAP record comments.
3. [Create a ROA object](#) in your RIR. The ROA defines the desired address range, the Autonomous System Numbers (ASNs) allowed to advertise the address range, and an expiration date to register with the Resource Public Key Infrastructure (RPKI) of your RIR.

 **Note**

A ROA is not required for non-publicly advertisable IPv6 address space.

To bring on multiple non-contiguous address ranges, you must repeat this process with each address range. However, the preparation and RIR configuration steps don't need to be repeated if splitting a contiguous block across several different AWS Regions.

Bringing on an address range has no effect on any address ranges that you brought on previously.

⚠ Important

Before onboarding your address range, complete the following prerequisites. The tasks in this section require a Linux terminal and may be performed using Linux, the [AWS CloudShell](#), or the [Windows Subsystem for Linux](#).

1. Create a private key and generate an X.509 certificate

Use the following procedure to create a self-signed X.509 certificate and add it to the RDAP record for your RIR. This key pair is used to authenticate the address range with the RIR. The **openssl** commands require OpenSSL version 1.0.2 or later.

Copy the following commands and replace only the placeholder values (in colored italic text).

This procedure follows the best practice of encrypting your private RSA key and requiring a passphrase to access it.

1. Generate an RSA 2048-bit private key as shown in the following.

```
$ openssl genpkey -aes256 -algorithm RSA -pkeyopt rsa_keygen_bits:2048 -out  
private-key.pem
```

The **-aes256** parameter specifies the algorithm used to encrypt the private key. The command returns the following output, including prompts to set a passphrase:

```
.....++  
.++  
Enter PEM pass phrase: xxxxxx  
Verifying - Enter PEM pass phrase: xxxxxx
```

You can inspect the key using the following command:

```
$ openssl pkey -in private-key.pem -text
```

This returns a passphrase prompt and the contents of the key, which should be similar to the following:

```
Enter pass phrase for private-key.pem: xxxxxx
```

ad:00:51:52:e1:74:c2:5f:5b:10:cd:f1:05:74:6f:  
9a:77:5a:e5:87:d5:4f:01
```

Keep your private key in a secure location when it is not in use.

2. Generate an X.509 certificate using the private key created in the previous step. In this example, the certificate expires in 365 days, after which time it cannot be trusted. Be sure to set the expiration appropriately. The `tr -d "\n"` command strips newline characters (line breaks) from the output. You need to provide a Common Name when prompted, but the other fields can be left blank.

```
$ openssl req -new -x509 -key private-key.pem -days 365 | tr -d "\n" >  
certificate.pem
```

This results in output similar to the following:

```
Enter pass phrase for private-key.pem: xxxxxx
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.
-----
Country Name (2 letter code) []:
State or Province Name (full name) []:
Locality Name (eg, city) []:
Organization Name (eg, company) []:
Organizational Unit Name (eg, section) []:
Common Name (eg, fully qualified host name) []:example.com
Email Address []:
```

 **Note**

The Common Name is not needed for AWS provisioning. It can be any internal or public domain name.

You can inspect the certificate with the following command:

```
$ cat certificate.pem
```

The output should be a long, PEM-encoded string without line breaks, prefaced by -----
BEGIN CERTIFICATE----- and followed by -----END CERTIFICATE-----.

2. Upload the X.509 certificate to the RDAP record in your RIR

Add the certificate that you previously created to the RDAP record for your RIR. Be sure to include the -----BEGIN CERTIFICATE----- and -----END CERTIFICATE----- strings before and after the encoded portion. All of this content must be on a single, long line. The procedure for updating RDAP depends on your RIR:

- For ARIN, use the [Account Manager portal](#) to add the certificate in the "Public Comments" section for the "Network Information" object representing your address range. Do not add it to the comments section for your organization.
- For RIPE, add the certificate as a new "descr" field to the "inetnum" or "inet6num" object representing your address range. These can usually be found in the "My Resources" section of the [RIPE Database portal](#). Do not add it to the comments section for your organization or the "remarks" field of the above objects.
- For APNIC, email the certificate to helpdesk@apnic.net to manually add it to the "remarks" field for your address range. Send the email using the APNIC authorized contact for the IP addresses.

You can remove the certificate from your RIR's record after the provisioning stage below has been completed.

3. Create a ROA object in your RIR

Create a ROA object to authorize the Amazon ASNs 16509 and 14618 to advertise your address range, as well as the ASNs that are currently authorized to advertise the address range. For the AWS GovCloud (US) Regions, authorize ASN 8987 instead of 16509 and 14618. You must set the maximum length to the size of the CIDR that you are bringing in. The most specific IPv4 prefix you can bring is /24. The most specific IPv6 address range that you can bring is /48 for CIDRs that are publicly advertisable and /56 for CIDRs that are not publicly advertisable.

Important

If you are creating a ROA object for Amazon VPC IP Address Manager (IPAM), when you create the ROAs, for IPv4 CIDRs you must set the maximum length of an IP address prefix to /24. For IPv6 CIDRs, if you are adding them to an advertisable pool, the maximum length of an IP address prefix must be /48. This ensures that you have full flexibility to divide your public IP address across AWS Regions. IPAM enforces the maximum length you set. For more information about BYOIP addresses to IPAM, see [Tutorial: BYOIP address CIDRs to IPAM](#) in the *Amazon VPC IPAM User Guide*.

It might take up to 24 hours for the ROA to become available to Amazon. For more information, consult your RIR:

- ARIN — [ROA Requests](#)

- RIPE — [Managing ROAs](#)
- APNIC — [Route Management](#)

When you migrate advertisements from an on-premises workload to AWS, you must create a ROA for your existing ASN before creating the ROAs for Amazon's ASNs. Otherwise, you might see an impact to your existing routing and advertisements.

 **Important**

For Amazon to advertise and continue advertising your IP address range, your ROAs with Amazon ASNs must be compliant with the above guidelines. If your ROAs are not compliant, Amazon reserves the right to stop advertising your IP address range.

 **Note**

This step is not required for non-publicly advertisable IPv6 address space.

Onboard your BYOIP

The onboarding process for BYOIP has the following tasks depending on your needs:

Topics

- [Provision a publicly advertisable address range in AWS](#)
- [Provision an IPv6 address range that's not publicly advertisable](#)
- [Advertise the address range through AWS](#)
- [Deprovision the address range](#)

Provision a publicly advertisable address range in AWS

When you provision an address range for use with AWS, you are confirming that you control the address range and are authorizing Amazon to advertise it. We also verify that you control the address range through a signed authorization message. This message is signed with the self-signed X.509 key pair that you used when updating the RDAP record with the X.509 certificate.

AWS requires a cryptographically signed authorization message that it presents to the RIR. The RIR authenticates the signature against the certificate that you added to RDAP, and checks the authorization details against the ROA.

To provision the address range

1. Compose message

Compose the plaintext authorization message. The format of the message is as follows, where the date is the expiry date of the message:

```
1|aws|account|cidr|YYYYMMDD|SHA256|RSAPSS
```

Replace the account number, address range, and expiry date with your own values to create a message resembling the following:

```
text_message="1|aws|0123456789AB|198.51.100.0/24|20211231|SHA256|RSAPSS"
```

This is not to be confused with a ROA message, which has a similar appearance.

2. Sign message

Sign the plaintext message using the private key that you created previously. The signature returned by this command is a long string that you need to use in the next step.

Important

We recommend that you copy and paste this command. Except for the message content, do not modify or replace any of the values.

```
signed_message=$( echo -n $text_message | openssl dgst -sha256 -sigopt  
rsa_padding_mode:pss -sigopt rsa_pss_saltlen:-1 -sign private-key.pem -keyform PEM  
| openssl base64 | tr -- '+=/-' '_~' | tr -d "\n")
```

3. Provision address

Use the AWS CLI [provision-byoip-cidr](#) command to provision the address range. The `--cidr-authorization-context` option uses the message and signature strings that you created previously.

⚠️ Important

You must specify the AWS Region where the BYOIP range should be provisioned if it differs from your [AWS CLI configuration](#) Default region name.

```
aws ec2 provision-byoip-cidr --cidr address-range --cidr-authorization-context  
Message="$text_message",Signature="$signed_message" --region us-east-1
```

Provisioning an address range is an asynchronous operation, so the call returns immediately, but the address range is not ready to use until its status changes from pending-provision to provisioned.

4. Monitor progress

While most provisioning will be completed within two hours, it might take up to one week to complete the provisioning process for publicly advertisable ranges. Use the [describe-byoip-cidrs](#) command to monitor progress, as in this example:

```
aws ec2 describe-byoip-cidrs --max-results 5 --region us-east-1
```

If there are issues during provisioning and the status goes to failed-provision, you must run the provision-byoip-cidr command again after the issues have been resolved.

Provision an IPv6 address range that's not publicly advertisable

By default, an address range is provisioned to be publicly advertisable to the internet. You can provision an IPv6 address range that will not be publicly advertisable. For routes that are not publicly advertisable, the provisioning process generally completes within minutes. When you associate an IPv6 CIDR block from a non-public address range with a VPC, the IPv6 CIDR can only be accessed through hybrid connectivity options that support IPv6, such as [AWS Direct Connect](#), [AWS Site-to-Site VPN](#), or [Amazon VPC Transit Gateways](#).

A ROA is not required to provision a non-public address range.

Important

- You can only specify whether an address range is publicly advertisable during provisioning. You cannot change the advertisable status later on.
- Amazon VPC doesn't support [unique local address](#) (ULA) CIDRs. All VPCs must have unique IPv6 CIDRs. Two VPCs can't have the same IPv6 CIDR range.

To provision an IPv6 address range that will not be publicly advertisable, use the following [provision-byoip-cidr](#) command.

```
aws ec2 provision-byoip-cidr --cidr address-range --cidr-authorization-context  
Message="$text_message",Signature="$signed_message" --no-publicly-advertisable --  
region us-east-1
```

Advertise the address range through AWS

After the address range is provisioned, it is ready to be advertised. You must advertise the exact address range that you provisioned. You can't advertise only a portion of the provisioned address range.

If you provisioned an IPv6 address range that will not be publicly advertised, you do not need to complete this step.

We recommend that you stop advertising the address range from other locations before you advertise it through AWS. If you keep advertising your IP address range from other locations, we can't reliably support it or troubleshoot issues. Specifically, we can't guarantee that traffic to the address range will enter our network.

To minimize down time, you can configure your AWS resources to use an address from your address pool before it is advertised, and then simultaneously stop advertising it from the current location and start advertising it through AWS. For more information about allocating an Elastic IP address from your address pool, see [Allocate an Elastic IP address](#).

Limitations

- You can run the **advertise-byoip-cidr** command at most once every 10 seconds, even if you specify different address ranges each time.

- You can run the **withdraw-byoip-cidr** command at most once every 10 seconds, even if you specify different address ranges each time.

To advertise the address range, use the following [advertise-byoip-cidr](#) command.

```
aws ec2 advertise-byoip-cidr --cidr address-range --region us-east-1
```

To stop advertising the address range, use the following [withdraw-byoip-cidr](#) command.

```
aws ec2 withdraw-byoip-cidr --cidr address-range --region us-east-1
```

Deprovision the address range

To stop using your address range with AWS, first release any Elastic IP addresses and disassociate any IPv6 CIDR blocks that are still allocated from the address pool. Then stop advertising the address range, and finally, deprovision the address range.

You cannot deprovision a portion of the address range. If you want to use a more specific address range with AWS, deprovision the entire address range and provision a more specific address range.

(IPv4) To release each Elastic IP address, use the following [release-address](#) command.

```
aws ec2 release-address --allocation-id eipalloc-12345678abca --region us-east-1
```

(IPv6) To disassociate an IPv6 CIDR block, use the following [disassociate-vpc-cidr-block](#) command.

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-12345abcd1234abc1 --region us-east-1
```

To stop advertising the address range, use the following [withdraw-byoip-cidr](#) command.

```
aws ec2 withdraw-byoip-cidr --cidr address-range --region us-east-1
```

To deprovision the address range, use the following [deprovision-byoip-cidr](#) command.

```
aws ec2 deprovision-byoip-cidr --cidr address-range --region us-east-1
```

It can take up to a day to deprovision an address range.

Work with your address range

You can view and use the IPv4 and IPv6 address ranges that you've provisioned in your account.

IPv4 address ranges

You can create an Elastic IP address from your IPv4 address pool and use it with your AWS resources, such as EC2 instances, NAT gateways, and Network Load Balancers.

To view information about the IPv4 address pools that you've provisioned in your account, use the following [describe-public-ipv4-pools](#) command.

```
aws ec2 describe-public-ipv4-pools --region us-east-1
```

To create an Elastic IP address from your IPv4 address pool, use the [allocate-address](#) command. You can use the `--public-ipv4-pool` option to specify the ID of the address pool returned by `describe-byoip-cidrs`. Or you can use the `--address` option to specify an address from the address range that you provisioned.

IPv6 address ranges

To view information about the IPv6 address pools that you've provisioned in your account, use the following [describe-ipv6-pools](#) command.

```
aws ec2 describe-ipv6-pools --region us-east-1
```

To create a VPC and specify an IPv6 CIDR from your IPv6 address pool, use the following [create-vpc](#) command. To let Amazon choose the IPv6 CIDR from your IPv6 address pool, omit the `--ipv6-cidr-block` option.

```
aws ec2 create-vpc --cidr-block 10.0.0.0/16 --ipv6-cidr-block ipv6-cidr --ipv6-pool pool-id --region us-east-1
```

To associate an IPv6 CIDR block from your IPv6 address pool with a VPC, use the following [associate-vpc-cidr-block](#) command. To let Amazon choose the IPv6 CIDR from your IPv6 address pool, omit the `--ipv6-cidr-block` option.

```
aws ec2 associate-vpc-cidr-block --vpc-id vpc-123456789abc123ab --ipv6-cidr-block ipv6-cidr --ipv6-pool pool-id --region us-east-1
```

To view your VPCs and the associated IPv6 address pool information, use the [describe-vpcs](#) command. To view information about associated IPv6 CIDR blocks from a specific IPv6 address pool, use the following [get-associated-ipv6-pool-cidrs](#) command.

```
aws ec2 get-associated-ipv6-pool-cidrs --pool-id pool-id --region us-east-1
```

If you disassociate the IPv6 CIDR block from your VPC, it's released back into your IPv6 address pool.

Validate your BYOIP

1. Validate the self-signed x.509 key pair

Validate that the certificate has been uploaded and is valid via the whois command.

For ARIN, use `whois -h whois.arin.net r + 2001:0DB8:6172::/48` to look up the RDAP record for your address range. Check the Public Comments section for the NetRange (network range) in the command output. The certificate should be added in the Public Comments section for the address range.

You can inspect the Public Comments containing the certificate using the following command:

```
whois -h whois.arin.net r + 2001:0DB8:6172::/48 | grep Comments | grep BEGIN
```

This returns output with the contents of the key, which should be similar to the following:

```
Public Comments:

```

2. Validate the creation of a ROA object

Validate the successful creation of the ROA objects using the RIPEstat Data API. Be sure to test your address range against the Amazon ASNs 16509 and 14618, plus the ASNs that are currently authorized to advertise the address range.

You can inspect the ROA objects from different Amazon ASNs with your address range by using the following command:

```
curl --location --request GET "https://stat.ripe.net/data/rpki-validation/data.json?  
resource=ASN&prefix=CIDR
```

In this example output, the response has a result of "status": "valid" for the Amazon ASN 16509. This indicates the ROA object for the address range was created successfully:

```
{  
    "messages": [],  
    "see_also": [],  
    "version": "0.3",  
    "data_call_name": "rpki-validation",  
    "data_call_status": "supported",  
    "cached": false,  
    "data": {  
        "validating_roas": [  
            {  
                "origin": "16509",  
                "prefix": "2001:0DB8::/32",  
                "max_length": 48,  
                "validity": "valid"  
            },  
            {  
                "origin": "14618",  
                "prefix": "2001:0DB8::/32",  
                "max_length": 48,  
                "validity": "invalid_asn"  
            },  
            {  
                "origin": "64496",  
                "prefix": "2001:0DB8::/32",  
                "max_length": 48,  
                "validity": "invalid_asn"  
            }  
        ],  
    }  
}
```

```
        "status": "valid",
        "validator": "routinator",
        "resource": "16509",
        "prefix": "2001:0DB8::/32"
    },
    "query_id": "20230224152430-81e6384e-21ba-4a86-852a-31850787105f",
    "process_time": 58,
    "server_id": "app116",
    "build_version": "live.2023.2.1.142",
    "status": "ok",
    "status_code": 200,
    "time": "2023-02-24T15:24:30.773654"
}
```

A status of “unknown” indicates the ROA object for the address range has not been created. A status of “invalid_asn” indicates that the ROA object for the address range was not created successfully.

Regional availability

The BYOIP feature is currently available in all commercial [AWS Regions](#) except for China Regions.

Local Zone availability

A [Local Zone](#) is an extension of an AWS Region in geographic proximity to your users. Local Zones are grouped into "network border groups". In AWS, a network border group is a collection of Availability Zones (AZs), Local Zones, or Wavelength Zones from which AWS advertises a public IP address. Local Zones may have different network border groups than the AZs in an AWS Region to ensure minimum latency or physical distance between the AWS network and the customers accessing the resources in these Zones.

You can provision BYOIPv4 address ranges to and advertise them in the following Local Zone network border groups using the --network-border-group option:

- us-east-1-dfw-2
- us-west-2-lax-1
- us-west-2-phx-2

If you have Local Zones enabled (see [Enable a Local Zone](#)), you can choose a network border group for Local Zones when you provision and advertise a BYOIPv4 CIDR. Choose the network border group carefully as the EIP and the AWS resource it is associated with must reside in the same network border group.

 **Note**

You cannot provision or advertise BYOIPv6 address ranges in Local Zones at this time.

Learn more

For more information, see the AWS Online Tech talk [Deep Dive on Bring Your Own IP](#).

Elastic IP addresses

An *Elastic IP address* is a static IPv4 address designed for dynamic cloud computing. An Elastic IP address is allocated to your AWS account, and is yours until you release it. By using an Elastic IP address, you can mask the failure of an instance or software by rapidly remapping the address to another instance in your account. Alternatively, you can specify the Elastic IP address in a DNS record for your domain, so that your domain points to your instance. For more information, see the documentation for your domain registrar.

An Elastic IP address is a public IPv4 address, which is reachable from the internet. If your instance does not have a public IPv4 address, you can associate an Elastic IP address with your instance to enable communication with the internet. For example, this allows you to connect to your instance from your local computer.

Contents

- [Elastic IP address pricing](#)
- [Elastic IP address basics](#)
- [Work with Elastic IP addresses](#)
- [Elastic IP address quota](#)

Elastic IP address pricing

AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the **Public IPv4 Address** tab on the [Amazon VPC pricing page](#).

Elastic IP address basics

The following are the basic characteristics of an Elastic IP address:

- An Elastic IP address is static; it does not change over time.
- An Elastic IP address is for use in a specific Region only, and cannot be moved to a different Region.
- An Elastic IP address comes from Amazon's pool of IPv4 addresses, or from a custom IPv4 address pool that you have brought to your AWS account.
- To use an Elastic IP address, you first allocate one to your account, and then associate it with your instance or a network interface.
- When you associate an Elastic IP address with an instance, it is also associated with the instance's primary network interface. When you associate an Elastic IP address with a network interface that is attached to an instance, it is also associated with the instance.
- When you associate an Elastic IP address with an instance or its primary network interface, the instance's public IPv4 address (if it had one) is released back into Amazon's pool of public IPv4 addresses. You cannot reuse a public IPv4 address, and you cannot convert a public IPv4 address to an Elastic IP address. For more information, see [Public IPv4 addresses](#).
- You can disassociate an Elastic IP address from a resource, and then associate it with a different resource. To avoid unexpected behavior, ensure that all active connections to the resource named in the existing association are closed before you make the change. After you have associated your Elastic IP address to a different resource, you can reopen your connections to the newly associated resource.
- A disassociated Elastic IP address remains allocated to your account until you explicitly release it. We impose a small hourly charge for Elastic IP addresses that are not associated with a running instance.
- When you associate an Elastic IP address with an instance that previously had a public IPv4 address, the public DNS host name of the instance changes to match the Elastic IP address.

- We resolve a public DNS host name to the public IPv4 address or the Elastic IP address of the instance outside the network of the instance, and to the private IPv4 address of the instance from within the network of the instance.
- When you allocate an Elastic IP address from an IP address pool that you have brought to your AWS account, it does not count toward your Elastic IP address limits. For more information, see [Elastic IP address quota](#).
- When you allocate the Elastic IP addresses, you can associate the Elastic IP addresses with a network border group. This is the location from which we advertise the CIDR block. Setting the network border group limits the CIDR block to this group. If you do not specify the network border group, we set the border group containing all of the Availability Zones in the Region (for example, us-west-2).
- An Elastic IP address is for use in a specific network border group only.

Work with Elastic IP addresses

The following sections describe how you can work with Elastic IP addresses.

Tasks

- [Allocate an Elastic IP address](#)
- [Describe your Elastic IP addresses](#)
- [Tag an Elastic IP address](#)
- [Associate an Elastic IP address with an instance or network interface](#)
- [Disassociate an Elastic IP address](#)
- [Transfer Elastic IP addresses](#)
- [Release an Elastic IP address](#)
- [Recover an Elastic IP address](#)
- [Use reverse DNS for email applications](#)

Allocate an Elastic IP address

You can allocate an Elastic IP address from Amazon's pool of public IPv4 addresses, or from a custom IP address pool that you have brought to your AWS account. For more information about bringing your own IP address range to your AWS account, see [Bring your own IP addresses \(BYOIP\) in Amazon EC2](#).

You can allocate an Elastic IP address using one of the following methods.

Console

To allocate an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network & Security, Elastic IPs**.
3. Choose **Allocate Elastic IP address**.
4. (Optional) When you allocate an Elastic IP address (EIP), you choose the **Network border group** in which to allocate the EIP. A network border group is a collection of Availability Zones (AZs), Local Zones, or Wavelength Zones from which AWS advertises a public IP address. Local Zones and Wavelength Zones may have different network border groups than the AZs in a Region to ensure minimum latency or physical distance between the AWS network and the customers accessing the resources in these Zones.

 **Important**

You must allocate an EIP in the same network border group as the AWS resource that will be associated with the EIP. An EIP in one network border group can only be advertised in zones in that network border group and not in any other zones represented by other network border groups.

If you have Local Zones or Wavelength Zones enabled (for more information, see [Enable a Local Zone](#) or [Enable Wavelength Zones](#)), you can choose a network border group for AZs, Local Zones, or Wavelength Zones. Choose the network border group carefully as the EIP and the AWS resource it is associated with must reside in the same network border group. You can use the EC2 console to view the network border group that your Availability Zones, Local Zones, or Wavelength Zones are in (see [Local Zones](#)). Typically, all Availability Zones in a Region belong to the same network border group, whereas Local Zones or Wavelength Zones belong to their own separate network border groups.

If you don't have Local Zones or Wavelength Zones enabled, when you allocate an EIP, the network border group that represents all of the AZs for the Region (such as us-west-2) is predefined for you and you cannot change it. This means that the EIP that you allocate to this network border group will be advertised in all AZs in the Region you're in.

5. For **Public IPv4 address pool**, choose one of the following:
 - **Amazon's pool of IPv4 addresses**—If you want an IPv4 address to be allocated from Amazon's pool of IPv4 addresses.
 - **Public IPv4 address that you bring to your AWS account**—If you want to allocate an IPv4 address from an IP address pool that you have brought to your AWS account. This option is disabled if you do not have any IP address pools.
 - **Customer owned pool of IPv4 addresses**—If you want to allocate an IPv4 address from a pool created from your on-premises network for use with an AWS Outpost. This option is disabled if you do not have an AWS Outpost.

6. (Optional) Add or remove a tag.

[Add a tag] Choose **Add new tag** and do the following:

- For **Key**, enter the key name.
- For **Value**, enter the key value.

[Remove a tag] Choose **Remove** to the right of the tag's Key and Value.

7. Choose **Allocate**.

AWS CLI

To allocate an Elastic IP address

Use the [allocate-address](#) AWS CLI command.

PowerShell

To allocate an Elastic IP address

Use the [New-EC2Address](#) AWS Tools for Windows PowerShell command.

Describe your Elastic IP addresses

You can describe an Elastic IP address using one of the following methods.

Console

To describe your Elastic IP addresses

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to view and choose **Actions, View details**.

AWS CLI

To describe your Elastic IP addresses

Use the [describe-addresses](#) AWS CLI command.

PowerShell

To describe your Elastic IP addresses

Use the [Get-EC2Address](#) AWS Tools for Windows PowerShell command.

Tag an Elastic IP address

You can assign custom tags to your Elastic IP addresses to categorize them in different ways, for example, by purpose, owner, or environment. This helps you to quickly find a specific Elastic IP address based on the custom tags that you assigned to it.

Cost allocation tracking using Elastic IP address tags is not supported.

You can tag an Elastic IP address using one of the following methods.

Console

To tag an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to tag and choose **Actions, View details**.
4. In the **Tags** section, choose **Manage tags**.
5. Specify a tag key and value pair.
6. (Optional) Choose **Add tag** to add additional tags.

7. Choose Save.

AWS CLI

To tag an Elastic IP address

Use the [create-tags](#) AWS CLI command.

```
aws ec2 create-tags --resources eipalloc-12345678 --tags Key=Owner,Value=TeamA
```

PowerShell

To tag an Elastic IP address

Use the [New-EC2Tag](#) AWS Tools for Windows PowerShell command.

The New-EC2Tag command needs a Tag parameter, which specifies the key and value pair to be used for the Elastic IP address tag. The following commands create the Tag parameter.

```
PS C:\> $tag = New-Object Amazon.EC2.Model.Tag  
PS C:\> $tag.Key = "Owner"  
PS C:\> $tag.Value = "TeamA"
```

```
PS C:\> New-EC2Tag -Resource eipalloc-12345678 -Tag $tag
```

Associate an Elastic IP address with an instance or network interface

If you're associating an Elastic IP address with your instance to enable communication with the internet, you must also ensure that your instance is in a public subnet. For more information, see [Internet gateways](#) in the *Amazon VPC User Guide*.

You can associate an Elastic IP address with an instance or network interface using one of the following methods.

Console

To associate an Elastic IP address with an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.

3. Select the Elastic IP address to associate and choose **Actions, Associate Elastic IP address**.
4. For **Resource type**, choose **Instance**.
5. For instance, choose the instance with which to associate the Elastic IP address. You can also enter text to search for a specific instance.
6. (Optional) For **Private IP address**, specify a private IP address with which to associate the Elastic IP address.
7. Choose **Associate**.

To associate an Elastic IP address with a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to associate and choose **Actions, Associate Elastic IP address**.
4. For **Resource type**, choose **Network interface**.
5. For **Network interface**, choose the network interface with which to associate the Elastic IP address. You can also enter text to search for a specific network interface.
6. (Optional) For **Private IP address**, specify a private IP address with which to associate the Elastic IP address.
7. Choose **Associate**.

AWS CLI

To associate an Elastic IP address

Use the [associate-address](#) AWS CLI command.

PowerShell

To associate an Elastic IP address

Use the [Register-EC2Address](#) AWS Tools for Windows PowerShell command.

Disassociate an Elastic IP address

You can disassociate an Elastic IP address from an instance or network interface at any time. After you disassociate the Elastic IP address, you can reassociate it with another resource.

You can disassociate an Elastic IP address using one of the following methods.

Console

To disassociate and reassociate an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to disassociate, choose **Actions, Disassociate Elastic IP address**.
4. Choose **Disassociate**.

AWS CLI

To disassociate an Elastic IP address

Use the [disassociate-address](#) AWS CLI command.

PowerShell

To disassociate an Elastic IP address

Use the [Unregister-EC2Address](#) AWS Tools for Windows PowerShell command.

Transfer Elastic IP addresses

This section describes how to transfer Elastic IP addresses from one AWS account to another. Transferring Elastic IP addresses can be helpful in the following situations:

- **Organizational restructuring** – Use Elastic IP address transfers to quickly move workloads from one AWS account to another. You don't have to wait for new Elastic IP addresses to be allowlisted in your security groups and NACLs.
- **Centralized security administration** – Use a centralized AWS security account to track and transfer Elastic IP addresses that have been vetted for security compliance.
- **Disaster recovery** – Use Elastic IP address transfers to quickly remap IPs for public-facing internet workloads during emergency events.

There is no charge for transferring Elastic IP addresses.

Tasks

- [Enable Elastic IP address transfer](#)
- [Disable Elastic IP address transfer](#)
- [Accept a transferred Elastic IP address](#)

Enable Elastic IP address transfer

This section describes how to accept a transferred Elastic IP address. Note the following limitations related to enabling Elastic IP addresses for transfer:

- You can transfer Elastic IP addresses from any AWS account (source account) to any other AWS account in the same AWS Region (transfer account).
- When you transfer an Elastic IP address, there is a two-step handshake between the AWS accounts. When the source account starts the transfer, the transfer accounts have seven days to accept the Elastic IP address transfer. During those seven days, the source account can view the pending transfer (for example in the AWS console or by using the [describe-address-transfers](#) AWS CLI command). After seven days, the transfer expires and ownership of the Elastic IP address returns to the source account.
- Accepted transfers are visible to the source account (for example in the AWS console or by using the [describe-address-transfers](#) AWS CLI command) for three days after the transfers have been accepted.
- AWS does not notify transfer accounts about pending Elastic IP address transfer requests. The owner of the source account must notify the owner of the transfer account that there is an Elastic IP address transfer request that they must accept.
- Any tags that are associated with an Elastic IP address being transferred are reset when the transfer is complete.
- You cannot transfer Elastic IP addresses allocated from public IPv4 address pools that you bring to your AWS account – commonly referred to as Bring Your Own IP (BYOIP) address pools.
- If you attempt to transfer an Elastic IP address that has a reverse DNS record associated with it, you can begin the transfer process, but the transfer account will not be able to accept the transfer until the associated DNS record is removed.
- If you have enabled and configured AWS Outposts, you might have allocated Elastic IP addresses from a customer-owned IP address pool (CoIP). You cannot transfer Elastic IP addresses allocated from a CoIP. However, you can use AWS RAM to share a CoIP with another account. For more information, see [Customer-owned IP addresses](#) in the *AWS Outposts User Guide*.

- You can use Amazon VPC IPAM to track the transfer of Elastic IP addresses to accounts in an organization from AWS Organizations. For more information, see [View IP address history](#). If an Elastic IP address is transferred to an AWS account outside of the organization, the IPAM audit history of the Elastic IP address is lost.

These steps must be completed by the source account.

Console

To enable Elastic IP address transfer

1. Ensure that you're using the source AWS account.
2. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
3. In the navigation pane, choose **Elastic IPs**.
4. Select one or more Elastic IP address to enable for transfer and choose **Actions, Enable transfer**.
5. If you are transferring multiple Elastic IP addresses, you'll see the **Transfer type** option. Choose one of the following options:
 - Choose **Single account** if you are transferring the Elastic IP addresses to a single AWS account.
 - Choose **Multiple accounts** if you are transferring the Elastic IP addresses to multiple AWS accounts.
6. Under **Transfer account ID**, enter the IDs of the AWS accounts that you want to transfer the Elastic IP addresses to.
7. Confirm the transfer by entering **enable** in the text box.
8. Choose **Submit**.
9. To accept the transfer, see [Accept a transferred Elastic IP address](#). To disable the transfer, see [Disable Elastic IP address transfer](#).

AWS CLI

To enable Elastic IP address transfer

Use the [enable-address-transfer](#) command.

PowerShell

To enable Elastic IP address transfer

Use the [Enable-EC2AddressTransfer](#) command.

Disable Elastic IP address transfer

This section describes how to disable an Elastic IP transfer after the transfer has been enabled.

These steps must be completed by the source account that enabled the transfer.

Console

To disable an Elastic IP address transfer

1. Ensure that you're using the source AWS account.
2. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
3. In the navigation pane, choose **Elastic IPs**.
4. In the resource list of Elastic IPs, ensure that you have the property enabled that shows the column **Transfer status**.
5. Select one or more Elastic IP address that have a **Transfer status of Pending**, and choose **Actions, Disable transfer**.
6. Confirm by entering **disable** in the text box.
7. Choose **Submit**.

AWS CLI

To disable Elastic IP address transfer

Use the [disable-address-transfer](#) command.

PowerShell

To disable Elastic IP address transfer

Use the [Disable-EC2AddressTransfer](#) command.

Accept a transferred Elastic IP address

This section describes how to accept a transferred Elastic IP address.

When you transfer an Elastic IP address, there is a two-step handshake between the AWS accounts. When the source account starts the transfer, the transfer accounts have seven days to accept the Elastic IP address transfer. During those seven days, the source account can view the pending transfer (for example in the AWS console or by using the [describe-address-transfers](#) AWS CLI command). After seven days, the transfer expires and ownership of the Elastic IP address returns to the source account.

When accepting transfers, note the following exceptions that might occur and how to resolve them:

- **AddressLimitExceeded:** If your transfer account has exceeded the Elastic IP address quota, the source account can enable Elastic IP address transfer, but this exception occurs when the transfer account tries to accept the transfer. By default, all AWS accounts are limited to 5 Elastic IP addresses per Region. See [Elastic IP address quota](#) for instructions on increasing the limit.
- **InvalidTransfer.AddressCustomPtrSet:** If you or someone in your organization has configured the Elastic IP address that you are attempting to transfer to use reverse DNS lookup, the source account can enable transfer for the Elastic IP address, but this exception occurs when the transfer account tries to accept the transfer. To resolve this issue, the source account must remove the DNS record for the Elastic IP address. For more information, see [Use reverse DNS for email applications](#).
- **InvalidTransfer.AddressAssociated:** If an Elastic IP address is associated with an ENI or EC2 instance, the source account can enable transfer for the Elastic IP address, but this exception occurs when the transfer account tries to accept the transfer. To resolve this issue, the source account must disassociate the Elastic IP address. For more information, see [Disassociate an Elastic IP address](#).

For any other exceptions, [contact AWS Support](#).

These steps must be completed by the transfer account.

Console

To accept an Elastic IP address transfer

1. Ensure that you're using the transfer account.

2. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
3. In the navigation pane, choose **Elastic IPs**.
4. Choose **Actions, Accept transfer**.
5. No tags that are associated with the Elastic IP address being transferred are transferred with the Elastic IP address when you accept the transfer. If you want to define a **Name** tag for the Elastic IP address that you are accepting, select **Create a tag with a key of 'Name' and a value that you specify**.
6. Enter the Elastic IP address that you want to transfer.
7. If you are accepting multiple transferred Elastic IP addresses, choose **Add address** to enter an additional Elastic IP address.
8. Choose **Submit**.

AWS CLI

To accept an Elastic IP address transfer

Use the [accept-address-transfer](#) command.

PowerShell

To accept an Elastic IP address transfer

Use the [Approve-EC2AddressTransfer](#) command.

Release an Elastic IP address

If you no longer need an Elastic IP address, we recommend that you release it using one of the following methods. The address to release must not be currently associated with an AWS resource, such as an EC2 instance, NAT gateway, or Network Load Balancer.

Note

If you contacted AWS support to set up reverse DNS for an Elastic IP (EIP) address, you can remove the reverse DNS, but you can't release the Elastic IP address because it's been locked by AWS support. To unlock the Elastic IP address, contact [AWS Support](#). Once the Elastic IP address is unlocked, you can release the Elastic IP address.

Console

To release an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to release and choose **Actions, Release Elastic IP addresses**.
4. Choose **Release**.

AWS CLI

To release an Elastic IP address

Use the [release-address](#) AWS CLI command.

PowerShell

To release an Elastic IP address

Use the [Remove-EC2Address](#) AWS Tools for Windows PowerShell command.

Recover an Elastic IP address

If you have released your Elastic IP address, you might be able to recover it. The following rules apply:

- You cannot recover an Elastic IP address if it has been allocated to another AWS account, or if it will result in your exceeding your Elastic IP address limit.
- You cannot recover tags associated with an Elastic IP address.
- You can recover an Elastic IP address using the Amazon EC2 API or a command line tool only.

AWS CLI

To recover an Elastic IP address

Use the [allocate-address](#) AWS CLI command and specify the IP address using the `--address` parameter as follows.

```
aws ec2 allocate-address --domain vpc --address 203.0.113.3
```

PowerShell

To recover an Elastic IP address

Use the [New-EC2Address](#) AWS Tools for Windows PowerShell command and specify the IP address using the `-Address` parameter as follows.

```
PS C:\> New-EC2Address -Address 203.0.113.3 -Domain vpc -Region us-east-1
```

Use reverse DNS for email applications

If you intend to send email to third parties from an instance, we recommend that you provision one or more Elastic IP addresses and assign static reverse DNS records to the Elastic IP addresses that you use to send email. This can help you avoid having your email flagged as spam by some anti-spam organizations. AWS works with ISPs and internet anti-spam organizations to reduce the chance that your email sent from these addresses will be flagged as spam.

Considerations

- Before you create a reverse DNS record, you must set a corresponding forward DNS record (record type A) that points to your Elastic IP address.
- If a reverse DNS record is associated with an Elastic IP address, the Elastic IP address is locked to your account and cannot be released from your account until the record is removed.
- **AWS GovCloud (US) Region**

You can't create a reverse DNS record using the console or AWS CLI. AWS must assign the static reverse DNS records for you. Open [Request to remove reverse DNS and email sending limitations](#) and provide us with your Elastic IP addresses and reverse DNS records.

Create a reverse DNS record

To create a reverse DNS record, choose the tab that matches your preferred method.

Console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address and choose **Actions, Update reverse DNS**.

4. For **Reverse DNS domain name**, enter the domain name.
5. Enter **update** to confirm.
6. Choose **Update**.

AWS CLI

Use the [modify-address-attribute](#) command in the AWS CLI, as shown in the following example:

```
aws ec2 modify-address-attribute --allocation-id eipalloc-abcdef01234567890 --  
domain-name example.com  
{  
    "Addresses": [  
        {  
            "PublicIp": "192.0.2.0",  
            "AllocationId": "eipalloc-abcdef01234567890",  
            "PtrRecord": "example.net.",  
            "PtrRecordUpdate": {  
                "Value": "example.com.",  
                "Status": "PENDING"  
            }  
        ]  
    }  
}
```

Remove a reverse DNS record

To remove a reverse DNS record, choose the tab that matches your preferred method.

Console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address and choose **Actions, Update reverse DNS**.
4. For **Reverse DNS domain name**, clear the domain name.
5. Enter **update** to confirm.
6. Choose **Update**.

AWS CLI

Use the [reset-address-attribute](#) command in the AWS CLI, as shown in the following example:

```
aws ec2 reset-address-attribute --allocation-id eipalloc-abcdef01234567890 --  
attribute domain-name  
{  
    "Addresses": [  
        {  
            "PublicIp": "192.0.2.0",  
            "AllocationId": "eipalloc-abcdef01234567890",  
            "PtrRecord": "example.com.",  
            "PtrRecordUpdate": {  
                "Value": "example.net.",  
                "Status": "PENDING"  
            }  
        }  
    ]  
}
```

 **Note**

If you receive the following error when you run the command, you can submit a [Request to remove email sending limitations](#) to AWS Support for assistance.

The address with allocation id cannot be released because it is locked to your account.

Elastic IP address quota

By default, all AWS accounts have a quota of five (5) Elastic IP addresses per Region, because public (IPv4) internet addresses are a scarce public resource. We strongly encourage you to use an Elastic IP address primarily for the ability to remap the address to another instance in the case of instance failure, and to use [DNS hostnames](#) for all other inter-node communication.

To verify how many Elastic IP addresses are in use

Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/> and choose **Elastic IPs** from the navigation pane.

To verify your current account quota for Elastic IP addresses

1. Open the Service Quotas console at <https://console.aws.amazon.com/servicequotas/>.

2. From the navigation bar (at the top of the screen), select a Region.
3. On the Dashboard, choose **Amazon Elastic Compute Cloud (Amazon EC2)**.
If Amazon Elastic Compute Cloud (Amazon EC2) is not listed on the Dashboard, choose **AWS services**, enter **EC2** in the search field, and then choose **Amazon Elastic Compute Cloud (Amazon EC2)**.
4. On the Amazon EC2 service quotas page, enter **IP** in the search field. The limit is **EC2-VPC Elastic IPs**. For more information, choose the limit.

If you think your architecture warrants additional Elastic IP addresses, you can request a quota increase directly from the Service Quotas console. To request a quota increase, choose **Request increase at account-level**. For more information, see [Amazon EC2 service quotas](#).

Elastic network interfaces

An *elastic network interface* is a logical networking component in a VPC that represents a virtual network card. It can include the following attributes:

- A primary private IPv4 address from the IPv4 address range of your VPC
- A primary IPv6 address from the IPv6 address range of your VPC
- One or more secondary private IPv4 addresses from the IPv4 address range of your VPC
- One Elastic IP address (IPv4) per private IPv4 address
- One public IPv4 address
- One or more IPv6 addresses
- One or more security groups
- A MAC address
- A source/destination check flag
- A description

You can create and configure network interfaces and attach them to instances in the same Availability Zone. Your account might also have *requester-managed* network interfaces, which are created and managed by AWS services to enable you to use other resources and services. You cannot manage these network interfaces yourself. For more information, see [Requester-managed network interfaces](#).

This AWS resource is referred to as a *network interface* in the AWS Management Console and the Amazon EC2 API. Therefore, we use "network interface" in this documentation instead of "elastic network interface". The term "network interface" in this documentation always means "elastic network interface".

Contents

- [Network interface basics](#)
- [IP addresses per network interface per instance type](#)
- [Work with network interfaces](#)
- [Best practices for configuring network interfaces](#)
- [Scenarios for network interfaces](#)
- [Requester-managed network interfaces](#)
- [Assign prefixes to Amazon EC2 network interfaces](#)

Network interface basics

You can create a network interface, attach it to an instance, detach it from an instance, and attach it to another instance. The attributes of a network interface follow it as it's attached or detached from an instance and reattached to another instance. When you move a network interface from one instance to another, network traffic is redirected to the new instance.

Primary network interface

Each instance has a default network interface, called the *primary network interface*. You cannot detach a primary network interface from an instance. You can create and attach additional network interfaces. The maximum number of network interfaces that you can use varies by instance type. For more information, see [IP addresses per network interface per instance type](#).

Public IPv4 addresses for network interfaces

In a VPC, all subnets have a modifiable attribute that determines whether network interfaces created in that subnet (and therefore instances launched into that subnet) are assigned a public IPv4 address. For more information, see [Subnet settings](#) in the *Amazon VPC User Guide*. The public IPv4 address is assigned from Amazon's pool of public IPv4 addresses. When you launch an instance, the IP address is assigned to the primary network interface that's created.

When you create a network interface, it inherits the public IPv4 addressing attribute from the subnet. If you later modify the public IPv4 addressing attribute of the subnet, the network

interface keeps the setting that was in effect when it was created. If you launch an instance and specify an existing network interface as the primary network interface, the public IPv4 address attribute is determined by this network interface.

For more information, see [Public IPv4 addresses](#).

Elastic IP addresses for network interface

If you have an Elastic IP address, you can associate it with one of the private IPv4 addresses for the network interface. You can associate one Elastic IP address with each private IPv4 address.

If you disassociate an Elastic IP address from a network interface, you can release it back to the address pool. This is the only way to associate an Elastic IP address with an instance in a different subnet or VPC, as network interfaces are specific to subnets.

IPv6 addresses for network interfaces

If you associate IPv6 CIDR blocks with your VPC and subnet, you can assign one or more IPv6 addresses from the subnet range to a network interface. Each IPv6 address can be assigned to one network interface.

All subnets have a modifiable attribute that determines whether network interfaces created in that subnet (and therefore instances launched into that subnet) are automatically assigned an IPv6 address from the range of the subnet. For more information, see [Subnet settings](#) in the *Amazon VPC User Guide*. When you launch an instance, the IPv6 address is assigned to the primary network interface that's created.

For more information, see [IPv6 addresses](#).

Prefix Delegation

A Prefix Delegation prefix is a reserved private IPv4 or IPv6 CIDR range that you allocate for automatic or manual assignment to network interfaces that are associated with an instance. By using Delegated Prefixes, you can launch services faster by assigning a range of IP addresses as a single prefix.

Termination behavior

You can set the termination behavior for a network interface that's attached to an instance. You can specify whether the network interface should be automatically deleted when you terminate the instance to which it's attached.

Source/destination checking

You can enable or disable source/destination checks, which ensure that the instance is either the source or the destination of any traffic that it receives. Source/destination checks are enabled by default. You must disable source/destination checks if the instance runs services such as network address translation, routing, or firewalls.

Monitoring IP traffic

You can enable a VPC flow log on your network interface to capture information about the IP traffic going to and from a network interface. After you've created a flow log, you can view and retrieve its data in Amazon CloudWatch Logs. For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

IP addresses per network interface per instance type

Each instance type supports a maximum number of network interfaces, maximum number of private IPv4 addresses per network interface, and maximum number of IPv6 addresses per network interface. The limit for IPv6 addresses is separate from the limit for private IPv4 addresses per network interface. Not all instance types support IPv6 addressing.

Available network interfaces

The *Amazon EC2 Instance Types Guide* provides the information about the network interfaces available for each instance type. For more information, see the following:

- [Network specifications – General purpose](#)
- [Network specifications – Compute optimized](#)
- [Network specifications – Memory optimized](#)
- [Network specifications – Storage optimized](#)
- [Network specifications – Accelerated computing](#)
- [Network specifications – High-performance computing](#)
- [Network specifications – Previous generation](#)

To retrieve network interface information using the AWS CLI

You can use the [describe-instance-types](#) AWS CLI command to display information about an instance type, such as its supported network interfaces and IP addresses per interface. The following example displays this information for all C5 instances.

```
aws ec2 describe-instance-types --filters "Name=instance-type,Values=c5.*" --query
"InstanceTypes[].{Type: InstanceType, MaxENI: NetworkInfo.MaximumNetworkInterfaces,
IPv4addr: NetworkInfo.Ipv4AddressesPerInterface}" --output table
```

DescribeInstanceTypes			
IPv4addr	MaxENI	Type	
30	8	c5.4xlarge	
50	15	c5.24xlarge	
15	4	c5.xlarge	
30	8	c5.12xlarge	
10	3	c5.large	
15	4	c5.2xlarge	
50	15	c5.metal	
30	8	c5.9xlarge	
50	15	c5.18xlarge	

Work with network interfaces

You can work with network interfaces using the Amazon EC2 console or the command line.

Contents

- [Create a network interface](#)
- [View details about a network interface](#)
- [Attach a network interface to an instance](#)
- [Detach a network interface from an instance](#)
- [Manage IP addresses](#)
- [Modify network interface attributes](#)
- [Add or edit tags](#)
- [Delete a network interface](#)

Create a network interface

You can create a network interface in a subnet. You can't move the network interface to another subnet after it's created. You must attach a network interface to an instance in the same Availability Zone.

To create a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Choose **Create network interface**.
4. (Optional) For **Description**, enter a descriptive name.
5. For **Subnet**, select a subnet. The options available in the subsequent steps change depending on the type of subnet you select (IPv4-only, IPv6-only, or dual-stack (IPv4 and IPv6)).
6. For **Private IPv4 address**, do one of the following:
 - Choose **Auto-assign** to allow Amazon EC2 to select an IPv4 address from the subnet.
 - Choose **Custom** and enter an IPv4 address that you select from the subnet.
7. (Subnets with IPv6 addresses only) For **IPv6 address**, do one of the following:
 - Choose **None** if you do not want to assign an IPv6 address to the network interface.
 - Choose **Auto-assign** to allow Amazon EC2 to select an IPv6 address from the subnet.
 - Choose **Custom** and enter an IPv6 address that you select from the subnet.
8. (Optional) If you're creating a network interface in a dual-stack or IPv6-only subnet, you have the option to **Assign Primary IPv6 IP**. This assigns a primary IPv6 global unicast address (GUA) to the network interface. Assigning a primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. Choose **Enable** if the instance that this ENI will be attached to relies on its IPv6 address not changing. AWS will automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address. Once you enable an IPv6 GUA address to be a primary IPv6, you cannot disable it. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. If you have multiple IPv6 addresses associated with an ENI attached to your instance and you enable a primary IPv6 address, the first IPv6 GUA address associated with the ENI becomes the primary IPv6 address.
9. (Optional) To create an Elastic Fabric Adapter, choose **Elastic Fabric Adapter, Enable**.
10. (Optional) Under **Advanced settings**, for **Idle connection tracking timeout**, modify the default idle connection timeouts. For more information about these options, see [Idle connection tracking timeout](#).

- **TCP established timeout:** Timeout (in seconds) for idle TCP connections in an established state. Min: 60 seconds. Max: 432000 seconds (5 days). Default: 432000 seconds. Recommended: Less than 432000 seconds.
- **UDP timeout:** Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction. Min: 30 seconds. Max: 60 seconds. Default: 30 seconds.
- **UDP stream timeout:** Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction. Min: 60 seconds. Max: 180 seconds (3 minutes). Default: 180 seconds.

11. For **Security groups**, select one or more security groups.
12. (Optional) For each tag, choose **Add new tag** and enter a tag key and an optional tag value.
13. Choose **Create network interface**.

To create a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [create-network-interface](#) (AWS CLI)
- [New-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

View details about a network interface

You can view all the network interfaces in your account.

To describe a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. To view the details page for a network interface, select the ID of the network interface. Alternatively, to view information without leaving the network interfaces page, select the checkbox for the network interface.

To describe a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [describe-network-interfaces](#) (AWS CLI)
- [Get-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

To describe a network interface attribute using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [describe-network-interface-attribute](#) (AWS CLI)
- [Get-EC2NetworkInterfaceAttribute](#) (AWS Tools for Windows PowerShell)

Attach a network interface to an instance

You can attach a network interface to any instance in the same Availability Zone as the network interface, using either the **Instances** or **Network Interfaces** page of the Amazon EC2 console. Alternatively, you can specify existing network interfaces when you [launch instances](#).

Important

For EC2 instances in an IPv6-only subnet, if you attach a secondary network interface to the instance, the private DNS hostname of the second network interface will resolve to the first IPv6 address on the instance's first network interface. For more information about EC2 instance private DNS hostnames, see [Amazon EC2 instance hostname types](#).

If the public IPv4 address on your instance is released, it does not receive a new one if there is more than one network interface attached to the instance. For more information about the behavior of public IPv4 addresses, see [Public IPv4 addresses](#).

Instances page

To attach a network interface to an instance using the Instances page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Instances**.
3. Select the checkbox for the instance.
4. Choose **Actions, Networking, Attach network interface**.
5. Choose a VPC. If you are attaching a secondary network interface to the instance, the network interface can reside in the same VPC as your instance or in a different VPC that you own (as long as the network interface is in a subnet that is in the same Availability Zone as your instance). This enables you to create multi-homed instances across VPCs with different networking and security configurations.
6. Select a network interface. If the instance supports multiple network cards, you can choose a network card.
7. Choose **Attach**.

Network Interfaces page

To attach a network interface to an instance using the Network Interfaces page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Attach**.
5. Choose an instance. If the instance supports multiple network cards, you can choose a network card.
6. Choose **Attach**.

To attach a network interface to an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

Note

You can attach a network interface that's in another VPC (but in the same Availability Zone) to an instance using the [attach-network-interface](#) AWS CLI command. You cannot do this using the AWS Management Console.

- [attach-network-interface](#) (AWS CLI)
- [Add-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

Detach a network interface from an instance

You can detach a secondary network interface that is attached to an EC2 instance at any time, using either the **Instances** or **Network Interfaces** page of the Amazon EC2 console.

If you try to detach a network interface that is attached to a resource from another service, such as an Elastic Load Balancing load balancer, a Lambda function, a WorkSpace, or a NAT gateway, you get an error that you do not have permission to access the resource. To find which service created the resource attached to a network interface, check the description of the network interface. If you delete the resource, then its network interface is deleted.

Instances page

To detach a network interface from an instance using the Instances page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the checkbox for the instance. Check the **Network interfaces** section of the **Networking** tab to verify that the network interface is attached to an instance as a secondary network interface.
4. Choose **Actions, Networking, Detach network interface**.
5. Select the network interface and choose **Detach**.

Network Interfaces page

To detach a network interface from an instance using the Network Interfaces page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface. Check the **Instance details** section of the **Details** tab to verify that the network interface is attached to an instance as a secondary network interface.
4. Choose **Actions, Detach**.

5. When prompted for confirmation, choose **Detach**.
6. If the network interface fails to detach from the instance, choose **Force detachment**, **Enable** and then try again. We recommend that force detachment only as a last resort. Forcing a detachment can prevent you from attaching a different network interface on the same index until you restart the instance. It can also prevent the instance metadata from reflecting that the network interface was detached until you restart the instance.

To detach a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [detach-network-interface](#) (AWS CLI)
- [Dismount-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

Manage IP addresses

You can manage the following IP addresses for your network interfaces:

- Elastic IP addresses (one per private IPv4 address)
- IPv4 addresses
- IPv6 addresses
- Primary IPv6 address

To manage the Elastic IP addresses of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. To associate an Elastic IP address, do the following:
 - a. Choose **Actions, Associate address**.
 - b. For **Elastic IP address**, select the Elastic IP address.
 - c. For **Private IPv4 address**, select the private IPv4 address to associate with the Elastic IP address.

- d. (Optional) Choose **Allow the Elastic IP address to be reassociated** if the network interface is currently associated with another instance or network interface.
 - e. Choose **Associate**.
5. To disassociate an Elastic IP address, do the following:
- a. Choose **Actions, Disassociate address**.
 - b. For **Public IP address**, select the Elastic IP address.
 - c. Choose **Disassociate**.

To manage the IPv4 and IPv6 addresses of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface.
4. Choose **Actions, Manage IP addresses**.
5. Expand the network interface.
6. For **IPv4 addresses**, modify the IP addresses as needed. To assign an IPv4 address, choose **Assign new IP address** and then specify an IPv4 address from the subnet range or let AWS choose one for you. To unassign an IPv4 address, choose **Unassign** next to the address.
7. For **IPv6 addresses**, modify the IP addresses as needed. To assign an IPv6 address, choose **Assign new IP address** and then specify an IPv6 address from the subnet range or let AWS choose one for you. To unassign an IPv6 address, choose **Unassign** next to the address.
8. (Optional) If your modifying a network interface in a dual-stack or IPv6-only subnet, you have the option to **Assign Primary IPv6 IP**. Assigning a primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. Choose **Enable** if the instance that this ENI will be attached to relies on its IPv6 address not changing. AWS will automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address. Once you enable an IPv6 GUA address to be a primary IPv6, you cannot disable it. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. If you have multiple IPv6 addresses associated with an ENI attached to your instance and you enable a primary IPv6 address, the first IPv6 GUA address associated with the ENI becomes the primary IPv6 address.
9. Choose **Save**.

To manage the IP addresses of a network interface using the AWS CLI

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [assign-ipv6-addresses](#)
- [associate-address](#)
- [disassociate-address](#)
- [unassign-ipv6-addresses](#)

To manage the IP addresses of a network interface using the Tools for Windows PowerShell

You can use one of the following commands.

- [Register-EC2Address](#)
- [Register-EC2Ipv6AddressList](#)
- [Unregister-EC2Address](#)
- [Unregister-EC2Ipv6AddressList](#)

Modify network interface attributes

You can change the following network interface attributes:

- [Description](#)
- [Security groups](#)
- [Delete on termination](#)
- [Source/destination check](#)

To change the description of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change description**.

5. For **Description**, enter a description for the network interface.
6. Choose **Save**.

To change the security groups of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change security groups**.
5. For **Associated security groups**, select the security groups to use, and then choose **Save**.

The security group and network interface must be created for the same VPC. To change the security group for interfaces owned by other services, such as Elastic Load Balancing, do so through that service.

To change the termination behavior of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change termination behavior**.
5. Select or clear **Delete on termination, Enable** as needed, and then choose **Save**.

To change source/destination checking for a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change source/dest check**.
5. Select or clear **Source/destination check, Enable** as needed, and then choose **Save**.

To change idle connection tracking timeouts:

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Modify connection timeout**.
5. Modify the idle connection tracking timeouts. For more information about these options, see [Idle connection tracking timeout](#).
 - **TCP established timeout:** Timeout (in seconds) for idle TCP connections in an established state. Min: 60 seconds. Max: 432000 seconds (5 days). Default: 432000 seconds. Recommended: Less than 432000 seconds.
 - **UDP timeout:** Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction. Min: 30 seconds. Max: 60 seconds. Default: 30 seconds.
 - **UDP stream timeout:** Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction. Min: 60 seconds. Max: 180 seconds (3 minutes). Default: 180 seconds.
6. Choose **Save**.

To modify network interface attributes using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [modify-network-interface-attribute](#) (AWS CLI)
- [Edit-EC2NetworkInterfaceAttribute](#) (AWS Tools for Windows PowerShell)

Add or edit tags

Tags are metadata that you can add to a network interface. Tags are private and are only visible to your account. Each tag consists of a key and an optional value. For more information about tags, see [Tag your Amazon EC2 resources](#).

To add or edit tags for a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. In **Tags** tab, choose **Manage tags**.
5. For each tag to create, choose **Add new tag** and enter a key and optional value. When you're done, choose **Save**.

To add or edit tags for a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [create-tags](#) (AWS CLI)
- [New-EC2Tag](#) (AWS Tools for Windows PowerShell)

Delete a network interface

Deleting a network interface releases all attributes associated with the interface and releases any private IP addresses or Elastic IP addresses to be used by another instance.

You cannot delete a network interface that is in use. First, you must [detach the network interface](#).

To delete a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface, and then choose **Actions, Delete**.
4. When prompted for confirmation, choose **Delete**.

To delete a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [delete-network-interface](#) (AWS CLI)
- [Remove-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

Best practices for configuring network interfaces

- You can attach a network interface to an instance when it's running (hot attach), when it's stopped (warm attach), or when the instance is being launched (cold attach).
- You can detach secondary network interfaces when the instance is running or stopped. However, you can't detach the primary network interface.
- You can move a secondary network interface from one instance to another, if the instances are in the same Availability Zone and VPC but in different subnets.
- When launching an instance using the CLI, API, or an SDK, you can specify the primary network interface and additional network interfaces.
- Launching an Amazon Linux or Windows Server instance with multiple network interfaces automatically configures interfaces, private IPv4 addresses, and route tables on the operating system of the instance.
- A warm or hot attach of an additional network interface might require you to manually bring up the second interface, configure the private IPv4 address, and modify the route table accordingly. Instances running Amazon Linux or Windows Server automatically recognize the warm or hot attach and configure themselves.
- You cannot attach another network interface to an instance (for example, a NIC teaming configuration) to increase or double the network bandwidth to or from the dual-homed instance.
- If you attach two or more network interfaces from the same subnet to an instance, you might encounter networking issues such as asymmetric routing. If possible, use a secondary private IPv4 address on the primary network interface instead. If you need to use multiple network interfaces, you must configure the network interfaces to use static routing.

Scenarios for network interfaces

Attaching multiple network interfaces to an instance is useful when you want to:

- Create a management network.
- Use network and security appliances in your Virtual Private Cloud (VPC).
- Create dual-homed instances with workloads/roles on distinct subnets.
- Create a low-budget, high-availability solution.

Create a management network

This scenario describes how you can create a management network with network interfaces, given the following criteria and settings (image follows).

Criteria

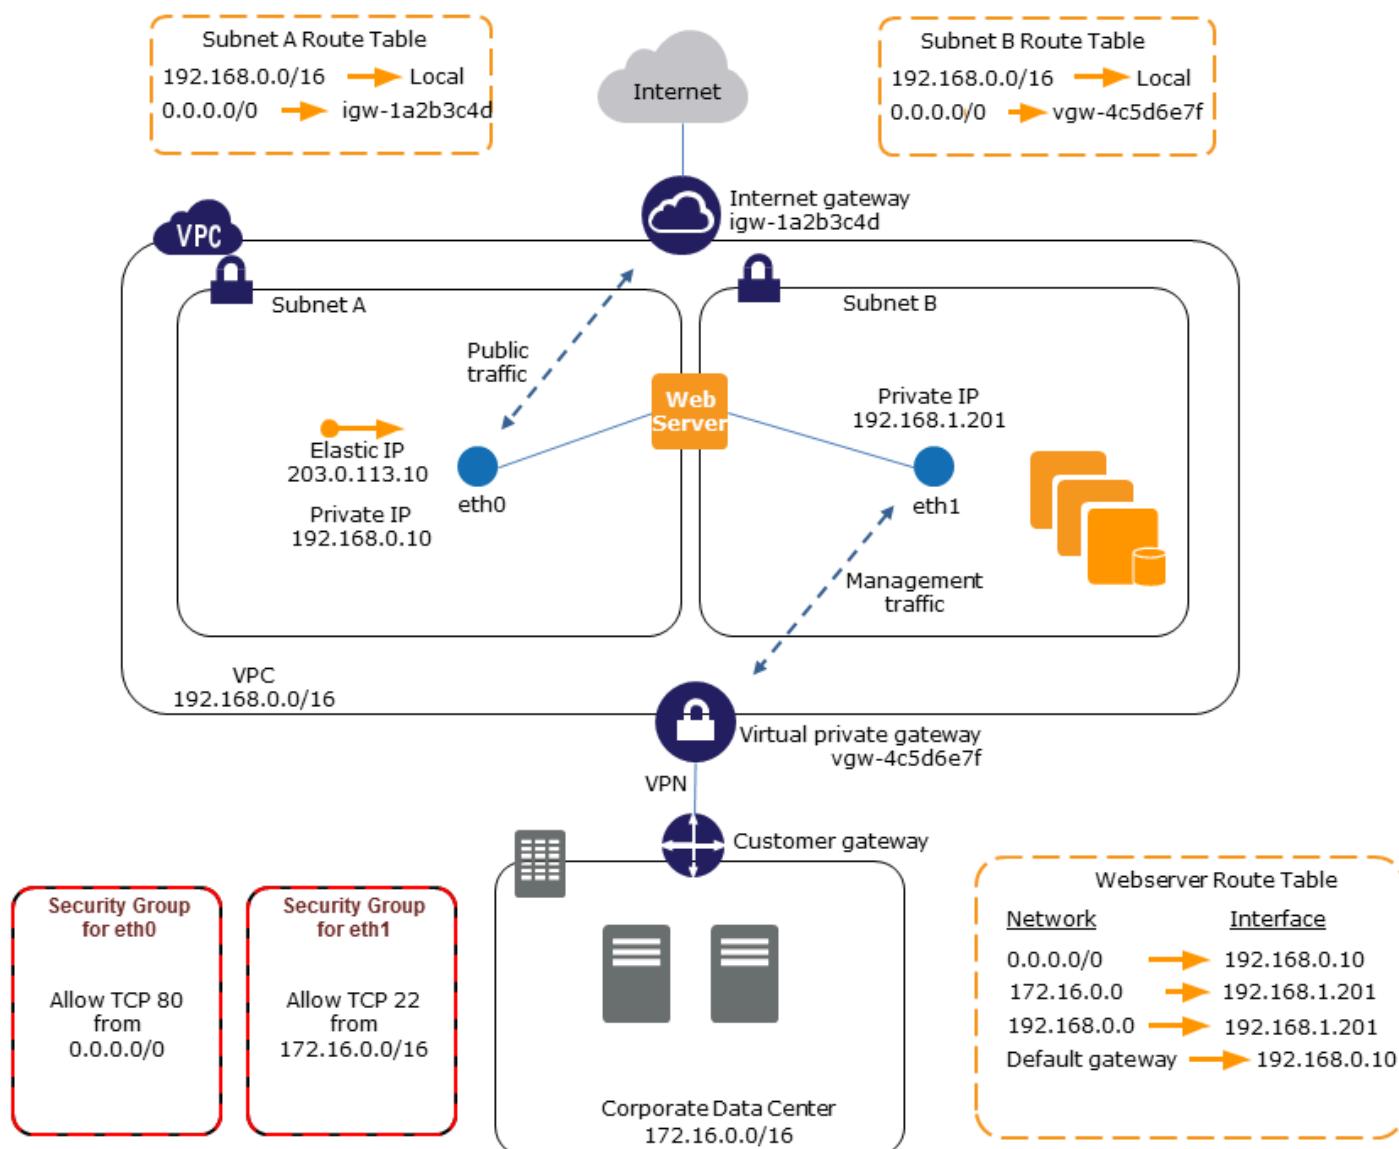

- The primary network interface on the instance (*eth0*) handles public traffic.
- The secondary network interface on the instance (*eth1*) handles backend management traffic. It's connected to a separate subnet that has more restrictive access controls, and is located within the same Availability Zone (AZ) as the primary network interface.

Settings

- The primary network interface, which may or may not be behind a load balancer, has an associated security group that allows access to the server from the internet. For example, allow TCP port 80 and 443 from *0.0.0.0/0* or from the load balancer.
- The secondary network interface has an associated security group that allows RDP access only, initiated from one of the following locations:
 - An allowed range of IP addresses, either within the VPC, or from the internet.
 - A private subnet within the same AZ as the primary network interface.
 - A virtual private gateway.

Note

To ensure failover capabilities, consider using a secondary private IPv4 for incoming traffic on a network interface. In the event of an instance failure, you can move the interface and/or secondary private IPv4 address to a standby instance.

Use network and security appliances in your VPC

Some network and security appliances, such as load balancers, network address translation (NAT) servers, and proxy servers prefer to be configured with multiple network interfaces. You can create and attach secondary network interfaces to instances that are running these types of applications and configure the additional interfaces with their own public and private IP addresses, security groups, and source/destination checking.

Creating dual-homed instances with workloads/roles on distinct subnets

You can place a network interface on each of your web servers that connects to a mid-tier network where an application server resides. The application server can also be dual-homed to a backend network (subnet) where the database server resides. Instead of routing network packets through the dual-homed instances, each dual-homed instance receives and processes requests on the front end, initiates a connection to the backend, and then sends requests to the servers on the backend network.

Creating dual-homed instances with workloads/roles on distinct VPCs within the same account

You can launch an EC2 instance in one VPC and attach a secondary ENI from another VPC (but in the same Availability Zone) to the instance. This enables you to create multi-homed instances across VPCs with different networking and security configurations. You cannot create multi-homed instances across VPCs across different AWS accounts.

You can use dual-homed instances across VPCs in the following use cases:

- **Overcome CIDR overlaps between two VPCs that can't be peered together:** You can leverage a secondary CIDR in a VPC and allow an instance to communicate across two non-overlapping IP ranges.
- **Connect multiple VPCs within a single account:** Enable communication between individual resources that would normally be separated by VPC boundaries.

Create a low budget high availability solution

If one of your instances serving a particular function fails, its network interface can be attached to a replacement or hot standby instance pre-configured for the same role in order to rapidly recover the service. For example, you can use a network interface as your primary or secondary network interface to a critical service such as a database instance or a NAT instance. If the instance fails, you (or more likely, the code running on your behalf) can attach the network interface to a hot standby instance. Because the interface maintains its private IP addresses, Elastic IP addresses, and MAC address, network traffic begins flowing to the standby instance as soon as you attach the network interface to the replacement instance. Users experience a brief loss of connectivity between the time the instance fails and the time that the network interface is attached to the standby instance, but no changes to the route table or your DNS server are required.

Requester-managed network interfaces

A requester-managed network interface is a network interface that an AWS service creates in your VPC on your behalf. The network interface is associated with a resource for another service, such as a DB instance from Amazon RDS, a NAT gateway, or an interface VPC endpoint from AWS PrivateLink.

Considerations

- You can view the requester-managed network interfaces in your account. You can add or remove tags, but you can't change other properties of a requester-managed network interface.
- You can't detach a requester-managed network interface.
- When you delete the resource associated with a requester-managed network interface, the AWS service detaches the network interface and deletes it. If the service detached a network interface but didn't delete it, you can delete the detached network interface.

To view requester-managed network interfaces using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network & Security**, **Network Interfaces**.
3. Select the ID of the network interface to open its details page.
4. The following are the key fields that you can use to determine the purpose of the network interface:
 - **Description:** A description provided by the AWS service that created the interface. For example, "VPC Endpoint Interface vpce 089f2123488812123".
 - **Requester-managed:** Indicates whether the network interface is managed by AWS.
 - **Requester ID:** The alias or AWS account ID of the principal or service that created the network interface. If you created the network interface, this is your AWS account ID. Otherwise, another principal or service created it.

To view requester-managed network interfaces using the AWS CLI

Use the [describe-network-interfaces](#) command as follows.

```
aws ec2 describe-network-interfaces --filters Name=requester-managed,Values=true
```

The following is example output that shows the key fields that you can use to determine the purpose of the network interface: `Description` and `InterfaceType`.

```
{  
    ...  
    "Description": "VPC Endpoint Interface vpce-089f2123488812123",  
    ...  
    "InterfaceType": "vpc_endpoint",  
    ...  
    "NetworkInterfaceId": "eni-0d11e3ccd2c0e6c57",  
    ...  
    "RequesterId": "727180483921",  
    "RequesterManaged": true,  
    ...  
}
```

To view requester-managed network interfaces using the Tools for Windows PowerShell

Use the [Get-EC2NetworkInterface](#) cmdlet as follows.

```
Get-EC2NetworkInterface -Filter @{ Name="requester-managed"; Values="true" }
```

The following is example output that shows the key fields that you can use to determine the purpose of the network interface: `Description` and `InterfaceType`.

```
Description      : VPC Endpoint Interface vpce-089f2123488812123  
...  
InterfaceType   : vpc_endpoint  
...  
NetworkInterfaceId : eni-0d11e3ccd2c0e6c57  
...  
RequesterId     : 727180483921  
RequesterManaged : True  
...
```

Assign prefixes to Amazon EC2 network interfaces

You can assign a private IPv4 or IPv6 CIDR range, either automatically or manually, to your network interfaces. By assigning prefixes, you scale and simplify the management of applications, including container and networking applications that require multiple IP addresses on an instance. For more information about IPv4 and IPv6 addresses, see [Amazon EC2 instance IP addressing](#).

The following assignment options are available:

- **Automatic assignment** — AWS chooses the prefix from your VPC subnet's IPv4 or IPv6 CIDR block and assigns it to your network interface.
- **Manual Assignment** — You specify the prefix from your VPC subnet's IPv4 or IPv6 CIDR block, and AWS verifies that the prefix is not already assigned to other resources before assigning it to your network interface.

Assigning prefixes has the following benefits:

- Increased IP addresses on a network interface — When you use a prefix, you assign a block of IP addresses as opposed to individual IP addresses. This increases the number of IP addresses for a network interface.
- Simplified VPC management for containers — In container applications, each container requires a unique IP address. Assigning prefixes to your instance simplifies the management of your VPCs, as you can launch and terminate containers without having to call Amazon EC2 APIs for individual IP assignments.

Contents

- [Basics for assigning prefixes](#)
- [Considerations and limits for prefixes](#)
- [Work with prefixes](#)

Basics for assigning prefixes

- You can assign a prefix to new or existing network interfaces.
- To use prefixes, you assign a prefix to your network interface, attach the network interface to your instance, and then configure your operating system.
- When you choose the option to specify a prefix, the prefix must meet the following requirements:
 - The IPv4 prefix that you can specify is /28.
 - The IPv6 prefix that you can specify is /80.
 - The prefix is in the subnet CIDR of the network interface, and does not overlap with other prefixes or IP addresses assigned to existing resources in the subnet.

- You can assign a prefix to the primary or secondary network interface.
- You can assign an Elastic IP address to a network interface that has a prefix assigned to it.
- You can also assign an Elastic IP address to the IP address part of the assigned prefix.
- We resolve the private DNS host name of an instance to the primary private IPv4 address.
- We assign each private IPv4 address for a network interface, including those from prefixes, using the following format:
 - us-east-1 Region

ip-private-ipv4-address.ec2.internal

- All other Regions

ip-private-ipv4-address.region.compute.internal

Considerations and limits for prefixes

Take the following into consideration when you use prefixes:

- Network interfaces with prefixes are supported with [instances built on the AWS Nitro System](#).
- Prefixes for network interfaces are limited to IPv6 addresses and private IPv4 addresses.
- The maximum number of IP addresses that you can assign to a network interface depends on the instance type. Each prefix that you assign to a network interface counts as one IP address. For example, a c5.large instance has a limit of 10 IPv4 addresses per network interface. Each network interface for this instance has a primary IPv4 address. If a network interface has no secondary IPv4 addresses, you can assign up to 9 prefixes to the network interface. For each additional IPv4 address that you assign to a network interface, you can assign one less prefix to the network interface. For more information, see [IP addresses per network interface per instance type](#).
- Prefixes are included in source/destination checks.

Work with prefixes

You can use prefixes with your network interfaces as follows.

Tasks

- [Assign prefixes during network interface creation](#)
- [Assign prefixes to existing network interfaces](#)
- [Configure your operating system for network interfaces with prefixes](#)
- [View the prefixes assigned to your network interfaces](#)
- [Remove prefixes from your network interfaces](#)

Assign prefixes during network interface creation

If you use the automatic assignment option, you can reserve a block of IP addresses in your subnet. AWS chooses the prefixes from this block. For more information, see [Subnet CIDR reservations](#) in the *Amazon VPC User Guide*.

After you have created the network interface, use the [attach-network-interface](#) AWS CLI command to attach the network interface to your instance. You must configure your operating system to work with network interfaces with prefixes. For more information, see [Configure your operating system for network interfaces with prefixes](#).

Tasks

- [Assign automatic prefixes during network interface creation](#)
- [Assign specific prefixes during network interface creation](#)

Assign automatic prefixes during network interface creation

You can assign automatic prefixes during network interface creation using one of the following methods.

Console

To assign automatic prefixes during network interface creation

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces** and then choose **Create network interface**.
3. Specify a description for the network interface, select the subnet in which to create the network interface, and configure the private IPv4 and IPv6 addresses.
4. Expand **Advanced settings** and do the following:

- a. To automatically assign an IPv4 prefix, for **IPv4 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv4 prefixes**, specify the number of prefixes to assign.
- b. To automatically assign an IPv6 prefix, for **IPv6 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv6 prefixes**, specify the number of prefixes to assign.

 **Note**

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

5. Select the security groups to associate with the network interface and assign resource tags if needed.
6. Choose **Create network interface**.

AWS CLI

To assign automatic IPv4 prefixes during network interface creation

Use the [create-network-interface](#) command and set `--ipv4-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 prefix.

```
C:\> aws ec2 create-network-interface \
--subnet-id subnet-047cfed18eEXAMPLE \
--description "IPv4 automatic example" \
--ipv4-prefix-count 1
```

Example output

```
{  
    "NetworkInterface": {  
        "AvailabilityZone": "us-west-2a",  
        "Description": "IPv4 automatic example",  
        "Groups": [  
            {  
                "GroupName": "default",  
                "GroupId": "sg-044c2de2c4EXAMPLE"  
            }  
        ],  
        "InterfaceType": "interface",  
        "Ipv6Addresses": []  
    }  
}
```

```
"MacAddress": "02:98:65:dd:18:47",
"NetworkInterfaceId": "eni-02b80b4668EXAMPLE",
"OwnerId": "123456789012",

}
}
```

To assign automatic IPv6 prefixes during network interface creation

Use the [create-network-interface](#) command and set `--ipv6-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 prefix.

```
C:\> aws ec2 create-network-interface \
--subnet-id subnet-047cfed18eEXAMPLE \
--description "IPv6 automatic example" \
--ipv6-prefix-count 1
```

Example output

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "IPv6 automatic example",
        "Groups": [
```

```
{  
    "GroupName": "default",  
    "GroupId": "sg-044c2de2c4EXAMPLE"  
}  
,  
"InterfaceType": "interface",  
"Ipv6Addresses": [],  
"MacAddress": "02:bb:e4:31:fe:09",  
"NetworkInterfaceId": "eni-006edbcfa4EXAMPLE",  
"OwnerId": "123456789012",  
"PrivateIpAddress": "10.0.0.73",  
"PrivateIpAddresses": [  
    {  
        "Primary": true,  
        "PrivateIpAddress": "10.0.0.73"  
    }  
,  
    "Ipv6Prefixes": [  
        {  
            "Ipv6Prefix": "2600:1f13:fc2:a700:1768::/80"  
        }  
,  
        "RequesterId": "AIDAI5AJI5LXF5XXDPC0",  
        "RequesterManaged": false,  
        "SourceDestCheck": true,  
        "Status": "pending",  
        "SubnetId": "subnet-047cfed18eEXAMPLE",  
        "TagSet": [],  
        "VpcId": "vpc-0e12f52b21EXAMPLE"  
    }  
]
```

Assign specific prefixes during network interface creation

You can assign specific prefixes during network interface creation using one of the following methods.

Console

To assign specific prefixes during network interface creation

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Network Interfaces** and then choose **Create network interface**.
3. Specify a description for the network interface, select the subnet in which to create the network interface, and configure the private IPv4 and IPv6 addresses.
4. Expand **Advanced settings** and do the following:
 - a. To assign a specific IPv4 prefix, for **IPv4 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.
 - b. To assign a specific IPv6 prefix, for **IPv6 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.

 **Note**

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

5. Select the security groups to associate with the network interface and assign resource tags if needed.
6. Choose **Create network interface**.

AWS CLI

To assign specific IPv4 prefixes during network interface creation

Use the [create-network-interface](#) command and set `--ipv4-prefixes` to the prefixes.

AWS selects IP addresses from this range. In the following example, the prefix CIDR is `10.0.0.208/28`.

```
C:\> aws ec2 create-network-interface \
    --subnet-id subnet-047cfed18eEXAMPLE \
    --description "IPv4 manual example" \
    --ipv4-prefixes Ipv4Prefix=10.0.0.208/28
```

Example output

```
{  
    "NetworkInterface": {  
        "AvailabilityZone": "us-west-2a",  
        "Description": "IPv4 manual example",  
        "Ipv4Prefix": "10.0.0.208/28",  
        "SubnetId": "subnet-047cfed18eEXAMPLE",  
        "Status": "available",  
        "Type": "Primary",  
        "MacAddress": "0A:1B:2C:3D:4E:5F",  
        "PrivateIpAddress": "10.0.0.208",  
        "PrivateIpAddresses": [  
            {"PrivateIpAddress": "10.0.0.208"}]  
    }  
}
```

```
"Groups": [
    {
        "GroupName": "default",
        "GroupId": "sg-044c2de2c4EXAMPLE"
    }
],
"InterfaceType": "interface",
"Ipv6Addresses": [],
"MacAddress": "02:98:65:dd:18:47",
"NetworkInterfaceId": "eni-02b80b4668EXAMPLE",
"OwnerId": "123456789012",
"PrivateIpAddress": "10.0.0.62",
"PrivateIpAddresses": [
    {
        "Primary": true,
        "PrivateIpAddress": "10.0.0.62"
    }
],
"Ipv4Prefixes": [
    {
        "Ipv4Prefix": "10.0.0.208/28"
    }
],
"RequesterId": "AIDAI5AJI5LXF5XXDPC0",
"RequesterManaged": false,
"SourceDestCheck": true,
"Status": "pending",
"SubnetId": "subnet-047cfed18eEXAMPLE",
"TagSet": [],
"VpcId": "vpc-0e12f52b21EXAMPLE"
}
}
```

To assign specific IPv6 prefixes during network interface creation

Use the [create-network-interface](#) command and set --ipv6-prefixes to the prefixes. AWS selects IP addresses from this range. In the following example, the prefix CIDR is 2600:1f13:fc2:a700:1768::/80.

```
C:\> aws ec2 create-network-interface \
--subnet-id subnet-047cfed18eEXAMPLE \
--description "IPv6 manual example" \
```

```
--ipv6-prefixes Ipv6Prefix=2600:1f13:fc2:a700:1768::/80
```

Example output

```
{  
    "NetworkInterface": {  
        "AvailabilityZone": "us-west-2a",  
        "Description": "IPv6 automatic example",  
        "Groups": [  
            {  
                "GroupName": "default",  
                "GroupId": "sg-044c2de2c4EXAMPLE"  
            }  
        ],  
        "InterfaceType": "interface",  
        "Ipv6Addresses": [],  
        "MacAddress": "02:bb:e4:31:fe:09",  
        "NetworkInterfaceId": "eni-006edbcfa4EXAMPLE",  
        "OwnerId": "123456789012",  
        "PrivateIpAddress": "10.0.0.73",  
        "PrivateIpAddresses": [  
            {  
                "Primary": true,  
                "PrivateIpAddress": "10.0.0.73"  
            }  
        ],  
        "Ipv6Prefixes": [  
            {  
                "Ipv6Prefix": "2600:1f13:fc2:a700:1768::/80"  
            }  
        ],  
        "RequesterId": "AIDAI5AJI5LXF5XXDPC0",  
        "RequesterManaged": false,  
        "SourceDestCheck": true,  
        "Status": "pending",  
        "SubnetId": "subnet-047cfed18eEXAMPLE",  
        "TagSet": [],  
        "VpcId": "vpc-0e12f52b21EXAMPLE"  
    }  
}
```

Assign prefixes to existing network interfaces

After you have assigned the prefixes, use the [attach-network-interface](#) AWS CLI command to attach the network interface to your instance. You must configure your operating system to work with network interfaces with prefixes. For more information, see [Configure your operating system for network interfaces with prefixes](#).

Tasks

- [Assign automatic prefixes to an existing network interface](#)
- [Assign specific prefixes to an existing network interface](#)

Assign automatic prefixes to an existing network interface

You can assign automatic prefixes to an existing network interface using one of the following methods.

Console

To assign automatic prefixes to an existing network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface to which to assign the prefixes, and choose **Actions, Manage prefixes**.
4. To automatically assign an IPv4 prefix, for **IPv4 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv4 prefixes**, specify the number of prefixes to assign.
5. To automatically assign an IPv6 prefix, for **IPv6 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv6 prefixes**, specify the number of prefixes to assign.

 **Note**

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

6. Choose **Save**.

AWS CLI

You can use the [assign-ipv6-addresses](#) command to assign IPv6 prefixes and the [assign-private-ip-addresses](#) command to assign IPv4 prefixes to existing network interfaces.

To assign automatic IPv4 prefixes to an existing network interface

Use the [assign-private-ip-addresses](#) command and set `--ipv4-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 IPv4 prefix.

```
C:\> aws ec2 assign-private-ip-addresses \
--network-interface-id eni-081fbb4095EXAMPLE \
--ipv4-prefix-count 1
```

Example output

```
{  
    "NetworkInterfaceId": "eni-081fbb4095EXAMPLE",  
    "AssignedIpv4Prefixes": [  
        {  
            "Ipv4Prefix": "10.0.0.176/28"  
        }  
    ]  
}
```

To assign automatic IPv6 prefixes to an existing network interface

Use the [assign-ipv6-addresses](#) command and set `--ipv6-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 IPv6 prefix.

```
C:\> aws ec2 assign-ipv6-addresses \
--network-interface-id eni-00d577338cEXAMPLE \
--ipv6-prefix-count 1
```

Example output

```
{  
    "AssignedIpv6Prefixes": [  
        "2600:1f13:fc2:a700:18bb::/80"  
    ],  
    "NetworkInterfaceId": "eni-00d577338cEXAMPLE"  
}
```

Assign specific prefixes to an existing network interface

You can assign specific prefixes to an existing network interface using one of the following methods.

Console

To assign specific prefixes to an existing network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface to which to assign the prefixes, and choose **Actions, Manage prefixes**.
4. To assign a specific IPv4 prefix, for **IPv4 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.
5. To assign a specific IPv6 prefix, for **IPv6 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.

 **Note**

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

6. Choose **Save**.

AWS CLI

Assign specific IPv4 prefixes to an existing network interface

Use the [assign-private-ip-addresses](#) command and set `--ipv4-prefixes` to the prefix. AWS selects IPv4 addresses from this range. In the following example, the prefix CIDR is `10.0.0.208/28`.

```
C:\> aws ec2 assign-private-ip-addresses \
--network-interface-id eni-081fbb4095EXAMPLE \
--ipv4-prefixes 10.0.0.208/28
```

Example output

```
{
```

```
"NetworkInterfaceId": "eni-081fbb4095EXAMPLE",
"AssignedIpv4Prefixes": [
    {
        "Ipv4Prefix": "10.0.0.208/28"
    }
]
```

Assign specific IPv6 prefixes to an existing network interface

Use the [assign-ipv6-addresses](#) command and set `--ipv6-prefixes` to the prefix. AWS selects IPv6 addresses from this range. In the following example, the prefix CIDR is `2600:1f13:fc2:a700:18bb::/80`.

```
C:\> aws ec2 assign-ipv6-addresses \
--network-interface-id eni-00d577338cEXAMPLE \
--ipv6-prefixes 2600:1f13:fc2:a700:18bb::/80
```

Example output

```
{
    "NetworkInterfaceId": "eni-00d577338cEXAMPLE",
    "AssignedIpv6Prefixes": [
        {
            "Ipv6Prefix": "2600:1f13:fc2:a700:18bb::/80"
        }
    ]
}
```

Configure your operating system for network interfaces with prefixes

Amazon Linux AMIs might contain additional scripts installed by AWS, known as `ec2-net-utils`. These scripts optionally automate the configuration of your network interfaces. They are available for Amazon Linux only.

If you are not using Amazon Linux, you can use a Container Network Interface (CNI) for Kubernetes plug-in, or `dockerd` if you use Docker to manage your containers.

View the prefixes assigned to your network interfaces

You can view the prefixes assigned to your network interfaces using one of the following methods.

Console

To view the automatic prefixes assigned to an existing network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface for which to view the prefixes and choose the **Details** tab.
4. The **IPv4 Prefix Delegation** field lists the assigned IPv4 prefixes, and the **IPv6 Prefix Delegation** field lists the assigned IPv6 prefixes.

AWS CLI

You can use the [describe-network-interfaces](#) AWS CLI command to view the prefixes assigned to your network interfaces.

```
C:\> aws ec2 describe-network-interfaces
```

Example output

```
{  
    "NetworkInterfaces": [  
        {  
            "AvailabilityZone": "us-west-2a",  
            "Description": "IPv4 automatic example",  
            "Groups": [  
                {  
                    "GroupName": "default",  
                    "GroupId": "sg-044c2de2c4EXAMPLE"  
                }  
            ],  
            "InterfaceType": "interface",  
            "Ipv6Addresses": [],  
            "MacAddress": "02:98:65:dd:18:47",  
            "NetworkInterfaceId": "eni-02b80b4668EXAMPLE",  
            "OwnerId": "123456789012",  
            "PrivateIpAddress": "10.0.0.62",  
            "PrivateIpAddresses": [  
                {  
                    "Primary": true,  
                    "PrivateIpAddress": "10.0.0.62"  
                }  
            ]  
        }  
    ]  
}
```

```
        ],
        "Ipv4Prefixes": [
            {
                "Ipv4Prefix": "10.0.0.208/28"
            }
        ],
        "Ipv6Prefixes": [],
        "RequesterId": "AIDAI5AJI5LXF5XXDPC0",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "available",
        "SubnetId": "subnet-05eef9fb78EXAMPLE",
        "TagSet": [],
        "VpcId": "vpc-0e12f52b2146bf252"
    },
    {
        "AvailabilityZone": "us-west-2a",
        "Description": "IPv6 automatic example",
        "Groups": [
            {
                "GroupName": "default",
                "GroupId": "sg-044c2de2c411c91b5"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [],
        "MacAddress": "02:bb:e4:31:fe:09",
        "NetworkInterfaceId": "eni-006edbcfa4EXAMPLE",
        "OwnerId": "123456789012",
        "PrivateIpAddress": "10.0.0.73",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateIpAddress": "10.0.0.73"
            }
        ],
        "Ipv4Prefixes": [],
        "Ipv6Prefixes": [
            {
                "Ipv6Prefix": "2600:1f13:fc2:a700:1768::/80"
            }
        ],
        "RequesterId": "AIDAI5AJI5LXF5XXDPC0",
        "RequesterManaged": false,
```

```
        "SourceDestCheck": true,  
        "Status": "available",  
        "SubnetId": "subnet-05eef9fb78EXAMPLE",  
        "TagSet": [],  
        "VpcId": "vpc-0e12f52b21EXAMPLE"  
    }  
]  
}
```

Remove prefixes from your network interfaces

You can remove prefixes from your network interfaces using one of the following methods.

Console

To remove the prefixes from a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface from which to remove the prefixes and choose **Actions**, **Manage prefixes**.
4. Do one of the following:
 - To remove all assigned prefixes, for **IPv4 prefix delegation** and **IPv6 prefix delegation**, choose **Do not assign**.
 - To remove specific assigned prefixes, for **IPv4 prefix delegation** or **IPv6 prefix delegation**, choose **Custom** and then choose **Unassign** next to the prefixes to remove.

 **Note**

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

5. Choose **Save**.

AWS CLI

You can use the [unassign-ipv6-addresses](#) command to remove IPv6 prefixes and the [unassign-private-ip-addresses](#) commands to remove IPv4 prefixes from your existing network interfaces.

To remove IPv4 prefixes from a network interface

Use the [unassign-private-ip-addresses](#) command and set --ipv4-prefix to the address that you want to remove.

```
C:\> aws ec2 unassign-private-ip-addresses \
--network-interface-id eni-081fb4095EXAMPLE \
--ipv4-prefixes 10.0.0.176/28
```

To remove IPv6 prefixes from a network interface

Use the [unassign-ipv6-addresses](#) command and set --ipv6-prefix to the address that you want to remove.

```
C:\> aws ec2 unassign-ipv6-addresses \
--network-interface-id eni-00d577338cEXAMPLE \
--ipv6-prefix 2600:1f13:fc2:a700:18bb::/80
```

Amazon EC2 instance network bandwidth

Instance bandwidth specifications apply to both inbound and outbound traffic for the instance. For example, if an instance specifies up to 10 Gbps of bandwidth, that means it has up to 10 Gbps of bandwidth for inbound traffic, and up to 10 Gbps for outbound traffic. The network bandwidth that's available to an EC2 instance depends on several factors, as follows.

Multi-flow traffic

Bandwidth for aggregate multi-flow traffic available to an instance depends on the destination of the traffic.

- Within the Region – Traffic can utilize the full network bandwidth available to the instance.
- To other Regions, an internet gateway, Direct Connect, or local gateways (LGW) – Traffic can utilize up to 50% of the network bandwidth available to a current generation instance with a minimum of 32 vCPUs. Bandwidth for a current generation instance with less than 32 vCPUs is limited to 5 Gbps.

Single-flow traffic

Baseline bandwidth for single-flow traffic is limited to 5 Gbps when instances are not in the same [cluster placement group](#). To reduce latency and increase single-flow bandwidth, try one of the following:

- Use a cluster placement group to achieve up to 10 Gbps bandwidth for instances within the same placement group.
- Set up multiple paths between two endpoints to achieve higher bandwidth with Multipath TCP (MPTCP).
- Configure ENA Express for eligible instances within the same subnet to achieve up to 25 Gbps between those instances.

Available instance bandwidth

The available network bandwidth of an instance depends on the number of vCPUs that it has. For example, an m5.8xlarge instance has 32 vCPUs and 10 Gbps network bandwidth, and an m5.16xlarge instance has 64 vCPUs and 20 Gbps network bandwidth. However, instances might not achieve this bandwidth; for example, if they exceed network allowances at the instance level, such as packet per second or number of tracked connections. How much of the available bandwidth the traffic can utilize depends on the number of vCPUs and the destination. For example, an m5.16xlarge instance has 64 vCPUs, so traffic to another instance in the Region can utilize the full bandwidth available (20 Gbps). However, traffic to another instance in a different Region can utilize only 50% of the bandwidth available (10 Gbps).

Typically, instances with 16 vCPUs or fewer (size 4xlarge and smaller) are documented as having "up to" a specified bandwidth; for example, "up to 10 Gbps". These instances have a baseline bandwidth. To meet additional demand, they can use a network I/O credit mechanism to burst beyond their baseline bandwidth. Instances can use burst bandwidth for a limited time, typically from 5 to 60 minutes, depending on the instance size.

An instance receives the maximum number of network I/O credits at launch. If the instance exhausts its network I/O credits, it returns to its baseline bandwidth. A running instance earns network I/O credits whenever it uses less network bandwidth than its baseline bandwidth. A stopped instance does not earn network I/O credits. Instance burst is on a best effort basis, even when the instance has credits available, as burst bandwidth is a shared resource.

There are separate network I/O credit buckets for inbound and outbound traffic.

Base and burst network performance

The *Amazon EC2 Instance Types Guide* describes the network performance for each instance type, plus the baseline network bandwidth available for instances that can use burst bandwidth. For more information, see the following:

- [Network specifications – General purpose](#)
- [Network specifications – Compute optimized](#)
- [Network specifications – Memory optimized](#)
- [Network specifications – Storage optimized](#)
- [Network specifications – Accelerated computing](#)
- [Network specifications – High-performance computing](#)
- [Network specifications – Previous generation](#)

To view network performance using the AWS CLI

You can use the [describe-instance-types](#) AWS CLI command to display information about an instance type. The following example displays network performance information for all C5 instances.

```
aws ec2 describe-instance-types --filters "Name=instance-type,Values=c5.*"
--query "InstanceTypes[].[InstanceType, NetworkInfo.NetworkPerformance,
NetworkInfo.NetworkCards[0].BaselineBandwidthInGbps]" --output table
-----
|           DescribeInstanceTypes           |
+-----+-----+-----+
| c5.4xlarge | Up to 10 Gigabit | 5.0 |
| c5.xlarge   | Up to 10 Gigabit | 1.25 |
| c5.12xlarge | 12 Gigabit      | 12.0 |
| c5.24xlarge | 25 Gigabit      | 25.0 |
| c5.metal    | 25 Gigabit      | 25.0 |
| c5.9xlarge  | 12 Gigabit      | 12.0 |
| c5.2xlarge  | Up to 10 Gigabit | 2.5  |
| c5.large    | Up to 10 Gigabit | 0.75 |
| c5.18xlarge | 25 Gigabit      | 25.0 |
+-----+-----+-----+
```

Monitor instance bandwidth

You can use CloudWatch metrics to monitor instance network bandwidth and the packets sent and received. You can use the network performance metrics provided by the Elastic Network Adapter (ENA) driver to monitor when traffic exceeds the network allowances that Amazon EC2 defines at the instance level.

You can configure whether Amazon EC2 sends metric data for the instance to CloudWatch using one-minute periods or five-minute periods. It is possible that the network performance metrics would show that an allowance was exceeded and packets were dropped while the CloudWatch instance metrics do not. This can happen when the instance has a short spike in demand for network resources (known as a microburst), but the CloudWatch metrics are not granular enough to reflect these microsecond spikes.

Enhanced networking on Windows

Enhanced networking uses single root I/O virtualization (SR-IOV) to provide high-performance networking capabilities on [supported instance types](#). SR-IOV is a method of device virtualization that provides higher I/O performance and lower CPU utilization when compared to traditional virtualized network interfaces. Enhanced networking provides higher bandwidth, higher packet per second (PPS) performance, and consistently lower inter-instance latencies. There is no additional charge for using enhanced networking.

For information about the supported network speed for each instance type, see [Amazon EC2 Instance Types](#).

Contents

Enhanced networking support

All current generation instance types support enhanced networking, except for T2 instances.

You can enable enhanced networking using one of the following mechanisms:

Elastic Network Adapter (ENA)

The Elastic Network Adapter (ENA) supports network speeds of up to 100 Gbps for supported instance types.

All [instances built on the AWS Nitro System](#) use ENA for enhanced networking. In addition, the following Xen instance types support ENA: H1, G3, m4.16xlarge, P2, P3, P3dn, and R4.

Intel 82599 Virtual Function (VF) interface

The Intel 82599 Virtual Function interface supports network speeds of up to 10 Gbps for supported instance types.

The following instance types use the Intel 82599 VF interface for enhanced networking: C3, C4, D2, I2, M4 (excluding m4.16xlarge), and R3.

Enable enhanced networking on your instance

If your instance type supports the Elastic Network Adapter for enhanced networking, follow the procedures in [Enable enhanced networking with the Elastic Network Adapter \(ENA\) on Windows instances](#).

If your instance type supports the Intel 82599 VF interface for enhanced networking, follow the procedures in [Enable enhanced networking with the Intel 82599 VF interface on Windows instances](#).

Enable enhanced networking with the Elastic Network Adapter (ENA) on Windows instances

Amazon EC2 provides enhanced networking capabilities through the Elastic Network Adapter (ENA). To use enhanced networking, you must install the required ENA module and enable ENA support.

Contents

- [Requirements](#)
- [Enhanced networking performance](#)
- [Test whether enhanced networking is enabled](#)
- [Enable enhanced networking on Windows](#)
- [Install or upgrade Elastic Network Adapter \(ENA\) driver](#)
- [Amazon ENA driver versions](#)
- [Subscribe to notifications](#)

Requirements

To prepare for enhanced networking using the ENA, set up your instance as follows:

- Launch an [instance built on the AWS Nitro System](#).
- If the instance is running Windows Server 2008 R2 SP1, ensure that it has the [SHA-2 code signing support update](#).
- Ensure that the instance has internet connectivity.
- Use [AWS CloudShell](#) from the AWS Management Console, or install and configure the [AWS CLI](#) or the [AWS Tools for Windows PowerShell](#) on any computer you choose, preferably your local desktop or laptop. For more information, see [Access Amazon EC2](#) or the [AWS CloudShell User Guide](#). Enhanced networking cannot be managed from the Amazon EC2 console.
- If you have important data on the instance that you want to preserve, you should back that data up now by creating an AMI from your instance. Updating kernels and kernel modules, as well as enabling the enaSupport attribute, might render incompatible instances or operating systems unreachable. If you have a recent backup, your data will still be retained if this happens.

Enhanced networking performance

The following documentation provides a summary of the network performance for the instance types that support ENA enhanced networking:

- [Network specifications for accelerated computing instances](#)
- [Network specifications for compute optimized instances](#)
- [Network specifications for general purpose instances](#)
- [Network specifications for high-performance computing instances](#)
- [Network specifications for memory optimized instances](#)
- [Network specifications for storage optimized instances](#)

Test whether enhanced networking is enabled

To test whether enhanced networking is already enabled, verify that the driver is installed on your instance and that the enaSupport attribute is set.

Instance attribute (enaSupport)

To check whether an instance has the enhanced networking enaSupport attribute set, use one of the following commands. If the attribute is set, the response is true.

- [describe-instances](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-instances --instance-ids instance_id --query  
"Reservations[] .Instances[] .EnaSupport"
```

- [Get-EC2Instance](#) (Tools for Windows PowerShell)

```
(Get-EC2Instance -InstanceId instance-id).Instances .EnaSupport
```

Image attribute (enaSupport)

To check whether an AMI has the enhanced networking enaSupport attribute set, use one of the following commands. If the attribute is set, the response is true.

- [describe-images](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-images --image-id ami_id --query "Images[].EnaSupport"
```

- [Get-EC2Image \(Tools for Windows PowerShell\)](#)

```
(Get-EC2Image -ImageId ami_id).EnaSupport
```

Enable enhanced networking on Windows

If you launched your instance and it does not have enhanced networking enabled already, you must download and install the required network adapter driver on your instance, and then set the enaSupport instance attribute to activate enhanced networking. You can only enable this attribute on supported instance types and only if the ENA driver is installed. For more information, see [Enhanced networking support](#).

To enable enhanced networking

1. Connect to your instance and log in as the local administrator.
2. [Windows Server 2016 and 2019 only] Run the following EC2Launch PowerShell script to configure the instance after the driver is installed.

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -Schedule
```

3. From the instance, install the driver as follows:
 - a. [Download](#) the latest driver to the instance.
 - b. Extract the zip archive.
 - c. Install the driver by running the `install.ps1` PowerShell script.

Note

If you get an execution policy error, set the policy to Unrestricted (by default it is set to Restricted or RemoteSigned). In a command line, run `Set-ExecutionPolicy -ExecutionPolicy Unrestricted`, and then run the `install.ps1` PowerShell script again.

4. From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: [stop-instances](#) (AWS CLI/AWS CloudShell), [Stop-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.
5. Enable ENA support on your instance as follows:
 - a. From your local computer, check the EC2 instance ENA support attribute on your instance by running one of the following commands. If the attribute is not enabled, the output will be "[]" or blank. EnaSupport is set to false by default.
 - [describe-instances](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-instances --instance-ids instance_id --query "Reservations[].Instances[].EnaSupport"
```
 - [Get-EC2Instance](#) (Tools for Windows PowerShell)

```
(Get-EC2Instance -InstanceId instance-id).Instances.EnaSupport
```

- b. To enable ENA support, run one of the following commands:

- [modify-instance-attribute](#) (AWS CLI/AWS CloudShell)

```
aws ec2 modify-instance-attribute --instance-id instance_id --ena-support
```

- [Edit-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -EnaSupport $true
```

If you encounter problems when you restart the instance, you can also disable ENA support using one of the following commands:

- [modify-instance-attribute](#) (AWS CLI/AWS CloudShell)

```
aws ec2 modify-instance-attribute --instance-id instance_id --no-ena-support
```

- [Edit-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -EnaSupport $false
```

- c. Verify that the attribute has been set to true using **describe-instances** or **Get-EC2Instance** as shown previously. You should now see the following output:

```
[  
 true  
]
```

6. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: [start-instances](#) (AWS CLI/AWS CloudShell), [Start-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance using the AWS OpsWorks console so that the instance state remains in sync.
7. On the instance, validate that the ENA driver is installed and enabled as follows:
 - a. Right-click the network icon and choose **Open Network and Sharing Center**.
 - b. Choose the Ethernet adapter (for example, **Ethernet 2**).
 - c. Choose **Details**. For **Network Connection Details**, check that **Description** is **Amazon Elastic Network Adapter**.
8. (Optional) Create an AMI from the instance. The AMI inherits the enaSupport attribute from the instance. Therefore, you can use this AMI to launch another instance with ENA enabled by default. For more information, see [Create a custom Windows AMI](#).

Install or upgrade Elastic Network Adapter (ENA) driver

If your instance isn't based on one of the latest Windows Amazon Machine Images (AMIs) that Amazon provides, use the following procedure to install the current ENA driver on your instance. You should perform this update at a time when it's convenient to reboot your instance. If the install script doesn't automatically reboot your instance, we recommend that you reboot the instance as the final step.

If you use an instance store volume to store data while the instance is running, that data is erased when you stop the instance. Before you stop your instance, verify that you've copied any data that you need from your instance store volumes to persistent storage, such as Amazon EBS or Amazon S3.

Prerequisites

To install or upgrade the ENA driver, your Windows instance must meet the following prerequisites:

- Have PowerShell version 3.0 or later installed

Step 1: Back up your data

We recommend that you create a backup AMI, in case you're not able to roll back your changes through the **Device Manager**. To create a backup AMI with the AWS Management Console, follow these steps:

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance that requires the driver upgrade, and choose **Stop instance** from the **Instance state** menu.
4. After the instance is stopped, select the instance again. To create your backup, choose **Image and templates** from the **Actions** menu, then choose **Create image**.
5. To restart your instance, choose **Start instance** from the **Instance state** menu.

Step 2: Install or upgrade your ENA driver

You can install or upgrade your ENA driver with AWS Systems Manager Distributor, or with PowerShell cmdlets. For further instructions, select the tab that matches the method that you want to use.

Systems Manager Distributor

You can use the Systems Manager Distributor feature to deploy packages to your Systems Manager managed nodes. With Systems Manager Distributor, you can install the ENA driver package once, or with scheduled updates. For more information about how to install the ENA driver package (`AwsEnaNetworkDriver`) with Systems Manager Distributor, see [Install or update packages](#) in the *AWS Systems Manager User Guide*.

PowerShell

This section covers how to download and install ENA driver packages on your instance with PowerShell cmdlets.

Option 1: Download and extract the latest version

1. Connect to your instance and log in as the local administrator.

2. Use the **invoke-webrequest** cmdlet to download the latest driver package:

```
PS C:\> invoke-webrequest https://ec2-windows-drivers-
downloads.s3.amazonaws.com/ENA/Latest/AwsEnaNetworkDriver.zip - 
outfile $env:USERPROFILE\AwsEnaNetworkDriver.zip
```

 **Note**

Alternatively, you can download the latest driver package from a browser window on your instance.

3. Use the **expand-archive** cmdlet to extract the zip archive that you downloaded to your instance:

```
PS C:\> expand-archive $env:userprofile\AwsEnaNetworkDriver.zip - 
DestinationPath $env:userprofile\AwsEnaNetworkDriver
```

Option 2: Download and extract a specific version

1. Connect to your instance and log in as the local administrator.
2. Download the ENA driver package for the specific version you want from the version link in the [Amazon ENA driver versions](#) table.
3. Extract the zip archive to your instance.

Install the ENA driver with PowerShell

The install steps are the same whether you've downloaded the latest driver or a specific version. To install the ENA driver, follow these steps.

1. To install the driver, run the `install.ps1` PowerShell script from the `AwsEnaNetworkDriver` directory on your instance. If you get an error, make sure that you're using PowerShell 3.0 or later.
2. If the installer doesn't automatically reboot your instance, run the **Restart-Computer** PowerShell cmdlet.

```
PS C:\> Restart-Computer
```

Step 3 (optional): Verify the ENA driver version after installation

To ensure that the ENA driver package was successfully installed on your instance, you can verify the new version as follows:

1. Connect to your instance and log in as the local administrator.
2. To open the Windows Device Manager, enter devmgmt.msc in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.

 **Note**

ENA adapters all use the same driver. If you have multiple ENA adapters, you can select any one of them to update the driver for all of the ENA adapters.

6. To verify the current version that's installed, open the **Driver** tab and check the **Driver Version**. If the current version doesn't match your target version, see [Troubleshoot the Elastic Network Adapter \(ENA\) Windows driver](#).

Roll back an ENA driver installation

If anything goes wrong with the installation, you might need to roll back the driver. Follow these steps to roll back to the previous version of the ENA driver that was installed on your instance.

1. Connect to your instance and log in as the local administrator.
2. To open the Windows Device Manager, enter devmgmt.msc in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.

Note

ENAs all use the same driver. If you have multiple ENA adapters, you can select any one of them to update the driver for all of the ENA adapters.

- To roll back the driver, open the **Driver** tab and choose **Roll Back Driver**. This opens the **Driver Package rollback** window.

Note

If the **Driver** tab doesn't show the **Roll Back Driver** action, or if the action is unavailable, it means that the [Driver Store](#) on your instance doesn't contain the previously installed driver package. To troubleshoot this issue, see [Troubleshooting scenarios](#), and expand the **Unexpected ENA driver version installed** section. For more information about the device driver package selection process, see [How Windows selects a driver package for a device](#) on the *Microsoft documentation website*.

Amazon ENA driver versions

Windows AMIs include the Amazon ENA driver to enable enhanced networking.

The following table shows the corresponding ENA driver version to download for each Windows Server version.

Windows Server version	ENA driver version
Windows Server 2022	2.4.0 and later
Windows Server 2019	latest
Windows Server 2016	latest
Windows Server 2012 R2	2.6.0 and earlier
Windows Server 2012	2.6.0 and earlier

Windows Server version	ENAv driver version
Windows Server 2008 R2	2.2.3 and earlier

The following table summarizes the changes for each release.

Driver version	Details	Release date
2.6.0	<p>New Features</p> <ul style="list-style-type: none"> • Adds the following network performance metrics for instance types that support ENA Express. <ul style="list-style-type: none"> • <code>ena_srd_mode</code> • <code>ena_srd_tx_pkts</code> • <code>ena_srd_eligible_tx_pkts</code> • <code>ena_srd_rx_pkts</code> • <code>ena_srd_resource_utilization</code> • Adds <code>conntrack_allowance_available</code> network performance metric for Nitro based instance types. • Adds new adapter reset reason due to detection of RX data corruption. • Updates driver logging infrastructure. <p>Bug Fixes</p> <ul style="list-style-type: none"> • 	June 20, 2023

Driver version	Details	Release date
	<p>Prevents adapter reset in the event that CPU starvation causes a network performance metrics update to fail.</p> <ul style="list-style-type: none">Prevents false detection of an interruption to the device heartbeat.Fixes driver installation script to support downgrade operation.Fixes the receive error count statistic.	
2.5.0	<p>Announcement</p> <p>ENA Windows driver version 2.5.0 has been rolled back due to failure to initialize on the Windows domain controller. Windows Client and Windows Server are unaffected.</p>	February 17, 2023

Driver version	Details	Release date
<u>2.4.0</u>	<p>New Features</p> <ul style="list-style-type: none">• Adds support for Windows Server 2022.• Removes support for Windows Server 2008 R2.• Sets Low Latency Queuing (LLQ) to always on to improve performance on sixth generation Amazon EC2 instances. <p>Bug Fix</p> <ul style="list-style-type: none">• Fixes a failure to publish network performance metrics to the Performance Counters for Windows (PCW) system.• Fixes a memory leak during the registry key reading operation.• Prevents an infinite reset loop in the event of an unrecoverable error during the adapter reset process.	April 28, 2022

Driver version	Details	Release date
2.2.4	<p>Announcement</p> <p>ENA Windows driver version 2.2.4 has been rolled back due to potential performance degradation on the sixth generation EC2 instances. We recommend that you downgrade the driver, using one of the following methods:</p> <ul style="list-style-type: none">• Install the previous version<ol style="list-style-type: none">1. Download the previous version package from the link in this table (version 2.2.3).2. Run the install.ps1 PowerShell installation script. <p>For more details for pre- and post-installation steps see Enable enhanced networking on Windows.</p> <p>Use Amazon EC2 Systems Manager for a bulk update</p> <ul style="list-style-type: none">• Perform a bulk update via SSM document AWS-ConfigureAWSPackage , with the following parameters:<ul style="list-style-type: none">• Name: AwsEnaNetworkDriver• Version: 2.2.3	<i>October 26, 2021</i>

Driver version	Details	Release date
<u>2.2.3</u>	<p>New Feature</p> <ul style="list-style-type: none"> • Adds support for new Nitro cards with up to 400 Gbps instance networking. <p>Bug Fix</p> <ul style="list-style-type: none"> • Fixes race condition between system time change and system time query by the ENA driver, which causes false-positive detection of HW unresponsiveness. <p>Windows ENA driver version 2.2.3 is the final version that supports Windows Server 2008 R2. Currently available instance types that use ENA will continue to be supported on Windows Server 2008 R2, and the drivers are available by download. No future instance types will support Windows Server 2008 R2, and you cannot launch, import, or migrate Windows Server 2008 R2 images to future instance types.</p>	March 25, 2021
<u>2.2.2</u>	<p>New Feature</p> <ul style="list-style-type: none"> • Adds support to query network adapter performance metrics with CloudWatch and the Performance Counters for Windows consumers. <p>Bug Fix</p> <ul style="list-style-type: none"> • Fixes performance issues on bare metal instances. 	December 21, 2020

Driver version	Details	Release date
2.2.1	<p>New Feature</p> <ul style="list-style-type: none"> • Adds a method to allow the host to query the Elastic Network Adapter for network performance metrics. 	October 1, 2020
2.2.0	<p>New Features</p> <ul style="list-style-type: none"> • Adds support for next generation hardware types. • Improves instance start time after resuming from sleep-hibernate, and eliminates false positive ENA error messages. <p>Performance Optimizations</p> <ul style="list-style-type: none"> • Optimizes processing of inbound traffic. • Improves shared memory management in low resource environment. <p>Bug Fix</p> <ul style="list-style-type: none"> • Avoids system crash upon ENA device removal in rare scenario where driver fails to reset. 	August 12, 2020
2.1.5	<p>Bug Fix</p> <ul style="list-style-type: none"> • Fixes occasional network adapter initialization failure on bare metal instances. 	June 23, 2020

Driver version	Details	Release date
<u>2.1.4</u>	<p>Bug Fixes</p> <ul style="list-style-type: none"> • Prevent connectivity issues caused by corrupted LSO packet metadata arriving from the network stack. • Prevent system crash caused by a rare race condition that results in accessing an already released packet memory. 	November 25, 2019
<u>2.1.2</u>	<p>New Feature</p> <ul style="list-style-type: none"> • Added support for vendor ID report to allow OS to generate MAC-based UUIDs. <p>Bug Fixes</p> <ul style="list-style-type: none"> • Improved DHCP network configuration performance during initialization. • Properly calculate L4 checksum on inbound IPv6 traffic when the maximum transmission unit (MTU) exceeds 4K. • General improvements to driver stability and minor bug fixes. 	November 4, 2019

Driver version	Details	Release date
<u>2.1.1</u>	<p>Bug Fixes</p> <ul style="list-style-type: none">Prevent drops of highly fragmented TCP LSO packets arriving from operating system.Properly handle Encapsulating Security Payload (ESP) protocol within the IPSec in IPv6 networks.	September 16, 2019

Driver version	Details	Release date
2.1.0	<p>ENA Windows driver v2.1 introduces new ENA device capabilities, provides a performance boost, adds new features, and includes multiple stability improvements.</p> <ul style="list-style-type: none"> • New features <ul style="list-style-type: none"> • Use standardized Windows registry key for Jumbo frames configuration. • Allow VLAN ID setting via the ENA driver properties GUI. • Improved Recovery flows <ul style="list-style-type: none"> • Improved failure identification mechanism. • Added support for tunable recovery parameters. • Support up to 32 I/O queues for newer EC2 instances that have more than 8 vCPUs. • ~90% reduction of driver memory footprint. • Performance optimizations <ul style="list-style-type: none"> • Reduced transmit path latency. • Support for receive checksum offload. • Performance optimization for heavily loaded system (optimized usage of locking mechanisms). • Further enhancements to reduce CPU utilization and improve system responsiveness under load. • Bug Fixes 	July 1, 2019

Driver version	Details	Release date
	<ul style="list-style-type: none"> • Fix crash due to invalid parsing of non-contiguous Tx headers. • Fix driver v1.5 crash during the elastic network interface detach on Bare Metal instances. • Fix LSO pseudo-header checksum calculation error over IPv6. • Fix potential memory resource leak upon initialization failure. • Disable TCP/UDP checksum offload for IPv4 fragments. • Fix for VLAN configuration. VLAN was incorrectly disabled when only VLAN priority should have been disabled. • Enable correct parsing of custom driver messages by the event viewer. • Fix failure to initialize driver due to invalid timestamp handling. • Fix race condition between data processing and ENA device disabling. 	
1.5.0	<ul style="list-style-type: none"> • Improved stability and performance fixes. • Receive Buffers can now be configured up to a value of 8192 in Advanced Properties of the ENA NIC. • Default Receive Buffers of 1k. 	October 4, 2018

Driver version	Details	Release date
1.2.3	Includes reliability fixes and unifies support for Windows Server 2008 R2 through Windows Server 2016.	February 13, 2018
1.0.8	The initial release. Included in AMIs for Windows Server 2008 R2, Windows Server 2012 RTM, Windows Server 2012 R2, and Windows Server 2016.	July 2016

Subscribe to notifications

Amazon SNS can notify you when new versions of EC2 Windows Drivers are released. Use the following procedure to subscribe to these notifications.

To subscribe to EC2 notifications

1. Open the Amazon SNS console at <https://console.aws.amazon.com/sns/v3/home>.
2. In the navigation bar, change the Region to **US East (N. Virginia)**, if necessary. You must select this Region because the SNS notifications that you are subscribing to are in this Region.
3. In the navigation pane, choose **Subscriptions**.
4. Choose **Create subscription**.
5. In the **Create subscription** dialog box, do the following:
 - a. For **TopicARN**, copy the following Amazon Resource Name (ARN):

```
arn:aws:sns:us-east-1:801119661308:ec2-windows-drivers
```
 - b. For **Protocol**, choose Email.
 - c. For **Endpoint**, enter an email address that you can use to receive the notifications.
 - d. Choose **Create subscription**.
6. You'll receive a confirmation email. Open the email and follow the directions to complete your subscription.

Whenever new EC2 Windows drivers are released, we send notifications to subscribers. If you no longer want to receive these notifications, use the following procedure to unsubscribe.

To unsubscribe from Amazon EC2 Windows driver notification

1. Open the Amazon SNS console at <https://console.aws.amazon.com/sns/v3/home>.
2. In the navigation pane, choose **Subscriptions**.
3. Select the check box for the subscription and then choose **Actions, Delete subscriptions**. When prompted for confirmation, choose **Delete**.

Improve network performance with ENA Express on Windows instances

ENA Express is powered by AWS Scalable Reliable Datagram (SRD) technology. SRD is a high performance network transport protocol that uses dynamic routing to increase throughput and minimize tail latency. With ENA Express, you can communicate between two EC2 instances in the same subnet.

Benefits of ENA Express

- Increases the maximum bandwidth a single flow can use from 5 Gbps to 25 Gbps within the subnet, up to the aggregate instance limit.
- Reduces tail latency of network traffic between EC2 instances, especially during periods of high network load.
- Detects and avoids congested network paths.
- Handles some tasks directly in the network layer, such as packet reordering on the receiving end, and most retransmits that are needed. This frees up the application layer for other work.

Note

If your application sends or receives a high volume of packets per second, and needs to optimize for latency most of the time, especially during periods when there is no congestion on the network, [Enhanced networking](#) might be a better fit for your network.

During periods of time when network traffic is light, you might notice a slight increase in packet latency (tens of microseconds) when the packet uses ENA Express. During those times, applications

that prioritize specific network performance characteristics can benefit from ENA Express as follows:

- Processes can benefit from increased maximum single flow bandwidth from 5 Gbps to 25 Gbps within the same subnet, up to the aggregate instance limit. For example, if a specific instance type supports up to 12.5 Gbps, the single flow bandwidth is also limited to 12.5 Gbps.
- Longer running processes should experience reduced tail latency during periods of network congestion.
- Processes can benefit from a smoother and more standard distribution for network response times.

How ENA Express works

ENA Express is powered by AWS Scalable Reliable Datagram (SRD) technology. It distributes packets for each network flow across different AWS network paths, and dynamically adjusts distribution when it detects signs of congestion. It also manages packet reordering on the receiving end.

To ensure that ENA Express can manage network traffic as intended, sending and receiving instances and the communication between them must meet all of the following requirements:

- Both sending and receiving instance types are supported. See the [Supported instance types for ENA Express](#) table for more information.
- Both sending and receiving instances must have ENA Express configured. If there are differences in the configuration, you can run into situations where traffic defaults to standard ENA transmission. The following scenario shows what can happen.

Scenario: Differences in configuration

Instance	ENA Express Enabled	UDP uses ENA Express
Instance 1	Yes	Yes
Instance 2	Yes	No

In this case, TCP traffic between the two instances can use ENA Express, as both instances have enabled it. However, since one of the instances does not use ENA Express for UDP traffic, communication between these two instances over UDP uses standard ENA transmission.

- The sending and receiving instances must run in the same subnet.
- The network path between the instances must not include middleware boxes. ENA Express doesn't currently support middleware boxes.

If any requirement is unmet, the instances use the standard TCP/UDP protocol but without SRD to communicate.

 **Note**

Amazon EC2 refers to the relationship between an instance and a network interface that's attached to it as an *attachment*. ENA Express settings apply to the attachment. If the network interface is detached from the instance, the attachment no longer exists, and the ENA Express settings that applied to it are no longer in force. The same is true when an instance is terminated, even if the network interface remains.

Supported instance types for ENA Express

The following table contains instance types that support ENA Express.

Instance type	Architecture
General purpose	
m6a.48xlarge	x86_64
m6a.metal	x86_64
m6i.8xlarge	x86_64
m6i.12xlarge	x86_64
m6i.16xlarge	x86_64

Instance type	Architecture
m6i.24xlarge	x86_64
m6i.32xlarge	x86_64
m6i.metal	x86_64
m6id.8xlarge	x86_64
m6id.12xlarge	x86_64
m6id.16xlarge	x86_64
m6id.24xlarge	x86_64
m6id.32xlarge	x86_64
m6id.metal	x86_64
m7i.12xlarge	x86_64
m7i.16xlarge	x86_64
m7i.24xlarge	x86_64
m7i.48xlarge	x86_64
m7i.metal-24xl	x86_64
m7i.metal-48xl	x86_64
Compute optimized	
c6a.48xlarge	x86_64
c6a.metal	x86_64
c6i.8xlarge	x86_64
c6i.12xlarge	x86_64

Instance type	Architecture
c6i.16xlarge	x86_64
c6i.24xlarge	x86_64
c6i.32xlarge	x86_64
c6i.metal	x86_64
c6id.8xlarge	x86_64
c6id.12xlarge	x86_64
c6id.16xlarge	x86_64
c6id.24xlarge	x86_64
c6id.32xlarge	x86_64
c6id.metal	x86_64
c7i.12xlarge	x86_64
c7i.16xlarge	x86_64
c7i.24xlarge	x86_64
c7i.48xlarge	x86_64
c7i.metal-24xl	x86_64
c7i.metal-48xl	x86_64
Memory optimized	
r6a.48xlarge	x86_64
r6a.metal	x86_64

i4i.metal	x86_64

List and view ENA Express settings

This section covers how to list and view ENA Express information from the AWS Management Console or from the AWS CLI. For more information, choose the tab that matches the method you'll use.

Console

This tab covers how to find information about your current ENA Express settings and to view instance type support in the AWS Management Console.

View instance type support

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instance types**.
3. Select an instance type to see the details for that instance. You can choose the **Instance type** link to open the detail page, or you can select the checkbox on the left side of the list to view details in the detail pane at the bottom of the page.
4. In the **Networking** tab or that section on the detail page, **ENA Express support** shows a true or false value to indicate if the instance type supports this feature.

View settings from the Network interface list

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Network interfaces**.
3. Select a network interface to see the details for that instance. You can choose the **Network interface ID** link to open the detail page, or you can select the checkbox on the left side of the list to view details in the detail pane at the bottom of the page.
4. In the **Network interface attachment** section on the the **Details** tab or detail page, review settings for **ENA Express** and **ENA Express UDP**.

View settings from instances

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instances**.
3. Select an instance to see the details for that instance. You can choose the **Instance ID** link to open the detail page, or you can select the checkbox on the left side of the list to view details in the detail pane at the bottom of the page.
4. In the **Network interfaces** section on the **Networking** tab, scroll right to review settings for **ENA Express** and **ENA Express UDP**.

AWS CLI

This tab covers how to find information about your current ENA Express settings and to view instance type support in the AWS CLI.

Describe instance types

For information on instance type settings for a specific instance type, run the [describe-instance-types](#) command in the AWS CLI, and substitute the instance type as follows:

```
[ec2-user ~]$ aws ec2 describe-instance-types --instance-types m6i.metal
{
  "InstanceTypes": [
    {
      "InstanceType": "m6i.metal",
      "CurrentGeneration": true,
      ...
    },
    "NetworkInfo": {
      ...
      "EnaSrdSupported": true
    },
    ...
  }
}
```

Describe network interfaces

For information on ENA Express settings for a networking interface, run the [describe-network-interfaces](#) command in the AWS CLI as follows:

```
[ec2-user ~]$ aws ec2 describe-network-interfaces
{
  "NetworkInterfaces": [
    {
      "Association": {
        .... IPs, DNS...
      },
      "Attachment": {
        "AttachTime": "2022-11-17T09:04:28+00:00",
        "AttachmentId": "eni-attach-0ab1c23456d78e9f0",
        "DeleteOnTermination": true,
        "DeviceIndex": 0,
        "NetworkCardIndex": 0,
        "InstanceId": "i-0abcd123e456fabcd",
        "InstanceOwnerId": "111122223333",
        "Status": "attached",
        "EnaSrdSpecification": {
          "EnaSrdEnabled": true,
        }
      }
    }
  ]
}
```

```
"EnaSrdUdpSpecification": {  
    "EnaSrdUdpEnabled": true  
}  
}  
},  
...  
"NetworkInterfaceId": "eni-0d1234e5f6a78901b",  
"OwnerId": "111122223333",  
...  
}  
]  
}
```

PowerShell

This tab covers how to find information about your current ENA Express settings and to view instance type support using PowerShell.

Describe instance types

For information on instance type settings for a specific instance type, run the [Get-EC2InstanceType Cmdlet](#) with the Tools for PowerShell, and substitute the instance type as follows:

```
PS C:\> Get-EC2InstanceType -InstanceType m6i.metal | `  
Select-Object `'  
    InstanceType,  
    CurrentGeneration,  
    @{Name = 'EnaSrdSupported'; Expression = { $_.NetworkInfo.EnaSrdSupported } } | `  
`  
Format-List  
  
InstanceType      : m6i.metal  
CurrentGeneration : True  
EnaSrdSupported  : True
```

If ENA Express is enabled, a value of True is returned.

Describe network interfaces

For information on ENA Express settings for a networking interface, run the [Get-EC2NetworkInterface Cmdlet](#) with the Tools for PowerShell as follows:

```
PS C:\> Get-EC2NetworkInterface -NetworkInterfaceId eni-0d1234e5f6a78901b | `  
Select-Object `'  
Association,  
NetworkInterfaceId,  
OwnerId,  
@{Name = 'AttachTime'; Expression = { $_.Attachment.AttachTime } },  
@{Name = 'AttachmentId'; Expression = { $_.Attachment.AttachmentId } },  
@{Name = 'DeleteOnTermination'; Expression =  
{ $_.Attachment.DeleteOnTermination } },  
@{Name = 'NetworkCardIndex'; Expression = { $_.Attachment.NetworkCardIndex } },  
@{Name = 'InstanceId'; Expression = { $_.Attachment.InstanceId } },  
@{Name = 'InstanceOwnerId'; Expression = { $_.Attachment.InstanceOwnerId } },  
@{Name = 'Status'; Expression = { $_.Attachment.Status } },  
@{Name = 'EnaSrdEnabled'; Expression =  
{ $_.Attachment.EnaSrdSpecification.EnaSrdEnabled } },  
@{Name = 'EnaSrdUdpEnabled'; Expression =  
{ $_.Attachment.EnaSrdSpecification.EnaSrdUdpSpecification.EnaSrdUdpEnabled } }  
  
Association :  
NetworkInterfaceId : eni-0d1234e5f6a78901b  
OwnerId : 111122223333  
AttachTime : 6/11/2022 1:13:11 AM  
AttachmentId : eni-attach-0d1234e5f6a78901b  
DeleteOnTermination : True  
NetworkCardIndex : 0  
InstanceId : i-0d1234e5f6a78901b  
InstanceOwnerId : 111122223333  
Status : attached  
EnaSrdEnabled : True  
EnaSrdUdpEnabled : False
```

Configure ENA Express settings

You can configure ENA Express for supported EC2 instance types without needing to install any additional software. This section covers how to configure ENA Express from the AWS Management Console or from the AWS CLI. For more information, choose the tab that matches the method you'll use.

Console

This tab covers how to manage ENA Express settings for network interfaces that are attached to an instance.

Manage ENA Express from the Network interface list

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Network interfaces**.
3. Select a network interface that is attached to an instance. You can choose the **Network interface ID** link to open the detail page, or you can select the checkbox on the left side of the list.
4. Choose **Manage ENA Express** from the **Action** menu at the top right side of the page. This opens the **Manage ENA Express** dialog, with the selected network interface ID and current settings displayed.

 **Note**

If the network interface you selected is not attached to an instance, this action does not appear in the menu.

5. To use **ENA Express**, select the **Enable** check box.
6. When ENA Express is enabled, you can configure UDP settings. To use **ENA Express UDP**, select the **Enable** check box.
7. To save your settings, choose **Save**.

Manage ENA Express from the Instance list

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instances**.
3. Select the instance that you want to manage. You can choose the **Instance ID** to open the detail page, or you can select the checkbox on the left side of the list.
4. Select the **Network interface** to configure for your instance.
5. Choose **Manage ENA Express** from the **Action** menu at the top right side of the page.
6. To configure ENA Express for a network interface that's attached to your instance, select it from the **Network interface** list.

7. To use **ENa Express** for the selected network interface attachment, select the **Enable** check box.
8. When ENa Express is enabled, you can configure UDP settings. To use **ENa Express UDP**, select the **Enable** check box.
9. To save your settings, choose **Save**.

Configure ENa Express when you attach a network interface to an EC2 instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Network interfaces**.
3. Select a network interface that is not attached to an instance (**Status** is *Available*). You can choose the **Network interface ID** link to open the detail page, or you can select the checkbox on the left side of the list.
4. Select the **Instance** that you'll attach to.
5. To use **ENa Express** after you attach the network interface to the instance, select the **Enable** check box.
6. When ENa Express is enabled, you can configure UDP settings. To use **ENa Express UDP**, select the **Enable** check box.
7. To attach the network interface to the instance and save your ENa Express settings, choose **Attach**.

AWS CLI

This tab covers how to configure ENa Express settings in the AWS CLI.

Configure ENa Express when you attach a network interface

To configure ENa Express when you attach a network interface to an instance, run the [attach-network-interface](#) command in the AWS CLI, as shown in the following examples:

Example 1: Use ENa Express for TCP traffic, but not for UDP traffic

In this example, we configure `EnaSrdEnabled` as `true`, and we allow `EnaSrdUdpEnabled` to default to `false`.

```
[ec2-user ~]$ aws ec2 attach-network-interface --network-interface-
id eni-0123f4567890a1b23 --instance-id i-0f1a234b5cd67e890 --device-index 1 --ena-
srd-specification 'EnaSrdEnabled=true'
{
"AttachmentId": "eni-attach-012c3d45e678f9012"
}
```

Example 2: Use ENA Express for both TCP traffic and UDP traffic

In this example, we configure both EnaSrdEnabled and EnaSrdUdpEnabled as *true*.

```
[ec2-user ~]$ aws ec2 attach-network-interface --network-interface-
id eni-0123f4567890a1b23 --instance-id i-0f1a234b5cd67e890 --device-index 1 --ena-
srd-specification
'EnaSrdEnabled=true,EnaSrdUdpSpecification={EnaSrdUdpEnabled=true}'
{
"AttachmentId": "eni-attach-012c3d45e678f9012"
}
```

Update ENA Express settings for your network interface attachment

To update ENA Express settings for a network interface that's attached to an instance, run the [modify-network-interface-attribute](#) command in the AWS CLI, as shown in the following examples:

Example 1: Use ENA Express for TCP traffic, but not for UDP traffic

In this example, we configure EnaSrdEnabled as *true*, and we allow EnaSrdUdpEnabled to default to *false* if it has never been set previously.

```
[ec2-user ~]$ aws ec2 modify-network-interface-attribute --network-interface-
id eni-0123f4567890a1b23 --ena-srd-specification 'EnaSrdEnabled=true'
```

Example 2: Use ENA Express for both TCP traffic and UDP traffic

In this example, we configure both EnaSrdEnabled and EnaSrdUdpEnabled as *true*.

```
[ec2-user ~]$ aws ec2 modify-network-interface-attribute --
network-interface-id eni-0123f4567890a1b23 --ena-srd-specification
'EnaSrdEnabled=true,EnaSrdUdpSpecification={EnaSrdUdpEnabled=true}'
```

Example 3: Stop using ENA Express for UDP traffic

In this example, we configure EnaSrdUdpEnabled as *false*.

```
[ec2-user ~]$ aws ec2 modify-network-interface-attribute --  
network-interface-id eni-0123f4567890a1b23 --ena-srd-specification  
'EnaSrdUdpSpecification={EnaSrdUdpEnabled=false}'
```

PowerShell

This tab covers how to configure ENA Express settings using PowerShell.

Configure ENA Express when you attach a network interface

To configure ENA Express settings for a networking interface, run the [Add-EC2NetworkInterface Cmdlet](#) with the Tools for PowerShell as shown in the following examples:

Example 1: Use ENA Express for TCP traffic, but not for UDP traffic

In this example, we configure EnaSrdEnabled as *true*, and we allow EnaSrdUdpEnabled to default to *false*.

```
PS C:\> Add-EC2NetworkInterface `  
-NetworkInterfaceId eni-0123f4567890a1b23 `  
-InstanceId i-0f1a234b5cd67e890 `  
-DeviceIndex 1 `  
-EnaSrdSpecification_EnaSrdEnabled $true  
  
eni-attach-012c3d45e678f9012
```

Example 2: Use ENA Express for both TCP traffic and UDP traffic

In this example, we configure both EnaSrdEnabled and EnaSrdUdpEnabled as *true*.

```
PS C:\> Add-EC2NetworkInterface `  
-NetworkInterfaceId eni-0123f4567890a1b23 `  
-InstanceId i-0f1a234b5cd67e890 `  
-DeviceIndex 1 `  
-EnaSrdSpecification_EnaSrdEnabled $true `  
-EnaSrdUdpSpecification_EnaSrdUdpEnabled $true
```

```
eni-attach-012c3d45e678f9012
```

Update ENA Express settings for your network interface attachment

To update ENA Express settings for a network interface that's attached to an instance, run the [Add-EC2NetworkInterface Cmdlet](#) command in the Tools for PowerShell, as shown in the following examples:

Example 1: Use ENA Express for TCP traffic, but not for UDP traffic

In this example, we configure `EnaSrdEnabled` as *true*, and we allow `EnaSrdUdpEnabled` to default to *false* if it has never been set previously.

```
PS C:\> Edit-EC2NetworkInterfaceAttribute ` 
-NetworkInterfaceId eni-0123f4567890a1b23 ` 
-EnaSrdSpecification_EnaSrdEnabled $true ; 
Get-EC2NetworkInterface -NetworkInterfaceId eni-0123f4567890a1b23 | ` 
Select-Object ` 
    NetworkInterfaceId, 
    @{Name = 'EnaSrdEnabled'; Expression = 
    { $_.Attachment.EnaSrdSpecification.EnaSrdEnabled }}, 
    @{Name = 'EnaSrdUdpEnabled'; Expression = 
    { $_.Attachment.EnaSrdSpecification.EnaSrdUdpSpecification.EnaSrdUdpEnabled }} | ` 
Format-List

NetworkInterfaceId : eni-0123f4567890a1b23
EnaSrdEnabled      : True
EnaSrdUdpEnabled   : False
```

Example 2: Use ENA Express for both TCP traffic and UDP traffic

In this example, we configure both `EnaSrdEnabled` and `EnaSrdUdpEnabled` as *true*.

```
PS C:\> Edit-EC2NetworkInterfaceAttribute ` 
-NetworkInterfaceId eni-0123f4567890a1b23 ` 
-EnaSrdSpecification_EnaSrdEnabled $true ` 
-EnaSrdSpecification_EnaSrdUdpSpecification_EnaSrdUdpEnabled $true ; 
Get-EC2NetworkInterface -NetworkInterfaceId eni-0123f4567890a1b23 | ` 
Select-Object ` 
    NetworkInterfaceId, 
    @{Name = 'EnaSrdEnabled'; Expression = 
    { $_.Attachment.EnaSrdSpecification.EnaSrdEnabled }},
```

```
@{Name = 'EnaSrdUdpEnabled'; Expression =
{ $_.Attachment.EnaSrdSpecification.EnaSrdUdpSpecification.EnaSrdUdpEnabled }} | `

Format-List

NetworkInterfaceId : eni-0123f4567890a1b23
EnaSrdEnabled      : True
EnaSrdUdpEnabled   : True
```

Example 3: Stop using ENA Express for UDP traffic

In this example, we configure EnaSrdUdpEnabled as *false*.

```
PS C:\> Edit-EC2NetworkInterfaceAttribute `

-NetworkInterfaceId eni-0123f4567890a1b23 `

-EnaSrdSpecification_EnaSrdUdpSpecification_EnaSrdUdpEnabled $false ;
Get-EC2NetworkInterface -NetworkInterfaceId eni-0123f4567890a1b23 | `

Select-Object `

    NetworkInterfaceId,
    @{Name = 'EnaSrdEnabled'; Expression =
{ $_.Attachment.EnaSrdSpecification.EnaSrdEnabled }},
    @{Name = 'EnaSrdUdpEnabled'; Expression =
{ $_.Attachment.EnaSrdSpecification.EnaSrdUdpSpecification.EnaSrdUdpEnabled }} | `

Format-List

NetworkInterfaceId : eni-0123f4567890a1b23
EnaSrdEnabled      : True
EnaSrdUdpEnabled   : False
```

Configure ENA Express when you launch an EC2 instance

You can use one of the following methods to configure ENA Express for an AMI when you launch an instance from the AWS Management Console.

- You can configure ENA Express for your AMI when you launch an instance with the launch instance wizard. For configuration details, see **Advanced network configuration** in the [Network settings](#) for the launch instance wizard.
- You can configure ENA Express for your AMI when you use a launch template. For more information about launch template configuration, see **Advanced network configuration** in the [Network settings](#) for launch templates.

Enable enhanced networking with the Intel 82599 VF interface on Windows instances

Amazon EC2 provides enhanced networking capabilities through the Intel 82599 VF interface, which uses the Intel ixgbevf driver.

Contents

- [Requirements](#)
- [Test whether enhanced networking is enabled](#)
- [Enable enhanced networking on Windows](#)

Requirements

To prepare for enhanced networking using the Intel 82599 VF interface, set up your instance as follows:

- Select from the following supported instance types: C3, C4, D2, I2, M4 (excluding m4.16xlarge), and R3.
- Launch the instance from a 64-bit HVM AMI. You can't enable enhanced networking on Windows Server 2008 and Windows Server 2003. Enhanced networking is already enabled for Windows Server 2012 R2 and Windows Server 2016 and later AMIs. Windows Server 2012 R2 includes Intel driver 1.0.15.3 and we recommend that you upgrade that driver to the latest version using the Pnutil.exe utility.
- Ensure that the instance has internet connectivity.
- Use [AWS CloudShell](#) from the AWS Management Console, or install and configure the [AWS CLI](#) or the [AWS Tools for Windows PowerShell](#) on any computer you choose, preferably your local desktop or laptop. For more information, see [Access Amazon EC2](#) or the [AWS CloudShell User Guide](#). Enhanced networking cannot be managed from the Amazon EC2 console.
- If you have important data on the instance that you want to preserve, you should back that data up now by creating an AMI from your instance. Updating kernels and kernel modules, as well as enabling the sriovNetSupport attribute, might render incompatible instances or operating systems unreachable. If you have a recent backup, your data will still be retained if this happens.

Test whether enhanced networking is enabled

Enhanced networking with the Intel 82599 VF interface is enabled if the driver is installed on your instance and the `sriovNetSupport` attribute is set.

Driver

To verify that the driver is installed, connect to your instance and open Device Manager. You should see "Intel(R) 82599 Virtual Function" listed under **Network adapters**.

Instance attribute (`sriovNetSupport`)

To check whether an instance has the enhanced networking `sriovNetSupport` attribute set, use one of the following commands:

AWS CLI

[describe-instance-attribute](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-instance-attribute --instance-id instance_id --attribute sriovNetSupport
```

PowerShell

[Get-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
Get-EC2InstanceAttribute -InstanceId instance-id -Attribute sriovNetSupport
```

If the attribute isn't set, `SriovNetSupport` is empty. If the attribute is set, the value is simple, as shown in the following example output.

```
"SriovNetSupport": {  
    "Value": "simple"  
},
```

Image attribute (`sriovNetSupport`)

To check whether an AMI already has the enhanced networking `sriovNetSupport` attribute set, use one of the following commands:

AWS CLI

[describe-images](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-images --image-id ami_id --query "Images[].SriovNetSupport"
```

PowerShell

[Get-EC2Image](#) (AWS Tools for Windows PowerShell)

```
(Get-EC2Image -ImageId ami-id).SriovNetSupport
```

If the attribute isn't set, SriovNetSupport is empty. If the attribute is set, the value is simple.

Enable enhanced networking on Windows

If you launched your instance and it does not have enhanced networking enabled already, you must download and install the required network adapter driver on your instance, and then set the sriovNetSupport instance attribute to activate enhanced networking. You can only enable this attribute on supported instance types. For more information, see [Enhanced networking support](#).

⚠ Important

To view the latest version of the Intel driver in the Windows AMIs, see [Details about AWS Windows AMI versions](#).

⚠ Warning

There is no way to disable the enhanced networking attribute after you've enabled it.

To enable enhanced networking

1. Connect to your instance and log in as the local administrator.
2. [Windows Server 2016 and later] Run the following EC2 Launch PowerShell script to configure the instance after the driver is installed.

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -  
Schedule
```

Important

The administrator password will reset when you enable the initialize instance EC2 Launch script. You can modify the configuration file to disable the administrator password reset by specifying it in the settings for the initialization tasks. For steps on how to disable password reset, see [Configure initialization tasks](#).

3. From the instance, download the Intel network adapter driver for your operating system:

- **Windows Server 2022**

Visit the [download page](#) and download `Wired_driver_version_x64.zip`.

- **Windows Server 2019** including for Server version 1809 and later*

Visit the [download page](#) and download `Wired_driver_version_x64.zip`.

- **Windows Server 2016** including for Server version 1803 and earlier*

Visit the [download page](#) and download `Wired_driver_version_x64.zip`.

- **Windows Server 2012 R2**

Visit the [download page](#) and download `Wired_driver_version_x64.zip`.

- **Windows Server 2012**

Visit the [download page](#) and download `Wired_driver_version_x64.zip`.

- **Windows Server 2008 R2**

Visit the [download page](#) and download `PROWinx64Legacy.exe`.

*Server versions 1803 and earlier as well as 1809 and later are not specifically addressed on the Intel Drivers and Software pages.

4. Install the Intel network adapter driver for your operating system.

- **Windows Server 2008 R2**

1. In the **Downloads** folder, locate the PROWinx64Legacy.exe file and rename it to PROWinx64Legacy.zip.
2. Extract the contents of the PROWinx64Legacy.zip file.
3. Open the command line, navigate to the extracted folder, and run the following command to use the pnputil utility to add and install the INF file in the driver store.

```
C:\> pnputil -a PROXGB\Winx64\NDIS62\vxn62x64.inf
```

- **Windows Server 2022, Windows Server 2019, Windows Server 2016, Windows Server 2012 R2, and Windows Server 2012**
 1. In the **Downloads** folder, extract the contents of the **Wired_driver_version_x64.zip** file.
 2. In the extracted folder, locate the **Wired_driver_version_x64.exe** file and rename it to **Wired_driver_version_x64.zip**.
 3. Extract the contents of the **Wired_driver_version_x64.zip** file.
 4. Open the command line, navigate to the extracted folder, and run one of the following commands to use the pnputil utility to add and install the INF file in the driver store.
 - Windows Server 2022

```
C:\> pnutil -i -a PROXGB\Winx64\WS2022\vxs.inf
```
 - Windows Server 2019

```
C:\> pnutil -i -a PROXGB\Winx64\NDIS68\vxn68x64.inf
```
 - Windows Server 2016

```
C:\> pnutil -i -a PROXGB\Winx64\NDIS65\vxn65x64.inf
```
 - Windows Server 2012 R2

```
C:\> pnutil -i -a PROXGB\Winx64\NDIS64\vxn64x64.inf
```
 - Windows Server 2012

```
C:\> pnutil -i -a PROXGB\Winx64\NDIS63\vxn63x64.inf
```

5. From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: [stop-instances](#) (AWS CLI), [Stop-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.
6. From your local computer, enable the enhanced networking attribute using one of the following commands:

AWS CLI

[modify-instance-attribute](#) (AWS CLI/AWS CloudShell)

```
aws ec2 modify-instance-attribute --instance-id instance_id --srivnet-support simple
```

PowerShell

[Edit-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -SriovNetSupport "simple"
```

7. (Optional) Create an AMI from the instance, as described in [Create a custom Windows AMI](#). The AMI inherits the enhanced networking attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.
8. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: [start-instances](#) (AWS CLI), [Start-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.

Operating system optimizations

To achieve the maximum network performance on instances with enhanced networking, you might need to modify the default operating system configuration. We recommend the following configuration changes for applications that require high network performance. Other optimizations (such as turning on checksum offloading and enabling RSS, for example) are already in place on official Windows AMIs.

Note

TCP chimney offloading should be disabled in most use cases, and has been deprecated as of Windows Server 2016.

In addition to these operating system optimizations, you should also consider the maximum transmission unit (MTU) of your network traffic, and adjust according to your workload and network architecture. For more information, see [Network maximum transmission unit \(MTU\) for your EC2 instance](#).

AWS regularly measures average round trip latencies between instances launched in a cluster placement group of 50us and tail latencies of 200us at the 99.9 percentile. If your applications require consistently low latencies, we recommend using the latest version of the ENA drivers on fixed performance instances built on the Nitro System.

Configure RSS CPU affinity

Receive side scaling (RSS) is used to distribute network traffic CPU load across multiple processors. By default, the official Amazon Windows AMIs are configured with RSS enabled. ENA ENIs provide up to eight RSS queues. By defining CPU affinity for RSS queues, as well as for other system processes, it is possible to spread the CPU load out over multi-core systems, enabling more network traffic to be processed. On instance types with more than 16 vCPUs, we recommend you use the `Set-NetAdapterRSS` PowerShell cmdlet (available from Windows Server 2012 and later), which manually excludes the boot processor (logical processor 0 and 1 when hyper-threading is enabled) from the RSS configuration for all ENIs, in order to prevent contention with various system components.

Windows is hyper-thread aware and will ensure the RSS queues of a single NIC are always placed on different physical cores. Therefore, unless hyper-threading is disabled, in order to completely prevent contention with other NICs, spread the RSS configuration of each NIC among a range of 16 logical processors. The `Set-NetAdapterRss` cmdlet allows you to define the per-NIC range of valid logical processors by defining the values of `BaseProcessorGroup`, `BaseProcessorNumber`, `MaxProcessingGroup`, `MaxProcessorNumber`, and `NumaNode` (optional). If there are not enough physical cores to completely eliminate inter-NIC contention, minimize the overlapping ranges or reduce the number of logical processors in the ENI ranges depending on the expected workload of the ENI (in other words, a low volume admin network ENI may not need as many RSS queues

assigned). Also, as previously noted, various components must run on CPU 0, and therefore we recommend excluding it from all RSS configurations when sufficient vCPUs are available.

For example, when there are three ENIs on a 72 vCPU instance with 2 NUMA nodes with hyper-threading enabled, the following commands spread the network load between the two CPUs without overlap and prevent the use of core 0 completely.

```
Set-NetAdapterRss -Name NIC1 -BaseProcessorGroup 0 -BaseProcessorNumber 2 -  
MaxProcessorNumber 16  
Set-NetAdapterRss -Name NIC2 -BaseProcessorGroup 1 -BaseProcessorNumber 0 -  
MaxProcessorNumber 14  
Set-NetAdapterRss -Name NIC3 -BaseProcessorGroup 1 -BaseProcessorNumber 16 -  
MaxProcessorNumber 30
```

Note that these settings are persistent for each network adapter. If an instance is resized to one with a different number of vCPUs, you should reevaluate the RSS configuration for each enabled ENI. The complete Microsoft documentation for the `Set-NetAdapterRss` cmdlet can be found here: <https://docs.microsoft.com/en-us/powershell/module/netadapter/set-netadAPTERSS>.

Special note for SQL workloads: We also recommend that you review your I/O thread affinity settings along with your ENI RSS configuration to minimize I/O and network contention for the same CPUs. See [affinity mask Server Configuration Option](#).

Monitor network performance for your EC2 instance

The Elastic Network Adapter (ENA) driver publishes network performance metrics from the instances where they are enabled. You can use these metrics to troubleshoot instance performance issues, choose the right instance size for a workload, plan scaling activities proactively, and benchmark applications to determine whether they maximize the performance available on an instance.

Amazon EC2 defines network maximums at the instance level to ensure a high-quality networking experience, including consistent network performance across instance sizes. AWS provides maximums for the following for each instance:

- **Bandwidth capability** – Each EC2 instance has a maximum bandwidth for aggregate inbound and outbound traffic, based on instance type and size. Some instances use a network I/O credit mechanism to allocate network bandwidth based on average bandwidth utilization. Amazon EC2 also has maximum bandwidth for traffic to AWS Direct Connect and the internet. For more information, see [Amazon EC2 instance network bandwidth](#).

- **Packet-per-second (PPS) performance** – Each EC2 instance has a maximum PPS performance, based on instance type and size.
- **Connections tracked** – The security group tracks each connection established to ensure that return packets are delivered as expected. There is a maximum number of connections that can be tracked per instance. For more information, see [Security group connection tracking](#)
- **Link-local service access** – Amazon EC2 provides a maximum PPS per network interface for traffic to services such as the DNS service, the Instance Metadata Service, and the Amazon Time Sync Service.

When the network traffic for an instance exceeds a maximum, AWS shapes the traffic that exceeds the maximum by queueing and then dropping network packets. You can monitor when traffic exceeds a maximum using the network performance metrics. These metrics inform you, in real time, of impact to network traffic and possible network performance issues.

Contents

- [Requirements](#)
- [Metrics for the ENA driver](#)
- [View the network performance metrics for your Windows instance](#)

Requirements

- Install ENA driver version 2.2.2 or later. To verify the installed version, use Device Manager as follows.
 1. Open Device Manager by running devmgmt.msc.
 2. Expand **Network Adapters**.
 3. Choose **Amazon Elastic Network Adapter, Properties**.
 4. On the **Driver** tab, locate **Driver Version**.

To upgrade your ENA driver, see [Enhanced networking](#).

- To import these metrics to Amazon CloudWatch, install the CloudWatch agent. For more information, see [Collect advanced network metrics](#) in the *Amazon CloudWatch User Guide*.

Metrics for the ENA driver

The ENA driver delivers the following metrics to the instance in real time. They provide the cumulative number of packets queued or dropped on each network interface since the last driver reset.

Metric	Description	Supported on
bw_in_allowance_exceeded	The number of packets queued or dropped because the inbound aggregate bandwidth exceeded the maximum for the instance.	All instance types
bw_out_allowance_exceeded	The number of packets queued or dropped because the outbound aggregate bandwidth exceeded the maximum for the instance.	All instance types
conntrack_allowance_exceeded	The number of packets dropped because connection tracking exceeded the maximum for the instance and new connections could not be established. This can result in packet loss for traffic to or from the instance.	All instance types
conntrack_allowance_available	The number of tracked connections that can be established by the instance before hitting the Connections Tracked allowance of that instance type.	instances built on the AWS Nitro System only. Not supported with FreeBSD instances or DPDK environments.
linklocal_allowance_exceeded	The number of packets dropped because the PPS of the traffic to local proxy services exceeded the maximum for the network interface. This impacts traffic	All instance types

Metric	Description	Supported on
	to the DNS service, the Instance Metadata Service, and the Amazon Time Sync Service.	
pps_allowance_exceeded	The number of packets queued or dropped because the bidirectional PPS exceeded the maximum for the instance.	All instance types

View the network performance metrics for your Windows instance

You can view the metrics using any consumer of Windows performance counters. The data can be parsed according to the EnaPerfCounters manifest. This is an XML file that defines the performance counter provider and its countersets.

Manifest installation

If you launched the instance using an AMI that contains ENA driver 2.2.2 or later, or used the install script in the driver package for ENA driver 2.2.2, the manifest is already installed. To install the manifest manually, use the following steps:

1. Remove the existing manifest using the following command:

```
unlodctr /m:EnaPerfCounters.man
```

2. Copy the manifest file EnaPerfCounters.man from the driver installation package to %SystemRoot%\System32\drivers.
3. Install the new manifest using the following command:

```
lodctr /m:EnaPerfCounters.man
```

View metrics using Performance Monitor

1. Open Performance Monitor.
2. Press Ctrl+N to add new counters.

3. Choose **ENAs Packets Shaping** from the list.
4. Select the instances to monitor and choose **Add**.
5. Choose **OK**.

Troubleshoot the Elastic Network Adapter (ENA) Windows driver

The Elastic Network Adapter (ENA) is designed to improve operating system health and to reduce unexpected hardware behavior or failures that can disrupt the operation of your Windows instance. The ENA architecture keeps device or driver failures as transparent to the operating system as possible.

This topic provides troubleshooting information for the ENA Windows driver.

Can't connect

If you are unable to connect to your instance, see [Capture a screenshot of an unreachable instance](#).

 **Note**

You can also connect to the instance through AWS Systems Manager Session Manager. However, to do so requires prior configuration. For more information, see [Session Manager](#) in the *AWS Systems Manager User Guide*.

Collect diagnostic information on the instance

The steps to open Windows operating system (OS) tools vary, depending on what version of the OS is installed on your instance. In the following sections, we use the **Run** dialog to open the tools, which works the same across all OS versions. However, you can access these tools using any method that you prefer.

Access the Run dialog

- Using the Windows logo key combination: Windows + R
- Using the search bar:
 - Enter `run` in the search bar.
 - Select the **Run** application from the search results.

Some steps require the context menu to access properties or context-sensitive actions. There are several ways to do this, depending on your OS version and hardware.

Access the context menu

- Using your mouse: right-click an item to bring up its context menu.
- Using your keyboard:
 - Depending on your OS version, use Shift + F10, or Ctrl + Shift + F10.
 - If you have the context key on your keyboard (three horizontal lines in a box), select the item you want and then press the context key.

If you can connect to your instance, use the following techniques to gather diagnostic information for troubleshooting.

Check ENA device status

To check the status of your ENA Windows driver using the Windows Device Manager, follow these steps:

1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Device Manager, enter devmgmt.msc in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.
6. Verify that the message in the **General** tab says "This device is working properly."

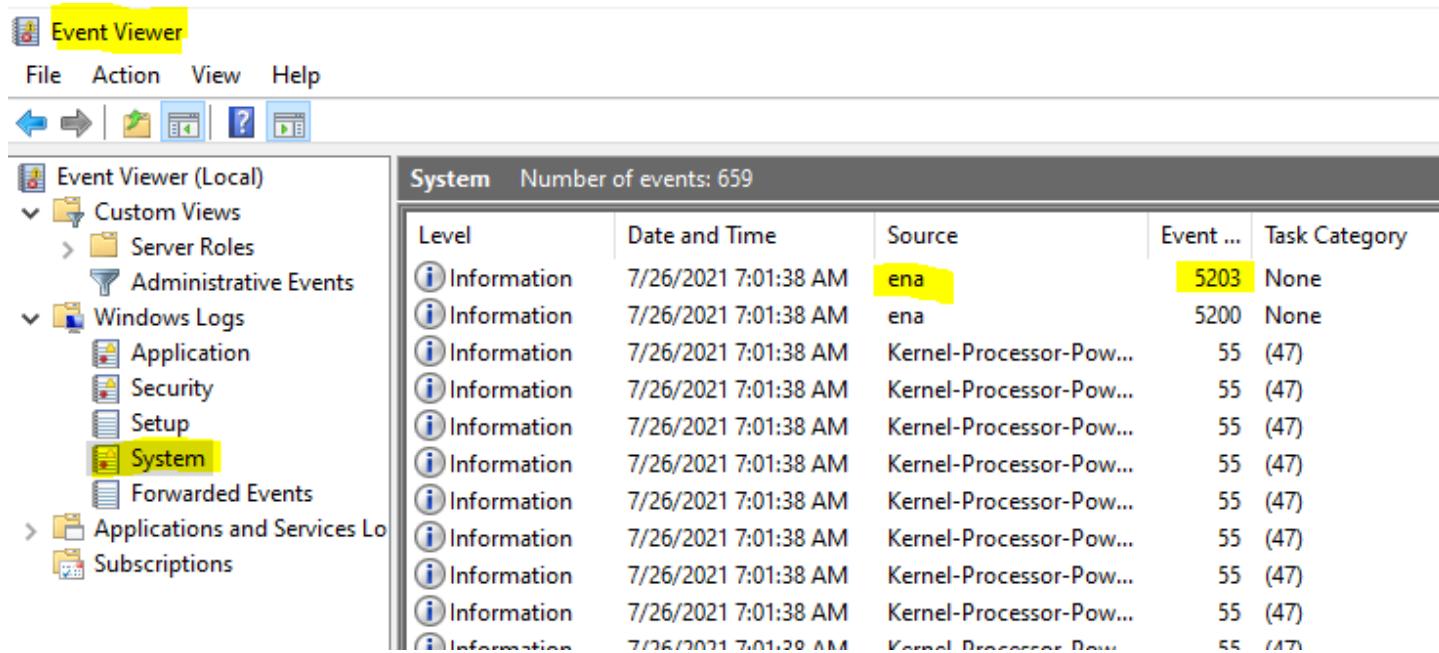

Investigate driver event messages

To review ENA Windows driver event logs using the Windows Event Viewer, follow these steps:

1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Event Viewer, enter eventvwr.msc in the **Run** box.
3. Choose **OK**. This opens the Event Viewer window.
4. Expand the **Windows Logs** menu, and then choose **System**.

5. Under **Actions**, in the top-right panel, choose **Filter Current Log**. This displays the filtering dialog.
 6. In the **Event sources** box, enter ena. This limits results to events that were generated by the ENA Windows driver.
 7. Choose **OK**. This shows filtered event log results in the detail sections of the window.
 8. To drill down into the details, select an event message from the list.

The following example shows an ENA driver event in the Windows Event Viewer system events list:

Event message summary

The following table shows event messages that the ENA Windows driver generates.

Input

Event ID	ENA driver event description	Type
5001	Hardware is out of resources	Error
5002	Adapter has detected a hardware error	Error

Event ID	ENa driver event description	Type
5005	Adapter has timed out on NDIS operation that did not complete in a timely manner	Error
5032	Adapter has failed to reset the device	Error
5200	Adapter has been initialized	Informational
5201	Adapter has been halted	Informational
5202	Adapter has been paused	Informational
5203	Adapter has been restarted	Informational
5204	Adapter has been shut down	Informational
5205	Adapter has been reset	Error
5206	Adapter has been surprise removed	Error
5208	Adapter initialization routine has failed	Error
5210	Adapter has encountered and successfully recovered an internal issue	Error

Review performance metrics

The ENA Windows driver publishes network performance metrics from the instances where metrics are enabled. You can view and enable metrics on the instance using the native Performance Monitor application. For more information about the metrics that the ENA Windows driver produces, see [Monitor network performance for your EC2 instance](#).

On instances where ENA metrics are enabled, and the Amazon CloudWatch agent is installed, CloudWatch collects the metrics that are associated with the counters in Windows Performance

Monitor, as well as some advanced metrics for ENA. These metrics are collected in addition to the metrics enabled by default on EC2 instances. For more information about the metrics, see [Metrics collected by the CloudWatch agent](#) in the *Amazon CloudWatch User Guide*.

Note

Performance metrics are available for ENA driver versions 2.4.0 and later (also for version 2.2.3). ENA driver version 2.2.4 was rolled back due to potential performance degradation on the sixth generation EC2 instances. We recommend that you upgrade to the current version of the driver to ensure that you have the latest updates.

Some of the ways that you can use performance metrics include:

- Troubleshoot instance performance issues.
- Choose the right instance size for a workload.
- Proactively plan scaling activities.
- Benchmark applications to determine if they maximize the performance available on an instance.

Refresh rate

By default, the driver refreshes metrics using a 1-second interval. However, the application that retrieves the metrics might use a different interval for polling. You can change the refresh interval in Device Manager, using the advanced properties for the driver.

To change the metrics refresh interval for the ENA Windows driver, follow these steps:

1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.
6. Open the **Advanced** tab in the pop-up window.
7. From the **Property** list, choose **Metrics Refresh Interval** to change the value.
8. When you are done, choose **OK**.

ENa adapter reset

The reset process starts when the ENA Windows driver detects an error on an adapter, and marks the adapter as unhealthy. The driver cannot reset itself, so it depends on the operating system to check the adapter health status, and call the reset handle for the ENA Windows driver. The reset process might result in a brief period of time where traffic loss occurs. However, TCP connections should be able to recover.

The ENA adapter might also indirectly request a device reset procedure, by failing to send a keep-alive notification. For example, if the ENA adapter reaches an unknown state after loading an irrecoverable configuration, it might stop sending keep-alive notifications.

Common causes for ENA adapter reset

- Keep-alive messages are missing

The ENA adapter posts keep-alive events at a fixed rate (usually once every second). The ENA Windows driver implements a watchdog mechanism, which periodically checks for the presence of these keep-alive messages. If it detects one or more new messages since the last time it checked, it records a successful outcome. Otherwise, the driver concludes that the device experienced a failure, and initiates a reset sequence.

- Packets are stuck in transmit queues

The ENA adapter verifies that packets are flowing through the transmit queues as expected. The ENA Windows driver detects if packets are getting stuck, and initiates a reset sequence if they are.

- Read timeout for Memory Mapped I/O (MMIO) registers

To limit memory mapped I/O (MMIO) read operations, the ENA Windows driver accesses MMIO registers only during initialization and reset processes. If the driver detects a timeout, it takes one of the following actions, depending on what process was running:

- If a timeout is detected during initialization, it fails the flow, which results in the driver displaying a yellow exclamation mark by the ENA adapter in Windows Device Manager.
- If a timeout is detected during reset, it fails the flow. The OS then initiates a surprise removal of the ENA adapter, and recovers it by stopping and starting the adapter that was removed. For more information about surprise removal of a network interface card (NIC), see [Handling the Surprise Removal of a NIC](#) in the *Microsoft Windows Hardware Developer* documentation.

Troubleshooting scenarios

The following scenarios can help you troubleshoot issues that you might experience with the ENA Windows driver. We recommend that you start with upgrading your ENA driver, if you don't have the latest version. To find the latest driver for your Windows OS version, see [Amazon ENA driver versions](#).

Unexpected ENA driver version installed

Description

After you go through the steps to install a specific version of the ENA driver, the Windows Device Manager shows that Windows installed a different version of the ENA driver.

Cause

When you run the install for a driver package, Windows ranks all of the driver packages that are valid for the given device in the local [Driver Store](#) before it begins. Then it selects the package with the lowest rank value as the best match. This can be different from the package that you intended to install. For more information about the device driver package selection process, see [How Windows selects a driver package for a device](#) on the *Microsoft documentation website*.

Solution

To ensure that Windows installs your chosen driver package version, you can remove lower ranked driver packages from the Driver Store with the [PnPUtil](#) command line tool.

Follow these steps to update the ENA driver:

1. Connect to your instance and log in as the local administrator.
2. Open the Device Manager properties window, as described in the [Check ENA device status](#) section. This opens the **General** tab of the **Amazon Elastic Network Adapter Properties** window.
3. Open the **Driver** tab.
4. Choose **Update Driver**. This opens the **Update Driver Software – Amazon Elastic Network Adapter** dialog box.
 - a. On the **How do you want to search for driver software?** page, choose **Browse my computer for driver software**.

- b. On the **Browse for driver software on your computer** page, choose **Let me pick from a list of device drivers on my computer**, located below the search bar.
 - c. On the **Select the device driver you want to install for this hardware** page, choose **Have Disk....**
 - d. In the **Install from Disk** window, choose **Browse...**, next to the file location from the dropdown list.
 - e. Navigate to the location where you downloaded the target ENA driver package. Select the file named **ena.inf** and choose **Open**.
 - f. To start the install, choose **OK**, and then choose **Next**.
5. If the installer doesn't automatically reboot your instance, run the **Restart-Computer** PowerShell cmdlet.

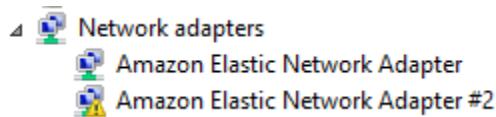

```
PS C:\> Restart-Computer
```

Device warning for ENA driver

Description

The ENA adapter icon in the Device Manager **Network adapters** section displays a warning sign (a yellow triangle with an exclamation mark inside).

The following example shows an ENA adapter with the warning icon in Windows Device Manager:

Cause

This device warning is commonly caused by environment issues, which might require more research, and often require a process of elimination to determine the underlying cause. For a full list of device errors, see [Device Manager Error Messages](#) in the *Microsoft Windows Hardware Developer* documentation.

Solution

The solution for this device warning depends on the root cause. The process of elimination described here includes a few basic steps to help identify and resolve the most common issues that

might have a simple solution. Additional root cause analysis is required when these steps do not resolve the issue.

Follow these steps to help identify and resolve common issues:

1. Stop and start the device

Open the Device Manager properties window, as described in the [Check ENA device status](#) section. This opens the **General** tab of the **Amazon Elastic Network Adapter Properties** window, where the **Device status** displays the error code and a short message.

- a. Open the **Driver** tab.
- b. Choose **Disable Device**, and respond **Yes** to the warning message that displays.
- c. Choose **Enable Device**.

2. Stop and start the EC2 instance

If the adapter still shows the warning icon in Device Manager, the next step is to stop and start the EC2 instance. This relaunches the instance on different hardware in most cases.

3. Investigate possible instance resource issue

If you have stopped and started your EC2 instance, and the problem persists, this might indicate a resource issue on your instance, such as insufficient memory.

Connection timeout with adapter reset (error codes 5007, 5205)

Description

The Windows Event Viewer shows adapter timeout and reset events occurring in combination for ENA adapters. Messages resemble the following examples:

- **Event ID 5007:** Amazon Elastic Network Adapter : Timed out during an operation.
- **Event ID 5205:** Amazon Elastic Network Adapter : Adapter reset has been started.

Adapter resets cause minimal traffic disruption. Even when there are multiple resets, it would be unusual for them to cause any severe network disruption.

Cause

This sequence of events indicates that the ENA Windows driver initiated a reset for an ENA adapter that was unresponsive. However, the mechanism that the device driver uses to detect this issue is subject to false positives resulting from CPU 0 starvation.

Solution

If this combination of errors happens frequently, check your resource allocations to see where adjustments might be helpful.

1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Resource Monitor, enter `resmon` in the **Run** box.
3. Choose **OK**. This opens the Resource Monitor window.
4. Open the **CPU** tab. Per-CPU usage graphs are shown along the right side of the Resource Monitor window.
5. Check the usage levels for CPU 0 to see if they are too high.

We recommend that you configure RSS to exclude CPU 0 for the ENA adapter on larger instance types (more than 16 vCPU). For smaller instance types, configuring RSS might improve the experience, but due to the lower number of available cores, testing is necessary to ensure that constraining CPU cores does not negatively impact performance.

Use the **Set-NetAdapterRss** command to configure RSS for your ENA adapter, as shown in the following example.

```
Set-NetAdapterRss -name (Get-NetAdapter | Where-Object {$_.InterfaceDescription -like "*Elastic*"}).Name -Baseprocessorgroup 0 -BaseProcessorNumber 1
```

Migrating to a sixth generation instance infrastructure impacts performance or attachment

Description

If you migrate to a sixth generation EC2 instance, you might experience reduced performance or ENA attachment failures if you haven't updated your ENA Windows driver version.

Cause

The sixth generation EC2 instance types require the following minimum version of the ENA Windows driver, based on the instance operating system (OS).

Minimum version

Windows Server version	ENa driver version
Windows Server 2008 R2	2.2.3 or 2.4.0
Windows Server 2012 and later	2.2.3 and later
Windows Workstation	2.2.3 and later

Solution

Before you upgrade to a sixth generation EC2 instance, make sure that the AMI you launch from has compatible drivers based on the instance OS as shown in the previous table. For more information, see [What do I need to do before migrating my EC2 instance to a sixth generation instance to make sure that I get maximum network performance?](#) in the AWS *re:Post Knowledge Center*.

Suboptimal performance for the elastic network interface

Description

The ENA interface is not performing as expected.

Cause

Root cause analysis for performance issues is a process of elimination. There are too many variables involved to name a common cause.

Solution

The first step in your root cause analysis is to review the diagnostic information for the instance that is not performing as expected, to determine if there are errors that might be causing the issue. For more information, see the [Collect diagnostic information on the instance](#) section.

You might need to modify the default operating system configuration to achieve maximum network performance on instances with enhanced networking. Some optimizations, such as turning on checksum offloading and enabling RSS, are configured by default in official Windows AMIs.

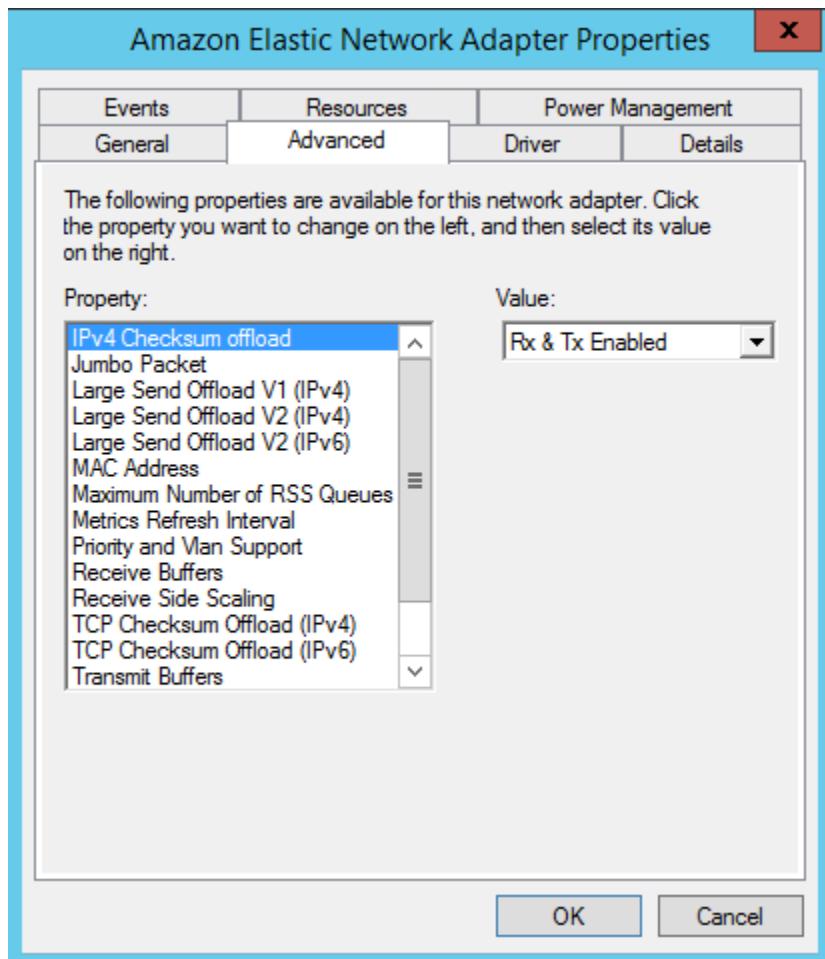

For other optimizations that you can apply to the ENA adapter, see the performance adjustments shown in [ENa adapter performance adjustments](#).

We recommend that you proceed with caution, and limit device property adjustments to those that are listed in this section, or to specific changes that are recommended by the AWS support team.

To change ENA adapter properties, follow these steps:

1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.
6. To make your changes, open the **Advanced** tab.
7. When you're done, choose **OK** to save your changes.

The following example shows an ENA adapter property in the Windows Device Manager:

ENa adapter performance adjustments

The following table includes properties that can be adjusted to improve performance for the ENA interface.

Input

Property	Description	Default value	Adjustment
Receive Buffers	Controls the number of entries in the software receive queues.	1024	Can be increased up to a maximum of 8192.
Receive Side Scaling (RSS)	Enables the efficient distribution of	Enabled	You can spread the load across multiple

Property	Description	Default value	Adjustment
	network receive processing across multiple CPUs in multiprocessor systems.		processors. To learn more, see Operating system optimizations .

Property	Description	Default value	Adjustment
Maximum Number of RSS Queues	Sets the maximum number of RSS queues allowed when RSS is enabled.	32	<p>The number of RSS queues is determined during driver initialization, and includes the following limitations (among others):</p> <ul style="list-style-type: none"> • RSS queue limit set by this property • Instance limits (vCPU count) • Hardware generation limits (up to 8 RSS queues in ENAv1, and up to 32 RSS queues in ENAv2) <p>You can set the value from 1-32, depending on your instance and hardware generation limits. To learn more, see Operating system optimizations.</p>

Property	Description	Default value	Adjustment
Jumbo packet	Enables the use of jumbo ethernet frames (more than 1500 bytes of payload).	Disabled (this limits payload to 1500 bytes or less)	Value can be set up to 9015, which translates to 9001 bytes of payload. This is the maximum payload for jumbo ethernet frames. See Considerations for using jumbo ethernet frames .

Considerations for using jumbo ethernet frames

Jumbo frames allow more than 1500 bytes of data by increasing the payload size per packet, which increases the percentage of the packet that is not packet overhead. Fewer packets are needed to send the same amount of usable data. However, traffic is limited to a maximum MTU of 1500 in the following cases:

- Traffic outside of a given AWS Region for EC2 Classic.
- Traffic outside of a single VPC.
- Traffic over an inter-Region VPC peering connection.
- Traffic over VPN connections.
- Traffic over an internet gateway.

Note

Packets over 1500 bytes are fragmented. If you have the Don't Fragment flag set in the IP header, these packets are dropped.

Jumbo frames should be used with caution for internet-bound traffic, or any traffic that leaves a VPC. Packets are fragmented by intermediate systems, which slows down this traffic. To use jumbo frames inside of a VPC without impacting outbound traffic that's leaving the VPC, try one of the following options:

- Configure the MTU size by route.
- Use multiple network interfaces with different MTU sizes and different routes.

Recommended use cases for jumbo frames

Jumbo frames can be useful for traffic inside of and between VPCs. We recommend using jumbo frames for the following use cases:

- For instances that are collocated inside of a cluster placement group, jumbo frames help to achieve the maximum network throughput possible. For more information, see [Placement groups](#).
- You can use jumbo frames for traffic between your VPCs and your on-premises networks over AWS Direct Connect. For more information about using AWS Direct Connect, and verifying jumbo frame capability, see [Set network MTU for private virtual interfaces or transit virtual interfaces](#) in the *AWS Direct Connect User Guide*.
- For more information about supported MTU sizes for transit gateways, see [Quotas for your transit gateways](#) in the *Amazon VPC Transit Gateways*.

Amazon EC2 instance topology

Describing your instance topology provides a hierarchical view of the relative proximity between instances. You can use this information to manage high performance computing (HPC) and machine learning (ML) compute infrastructure at scale, while optimizing job placement. HPC and ML jobs are sensitive to latency and throughput. You can use the instance topology to detect the location of your instances, and then use this information to optimize HPC and ML jobs by running them on instances that are physically closer to each other.

You can use instance topology to detect the location of your existing instances, but you can't use it to choose to launch a new instance physically close to an existing instance. To influence instance placement, you can use [Capacity Reservations in cluster placement groups](#).

Pricing

There is no additional cost to describe your instance topology.

Contents

How instance topology works

Every EC2 instance connects to a node set. A node set comprises three network nodes, with each node representing a different layer in the AWS network. The network layers are arranged in a hierarchy of 3 or more layers. The node set provides the top-down view of this hierarchy, with the bottom layer connected closest to an instance.

The information about the node set is called the *instance topology*.

The following diagram provides a visual representation that you can use to understand the instance topology. The network nodes are identified as **NN1 – NN7**. The numerals **i**, **ii**, and **iii** identify the network layers. The numbers **1**, **2**, **3**, and **4** identify the EC2 instances. Instances connect to a node in the bottom layer, identified by **iii**. More than one instance can connect to the same node.

In this example:

- Instance 1 connects to network node 4 (NN4) in layer iii. NN4 connects to network node 2 (NN2) in layer ii, and NN2 connects to network node 1 (NN1) in layer i, which is the top of the network hierarchy in this example. The network node set comprises NN1, NN2, and NN4, expressed hierarchically from the upper layers to the bottom layer.
- Instance 2 also connects to network node 4 (NN4). Instance 1 and instance 2 share the same network node set: NN1, NN2, and NN4.
- Instance 3 connects to network node 5 (NN5). NN5 connects to NN2, and NN2 connects to NN1. The network node set for instance 3 is NN1, NN2, and NN5.
- Instance 4 connects to network node 6 (NN6). Its network node set is NN1, NN3, and NN6.

When considering the proximity of instances 1, 2, and 3, instances 1 and 2 are closer to each other because they connect to the same network node (NN4), while instance 3 is further away because it connects to a different network node (NN5).

When considering the proximity of all the instances in this diagram, instances 1, 2, and 3 are closer to each other than they are to instance 4 because they share NN2 in their network node set.

As a general rule, if the network node connected to any two instances is the same, these instances are physically close to each other, as is the case with instances 1 and 2. Furthermore, the fewer the number of hops between network nodes, the closer the instances are to each other. For example, instances 1 and 3 have fewer hops to a common network node (NN2) than they have to the network node (NN1) they have in common with instance 4, and are therefore closer to each other than they are to instance 4.

There are no instances running under network node 7 (NN7) in this example, and therefore the API output won't include NN7.

How to interpret the output

You get the instance topology information using the [DescribeInstanceTopology](#) API. The output provides a hierarchical view of the underlying network topology for an instance.

The following example output corresponds to the network topology information of the four instances in the preceding diagram. Comments are included in the example output for the purposes of this example.

The following information in the output is important to note:

- NetworkNodes describes the network node set of an instance.
- In each network node set, the network nodes are listed in hierarchical order from top to bottom.
- The network node that is connected to the instance is the last network node in the list (the bottom layer).
- To work out which instances are close to each other, first find common network nodes in the bottom layer. If there are no common network nodes in the bottom layer, then find common network nodes in the upper layers.

In the following example output, i-111111111example and i-222222222example are located closest to each other compared to the other instances in this example because they have the network node nn-444444444example in common in the bottom layer.

```
{  
    "Instances": [  
        {
```

```

}
```

Limitations

The following limitations apply:

- The instances must be in the `running` state.
- Each instance topology view is unique per account.
- The AWS Management Console does not support viewing the instance topology.

Prerequisites for instance topology

Before you describe the instance topology for your instances, ensure that your instances meet the following requirements.

Requirements to describe the topology of your instances

- [AWS Regions](#)
- [Instance types](#)
- [Instance state](#)

AWS Regions

Supported AWS Regions:

- US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon)
- Asia Pacific (Seoul), Asia Pacific (Tokyo)
- Canada (Central)
- Europe (Frankfurt), Europe (Ireland), Europe (Stockholm)

Instance types

Supported instance types:

- hpc6a.48xlarge | hpc6id.32xlarge | hpc7a.12xlarge | hpc7a.24xlarge | hpc7a.48xlarge | hpc7a.96xlarge | hpc7g.4xlarge | hpc7g.8xlarge | hpc7g.16xlarge
- p3dn.24xlarge | p4d.24xlarge | p4de.24xlarge | p5.48xlarge
- trn1.2xlarge | trn1.32xlarge | trn1n.32xlarge

To see the available instance types in a specific Region

The available instance types vary by Region. To see if an instance type is available in a Region, use the [describe-instance-types-offerings](#) command with the --region parameter. Include the --filters parameter to scope the results to the instance family or instance type that you're interested in and the --query parameter to scope the output to the value of InstanceType.

```
aws ec2 describe-instance-type-offerings \
  --region us-east-2 \
  --filters 'Name=instance-type, Values=trn1*' \
  --query 'InstanceTypeOfferings[].InstanceType'
```

Expected output

```
[  
  "trn1.2xlarge",  
  "trn1.32xlarge",  
  "trn1n.32xlarge"  
]
```

Instance state

Instances must be in the running state. You can't get instance topology information for instances that are in another state.

Amazon EC2 instance topology examples

You can use the [describe-instance-topology](#) CLI command to describe the instance topology for your EC2 instances.

When you use the `describe-instance-topology` command without parameters or filters, the response includes all your instances that match the supported instance types for this command in the specified Region. You can specify the Region by including the `--region` parameter, or by setting a default Region. For more information about setting a default Region, see [Specify the Region for a resource](#).

You can include parameters to return instances that match specified instance IDs or placement group names. You can also include filters to return instances that match a specified instance type or instance family, or instances in a specified Availability Zone or Local Zone. You can include a single parameter or filter, or a combination of parameters and filters.

The output is paginated, with up to 20 instances per page by default. You can specify up to 100 instances per page using the `--max-results` parameter.

For more information, see [describe-instance-topology](#) in the *AWS CLI Command Reference*.

Require permissions

The following permission is required to describe instance topology:

- `ec2:DescribeInstanceTopology`

Examples

- [Example 1 - No parameters or filters](#)
- [Example 2 – instance-type filter](#)
 - [Example 2a – Exact match filter for a specified instance type](#)
 - [Example 2b – Wild card filter for an instance family](#)
 - [Example 2c – Combined instance family and exact match filters](#)
- [Example 3 – zone-id filter](#)
 - [Example 3a – Availability Zone filter](#)
 - [Example 3b – Local Zone filter](#)
 - [Example 3c – Combined Availability Zone and Local Zone filters](#)
- [Example 4 – Combined instance-type and zone-id filters](#)
- [Example 5 – Placement group name parameter](#)
- [Example 6 – Instance IDs](#)

Example 1 - No parameters or filters

To describe the instance topology of all your instances

Use the [describe-instance-topology](#) CLI command without specifying any parameters or filters.

```
aws ec2 describe-instance-topology --region us-west-2
```

The response returns only the instances that match the supported instance types for this API. The instances can be in different Availability Zones, Local Zones (ZoneId), and placement groups (GroupName). If an instance is not in a placement group, the GroupName field does not appear in the output. In the following example output, only one instance is in a placement group.

Example output

```
{
    "Instances": [
        {
            "InstanceId": "i-1111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "my-ml-cpg",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "p4d.24xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-3333333333example",
            "InstanceType": "trn1.32xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        }
    ]
}
```

```
    "NetworkNodes": [
        "nn-1212121212example",
        "nn-1211122211example",
        "nn-1311133311example"
    ],
    "ZoneId": "usw2-az4",
    "AvailabilityZone": "us-west-2d"
},
{
    "InstanceId": "i-444444444example",
    "InstanceType": "trn1.2xlarge",
    "NetworkNodes": [
        "nn-1111111111example",
        "nn-5434334334example",
        "nn-1235301234example"
    ],
    "ZoneId": "usw2-az2",
    "AvailabilityZone": "us-west-2a"
}
],
"NextToken": "SomeEncryptedToken"
}
```

Example 2 – instance-type filter

You can filter by a specified instance type (exact match) or filter by an instance family (using a wildcard). You can also combine a specified instance type filter and instance family filter.

Example 2a – Exact match filter for a specified instance type

To describe the instance topology of all your instances that match a specified instance type

Use the [describe-instance-topology](#) CLI command with the instance-type filter. In this example, the output is filtered for `trn1n.32xlarge` instances. The response will return only the instances that match the specified instance type.

```
aws ec2 describe-instance-topology \
--region us-west-2 \
--filters Name=instance-type,Values=trn1n.32xlarge
```

Example output

{

```
"Instances": [
    {
        "InstanceId": "i-22222222example",
        "InstanceType": "trn1n.32xlarge",
        "NetworkNodes": [
            "nn-11111111example",
            "nn-22222222example",
            "nn-33333333example"
        ],
        "ZoneId": "usw2-az2",
        "AvailabilityZone": "us-west-2a"
    }
],
"NextToken": "SomeEncryptedToken"
}
```

Example 2b – Wild card filter for an instance family

To describe the instance topology of all your instances that match an instance family

Use the [describe-instance-topology](#) CLI command with the instance-type filter. In this example, the output is filtered for `trn1*` instances. The response will return only the instances that match the specified instance family.

```
aws ec2 describe-instance-topology \
--region us-west-2 \
--filters Name=instance-type,Values="trn1*"
```

Example output

```
{
    "Instances": [
        {
            "InstanceId": "i-22222222example",
            "InstanceType": "trn1n.32xlarge",
            "NetworkNodes": [
                "nn-11111111example",
                "nn-22222222example",
                "nn-33333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
    ]
},
```

```
{  
    "InstanceId": "i-3333333333example",  
    "InstanceType": "trn1.32xlarge",  
    "NetworkNodes": [  
        "nn-1212121212example",  
        "nn-1211122211example",  
        "nn-1311133311example"  
    ],  
    "ZoneId": "usw2-az4",  
    "AvailabilityZone": "us-west-2d"  
},  
{  
    "InstanceId": "i-44444444example",  
    "InstanceType": "trn1.2xlarge",  
    "NetworkNodes": [  
        "nn-1111111111example",  
        "nn-5434334334example",  
        "nn-1235301234example"  
    ],  
    "ZoneId": "usw2-az2",  
    "AvailabilityZone": "us-west-2a"  
}  
,  
"NextToken": "SomeEncryptedToken"  
}
```

Example 2c – Combined instance family and exact match filters

To describe the instance topology of all your instances that match an instance family or specified instance type

Use the [describe-instance-topology](#) CLI command with the instance-type filter. In this example, the output is filtered for pd4d* or trn1n.32xlarge instances. The response will return the instances that match any of the specified filters.

```
aws ec2 describe-instance-topology \  
--region us-west-2 \  
--filters "Name=instance-type,Values=pd4d*,trn1n.32xlarge"
```

Example output

```
{  
    "Instances": [  
        {  
            "InstanceId": "i-3333333333example",  
            "InstanceType": "trn1.32xlarge",  
            "NetworkNodes": [  
                "nn-1212121212example",  
                "nn-1211122211example",  
                "nn-1311133311example"  
            ],  
            "ZoneId": "usw2-az4",  
            "AvailabilityZone": "us-west-2d"  
        },  
        {  
            "InstanceId": "i-44444444example",  
            "InstanceType": "trn1.2xlarge",  
            "NetworkNodes": [  
                "nn-1111111111example",  
                "nn-5434334334example",  
                "nn-1235301234example"  
            ],  
            "ZoneId": "usw2-az2",  
            "AvailabilityZone": "us-west-2a"  
        }  
    ]  
}
```

```
{  
    "InstanceId": "i-1111111111example",  
    "InstanceType": "p4d.24xlarge",  
    "GroupName": "ML-group",  
    "NetworkNodes": [  
        "nn-1111111111example",  
        "nn-2222222222example",  
        "nn-3333333333example"  
    ],  
    "ZoneId": "usw2-az2",  
    "AvailabilityZone": "us-west-2a"  
},  
{  
    "InstanceId": "i-2222222222example",  
    "InstanceType": "trn1n.32xlarge",  
    "NetworkNodes": [  
        "nn-1111111111example",  
        "nn-2222222222example",  
        "nn-4343434343example"  
    ],  
    "ZoneId": "usw2-az2",  
    "AvailabilityZone": "us-west-2a"  
}  
],  
"NextToken": "SomeEncryptedToken"  
}
```

Example 3 – zone-id filter

You can use the `zone-id` filter to filter by an Availability Zone or Local Zone. You can also combine an Availability Zone filter and Local Zone filter.

Example 3a – Availability Zone filter

To describe the instance topology of all your instances that match a specified Availability Zone

Use the [describe-instance-topology](#) CLI command with the `zone-id` filter. In this example, the output is filtered for the `us-west-2a` Availability Zone. The response will return only the instances that match the specified Availability Zone.

```
aws ec2 describe-instance-topology \  
--region us-west-2 \  
--filters Name=zone-id,Values="us-west-2a"
```

Example output

```
{  
    "Instances": [  
        {  
            "InstanceId": "i-222222222example",  
            "InstanceType": "trn1n.32xlarge",  
            "NetworkNodes": [  
                "nn-111111111example",  
                "nn-222222222example",  
                "nn-3214313214example"  
            ],  
            "ZoneId": "usw2-az2",  
            "AvailabilityZone": "us-west-2a"  
        }  
    ],  
    "NextToken": "SomeEncryptedToken"  
}
```

Example 3b – Local Zone filter

To describe the instance topology of all your instances that match a specified Local Zone

Use the [describe-instance-topology](#) CLI command with the zone-id filter. In this example, the output is filtered for the usw2-az2 Local Zone. The response will return only the instances that match the specified Local Zone.

```
aws ec2 describe-instance-topology \  
  --region us-west-2 \  
  --filters Name=zone-id,Values=usw2-az2
```

Example output

```
{  
    "Instances": [  
        {  
            "InstanceId": "i-111111111example",  
            "InstanceType": "p4d.24xlarge",  
            "GroupName": "ML-group",  
            "NetworkNodes": [  
                "nn-111111111example",  
                "nn-222222222example",  
                "nn-333333333example"  
            ]  
        }  
    ]  
}
```

```
        ],
        "ZoneId": "usw2-az2",
        "AvailabilityZone": "us-west-2a"
    }
],
"NextToken": "SomeEncryptedToken"
}
```

Example 3c – Combined Availability Zone and Local Zone filters

To describe the instance topology of all your instances that match a specified Availability Zone or Local Zone

Use the [describe-instance-topology](#) CLI command with the zone-id filter. In this example, the output is filtered for the us-west-2a Availability Zone and usw2-az2 Local Zone. The response will return the instances that match any of the specified filters.

```
aws ec2 describe-instance-topology \
--region us-west-2 \
--filters "Name=zone-id,Values=us-west-2a,usw2-az2"
```

Example output

```
{
    "Instances": [
        {
            "InstanceId": "i-111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "ML-group",
            "NetworkNodes": [
                "nn-111111111example",
                "nn-222222222example",
                "nn-333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-222222222example",
            "InstanceType": "trn1n.32xlarge",
            "NetworkNodes": [
                "nn-111111111example",
                "nn-222222222example",
                "nn-333333333example"
            ]
        }
    ]
}
```

```
        "nn-3214313214example"
    ],
    "ZoneId": "usw2-az2",
    "AvailabilityZone": "us-west-2a"
}
],
"NextToken": "SomeEncryptedToken"
}
```

Example 4 – Combined instance-type and zone-id filters

You can combine all the filters in a single command.

To describe the instance topology of all your instances that match a specified instance type, instance family, Availability Zone, or Local Zone

Use the [describe-instance-topology](#) CLI command with the instance-type and zone-id filters.

In this example, the output is filtered for the p4d* instance family, trn1n.32xlarge instance type, us-west-2a Availability Zone, and usw2-az2 Local Zone. The response will return the instances that match p4d* or trn1n.32xlarge instances in the us-west-2a or usw2-az2 zones.

```
aws ec2 describe-instance-topology \
--region us-west-2 \
--filters "Name=instance-type,Values=p4d*,trn1n.32xlarge" "Name=zone-id,Values=us-
west-2a,usw2-az2"
```

Example output

```
{
    "Instances": [
        {
            "InstanceId": "i-1111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "ML-group",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
    ]
```

```
{  
    "InstanceId": "i-2222222222example",  
    "InstanceType": "trn1n.32xlarge",  
    "NetworkNodes": [  
        "nn-1111111111example",  
        "nn-2222222222example",  
        "nn-3214313214example"  
    ],  
    "ZoneId": "usw2-az2",  
    "AvailabilityZone": "us-west-2a"  
}  
,  
"NextToken": "SomeEncryptedToken"  
}
```

Example 5 – Placement group name parameter

To describe the instance topology of all your instances in a specified placement group

Use the [describe-instance-topology](#) CLI command with the group-names parameter. In the following example, the instances can be in the ML-group or HPC-group placement group. The response will return instances that are in either of the placement groups.

```
aws ec2 describe-instance-topology \  
--region us-west-2 \  
--group-names ML-group HPC-group
```

Example output

```
{  
    "Instances": [  
        {  
            "InstanceId": "i-1111111111example",  
            "InstanceType": "p4d.24xlarge",  
            "GroupName": "ML-group",  
            "NetworkNodes": [  
                "nn-1111111111example",  
                "nn-2222222222example",  
                "nn-3333333333example"  
            ],  
            "ZoneId": "usw2-az2",  
            "AvailabilityZone": "us-west-2a"  
        },  
        ...  
    ]  
}
```

```
{  
    "InstanceId": "i-222222222example",  
    "InstanceType": "trn1n.32xlarge",  
    "GroupName": "HPC-group",  
    "NetworkNodes": [  
        "nn-111111111example",  
        "nn-222222222example",  
        "nn-3214313214example"  
    ],  
    "ZoneId": "usw2-az2",  
    "AvailabilityZone": "us-west-2a"  
}  
,  
"NextToken": "SomeEncryptedToken"  
}
```

Example 6 – Instance IDs

To describe the instance topology of specified instances

Use the [describe-instance-topology](#) CLI command with the `--instance-ids` parameter. The response will return the instances that match the specified instance IDs.

```
aws ec2 describe-instance-topology \  
--region us-west-2 \  
--instance-ids i-111111111example i-222222222example
```

Example output

```
{  
    "Instances": [  
        {  
            "InstanceId": "i-111111111example",  
            "InstanceType": "p4d.24xlarge",  
            "GroupName": "ML-group",  
            "NetworkNodes": [  
                "nn-111111111example",  
                "nn-222222222example",  
                "nn-333333333example"  
            ],  
            "ZoneId": "usw2-az2",  
            "AvailabilityZone": "us-west-2a"  
        },  
    ]  
}
```

```
{  
    "InstanceId": "i-2222222222example",  
    "InstanceType": "trn1n.32xlarge",  
    "GroupName": "HPC-group",  
    "NetworkNodes": [  
        "nn-1111111111example",  
        "nn-2222222222example",  
        "nn-3214313214example"  
    ],  
    "ZoneId": "usw2-az2",  
    "AvailabilityZone": "us-west-2a"  
}  
,  
"NextToken": "SomeEncryptedToken"  
}
```

Placement groups

To meet the needs of your workload, you can launch a group of *interdependent* EC2 instances into a *placement group* to influence their placement.

Depending on the type of workload, you can create a placement group using one of the following placement strategies:

- **Cluster** – Packs instances close together inside an Availability Zone. This strategy enables workloads to achieve the low-latency network performance necessary for tightly-coupled node-to-node communication that is typical of high-performance computing (HPC) applications.
- **Partition** – Spreads your instances across logical partitions such that groups of instances in one partition do not share the underlying hardware with groups of instances in different partitions. This strategy is typically used by large distributed and replicated workloads, such as Hadoop, Cassandra, and Kafka.
- **Spread** – Strictly places a small group of instances across distinct underlying hardware to reduce correlated failures.

Placement groups are optional. If you don't launch your instances into a placement group, EC2 tries to place the instances in such a way that all of your instances are spread out across the underlying hardware to minimize correlated failures.

There is no charge for creating a placement group.

Placement strategies

You can create a placement group using one of the following placement strategies.

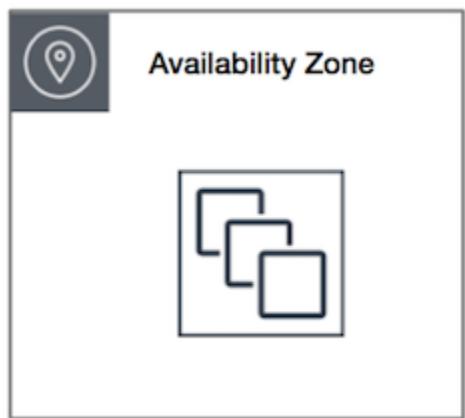

Placement strategies:

- [Cluster placement groups](#)
- [Partition placement groups](#)
- [Spread placement groups](#)

Cluster placement groups

A cluster placement group is a logical grouping of instances within a single Availability Zone. A cluster placement group can span peered virtual private networks (VPCs) in the same Region. Instances in the same cluster placement group enjoy a higher per-flow throughput limit for TCP/IP traffic and are placed in the same high-bisection bandwidth segment of the network.

The following image shows instances that are placed into a cluster placement group.

Cluster placement groups are recommended for applications that benefit from low network latency, high network throughput, or both. They are also recommended when the majority of the network traffic is between the instances in the group. To provide the lowest latency and the highest packet-per-second network performance for your placement group, choose an instance type that supports enhanced networking. For more information, see [Enhanced Networking](#).

We recommend that you launch your instances in the following way:

- Use a single launch request to launch the number of instances that you need in the placement group.

- Use the same instance type for all instances in the placement group.

If you try to add more instances to the placement group later, or if you try to launch more than one instance type in the placement group, you increase your chances of getting an insufficient capacity error.

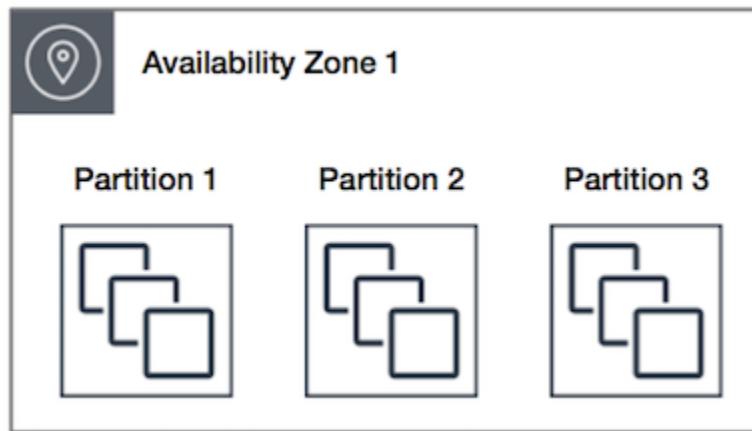

If you stop an instance in a placement group and then start it again, it still runs in the placement group. However, the start fails if there isn't enough capacity for the instance.

If you receive a capacity error when launching an instance in a placement group that already has running instances, stop and start all of the instances in the placement group, and try the launch again. Starting the instances may migrate them to hardware that has capacity for all of the requested instances.

Partition placement groups

Partition placement groups help reduce the likelihood of correlated hardware failures for your application. When using partition placement groups, Amazon EC2 divides each group into logical segments called partitions. Amazon EC2 ensures that each partition within a placement group has its own set of racks. Each rack has its own network and power source. No two partitions within a placement group share the same racks, allowing you to isolate the impact of hardware failure within your application.

The following image is a simple visual representation of a partition placement group in a single Availability Zone. It shows instances that are placed into a partition placement group with three partitions—**Partition 1**, **Partition 2**, and **Partition 3**. Each partition comprises multiple instances. The instances in a partition do not share racks with the instances in the other partitions, allowing you to contain the impact of a single hardware failure to only the associated partition.

Partition placement groups can be used to deploy large distributed and replicated workloads, such as HDFS, HBase, and Cassandra, across distinct racks. When you launch instances into a partition placement group, Amazon EC2 tries to distribute the instances evenly across the number of partitions that you specify. You can also launch instances into a specific partition to have more control over where the instances are placed.

A partition placement group can have partitions in multiple Availability Zones in the same Region. A partition placement group can have a maximum of seven partitions per Availability Zone. The number of instances that can be launched into a partition placement group is limited only by the limits of your account.

In addition, partition placement groups offer visibility into the partitions — you can see which instances are in which partitions. You can share this information with topology-aware applications, such as HDFS, HBase, and Cassandra. These applications use this information to make intelligent data replication decisions for increasing data availability and durability.

If you start or launch an instance in a partition placement group and there is insufficient unique hardware to fulfill the request, the request fails. Amazon EC2 makes more distinct hardware available over time, so you can try your request again later.

Spread placement groups

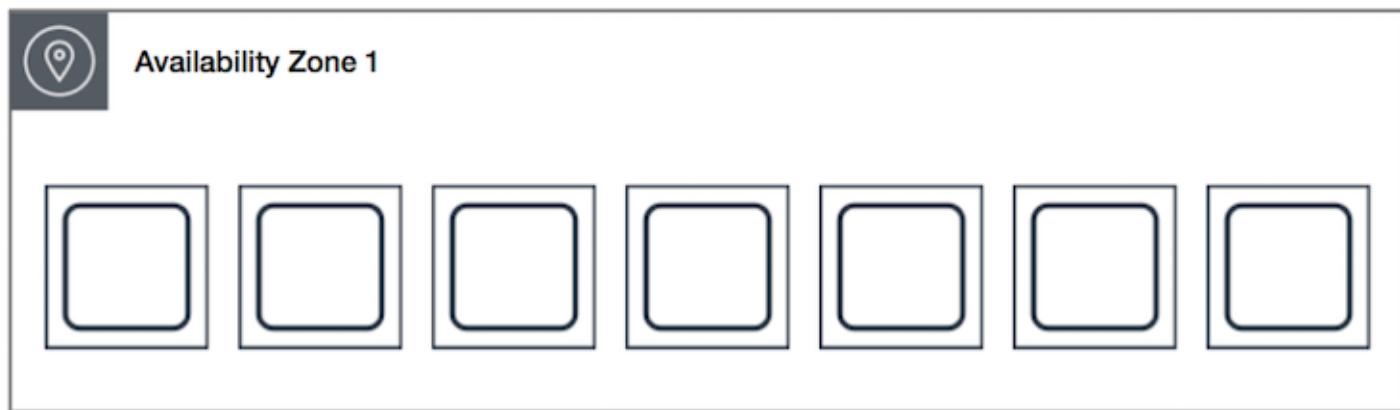

A spread placement group is a group of instances that are each placed on distinct hardware.

Spread placement groups are recommended for applications that have a small number of critical instances that should be kept separate from each other. Launching instances in a spread level placement group reduces the risk of simultaneous failures that might occur when instances share the same equipment. Spread level placement groups provide access to distinct hardware, and are therefore suitable for mixing instance types or launching instances over time.

If you start or launch an instance in a spread placement group and there is insufficient unique hardware to fulfill the request, the request fails. Amazon EC2 makes more distinct hardware available over time, so you can try your request again later. Placement groups can spread instances across racks or hosts. Rack level spread placement groups can be used in AWS Regions and on AWS Outposts. Host level spread placement groups can be used with AWS Outposts only.

Rack level spread placement groups

The following image shows seven instances in a single Availability Zone that are placed into a spread placement group. The seven instances are placed on seven different racks, each rack has its own network and power source.

A rack level spread placement group can span multiple Availability Zones in the same Region. In a Region, a rack level spread placement group can have a maximum of seven running instances per Availability Zone per group. With Outposts, a rack level spread placement group can hold as many instances as you have racks in your Outpost deployment.

Host level spread placement groups

Host level spread placement groups are only available with AWS Outposts. A host spread level placement group can hold as many instances as you have hosts in your Outpost deployment. For more information, see [the section called “Placement groups on AWS Outposts”](#).

Placement group rules and limitations

Topics

- [General rules and limitations](#)
- [Cluster placement group rules and limitations](#)
- [Partition placement group rules and limitations](#)
- [Spread placement group rules and limitations](#)

General rules and limitations

Before you use placement groups, be aware of the following rules:

- You can create a maximum of 500 placement groups per account in each Region.
- The name that you specify for a placement group must be unique within your AWS account for the Region.

- You can't merge placement groups.
- An instance can be launched in one placement group at a time; it cannot span multiple placement groups.
- [On-Demand Capacity Reservations](#) and [zonal Reserved Instances](#) allow you to reserve capacity for EC2 instances in Availability Zones. When you launch an instance, if the instance attributes match those specified by an On-Demand Capacity Reservation or a zonal Reserved Instance, then the reserved capacity is automatically used by the instance. This is also true if you launch the instance into a placement group.

If you plan to launch instances into a *cluster* placement group, we recommend that you reserve capacity explicitly in the cluster placement group. You can do this by creating an [On-Demand Capacity Reservation in a specified cluster placement group](#). Note that while you can reserve capacity in this way using On-Demand Capacity Reservations, the same can't be done with zonal Reserved Instances as they can't reserve capacity explicitly in a placement group.

- You can't launch Dedicated Hosts in placement groups.
- You can't launch a Spot Instance that is configured to stop or hibernate on interruption in a placement group.

Cluster placement group rules and limitations

The following rules apply to cluster placement groups:

- The following instance types are supported:
 - Current generation instances, except for [burstable performance](#) instances (for example, T2) and M7i-flex instances.
 - The following previous generation instances: A1, C3, C4, I2, M4, R3, and R4.
- A cluster placement group can't span multiple Availability Zones.
- The maximum network throughput speed of traffic between two instances in a cluster placement group is limited by the slower of the two instances. For applications with high-throughput requirements, choose an instance type with network connectivity that meets your requirements.
- For instances that are enabled for enhanced networking, the following rules apply:
 - Instances within a cluster placement group can use up to 10 Gbps for single-flow traffic. Instances that are not within a cluster placement group can use up to 5 Gbps for single-flow traffic.

- Traffic to and from Amazon S3 buckets within the same Region over the public IP address space or through a VPC endpoint can use all available instance aggregate bandwidth.
- You can launch multiple instance types into a cluster placement group. However, this reduces the likelihood that the required capacity will be available for your launch to succeed. We recommend using the same instance type for all instances in a cluster placement group.
- Network traffic to the internet and over an AWS Direct Connect connection to on-premises resources is limited to 5 Gbps for cluster placement groups.

Partition placement group rules and limitations

The following rules apply to partition placement groups:

- A partition placement group supports a maximum of seven partitions per Availability Zone. The number of instances that you can launch in a partition placement group is limited only by your account limits.
- When instances are launched into a partition placement group, Amazon EC2 tries to evenly distribute the instances across all partitions. Amazon EC2 doesn't guarantee an even distribution of instances across all partitions.
- A partition placement group with Dedicated Instances can have a maximum of two partitions.
- Capacity Reservations do not reserve capacity in a partition placement group.

Spread placement group rules and limitations

The following rules apply to spread placement groups:

- A rack spread placement group supports a maximum of seven running instances per Availability Zone. For example, in a Region with three Availability Zones, you can run a total of 21 instances in the group, with seven instances in each Availability Zone. If you try to start an eighth instance in the same Availability Zone and in the same spread placement group, the instance will not launch. If you need more than seven instances in an Availability Zone, we recommend that you use multiple spread placement groups. Using multiple spread placement groups does not provide guarantees about the spread of instances between groups, but it does help ensure the spread for each group, thus limiting the impact from certain classes of failures.
- Spread placement groups are not supported for Dedicated Instances.

- Host level spread placement groups are only supported for placement groups on AWS Outposts. A host level spread placement group can hold as many instances as you have hosts in your Outpost deployment.
- In a Region, a rack level spread placement group can have a maximum of seven running instances per Availability Zone per group. With AWS Outposts, a rack level spread placement group can hold as many instances as you have racks in your Outpost deployment.
- Capacity Reservations do not reserve capacity in a spread placement group.

Work with placement groups

Contents

- [Create a placement group](#)
- [View placement group information](#)
- [Tag a placement group](#)
- [Launch instances in a placement group](#)
- [Describe instances in a placement group](#)
- [Change the placement group for an instance](#)
- [Remove an instance from a placement group](#)
- [Delete a placement group](#)

Create a placement group

You can create a placement group using one of the following methods.

Console

To create a placement group using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Placement Groups**.
3. Choose **Create placement group**.
4. Specify a name for the group.
5. Choose the placement strategy for the group.
 - If you choose **Spread**, choose the spread level.

- **Rack** - no restrictions
 - **Host** - only for Outposts
- If you choose **Partition**, choose the number of partitions within the group.
6. To tag the placement group, choose **Add tag**, and then enter a key and value. Choose **Add tag** for each tag that you want to add.
 7. Choose **Create group**.

AWS CLI

To create a placement group using the AWS CLI

Use the [create-placement-group](#) command. The following example creates a placement group named `my-cluster` that uses the `cluster` placement strategy, and it applies a tag with a key of `purpose` and a value of `production`.

```
aws ec2 create-placement-group \
--group-name my-cluster \
--strategy cluster \
--tag-specifications 'ResourceType=placement-
group,Tags={Key=purpose,Value=production}'
```

To create a partition placement group using the AWS CLI

Use the [create-placement-group](#) command. Specify the `--strategy` parameter with the value `partition`, and specify the `--partition-count` parameter with the desired number of partitions. In this example, the partition placement group is named `HDFS-Group-A` and is created with five partitions.

```
aws ec2 create-placement-group \
--group-name HDFS-Group-A \
--strategy partition \
--partition-count 5
```

PowerShell

To create a placement group using the AWS Tools for Windows PowerShell

Use the [New-EC2PlacementGroup](#) command.

View placement group information

You can view all your placement groups and the information about them using one of the following methods.

Console

To view information about one or more placement groups

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, under **Network & Security**, choose **Placement Groups**.
3. In the **Placement groups** table, for each placement group, you can view the following information:
 - **Group name** – The name that you gave to the placement group.
 - **Group Id** – The ID of the placement group.
 - **Strategy** – The placement strategy for the placement group.
 - **State** – The state of the placement group.
 - **Partition** – The number of partitions. Valid only if the strategy is **partition**.
 - **Group ARN** – The Amazon Resource Name (ARN) of the placement group.

AWS CLI

To describe all your placement groups

Use the [describe-placement-groups](#) AWS CLI command.

```
aws ec2 describe-placement-groups
```

Example response

```
{  
    "PlacementGroups": [  
        {  
            "GroupName": "my-cluster-pg",  
            "State": "available",  
            "Strategy": "cluster",  
            "GroupId": "pg-0123456789example",  
            "Partition": 1  
        }  
    ]  
}
```

```
        "GroupArn": "arn:aws:ec2:eu-west-1:111111111111:placement-group/my-
cluster-pg"
    },
    ...
]
}
```

To describe a specified placement group

Use the [describe-placement-groups](#) AWS CLI command. You can specify either the `--group-id` or the `--group-name` parameter.

Specify placement group ID:

```
aws ec2 describe-placement-groups --group-id pg-0123456789example
```

Specify placement group name:

```
aws ec2 describe-placement-groups --group-name my-cluster-pg
```

Example response

```
{
    "PlacementGroups": [
        {
            "GroupName": "my-cluster-pg",
            "State": "available",
            "Strategy": "cluster",
            "GroupId": "pg-0123456789example",
            "GroupArn": "arn:aws:ec2:eu-west-1:111111111111:placement-group/my-
cluster-pg"
        }
    ]
}
```

Tag a placement group

To help categorize and manage your existing placement groups, you can tag them with custom metadata. For more information about how tags work, see [Tag your Amazon EC2 resources](#).

When you tag a placement group, the instances that are launched into the placement group are not automatically tagged. You need to explicitly tag the instances that are launched into the placement group. For more information, see [Add a tag when you launch an instance](#).

You can view, add, and delete tags using one of the following methods.

Console

To view, add, or delete a tag for an existing placement group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Placement Groups**.
3. Select a placement group, and then choose **Actions, Manage tags**.
4. The **Manage tags** screen displays any tags that are assigned to the placement group.
 - To add a tag, choose **Add tag**, and then enter the tag key and value. You can add up to 50 tags per placement group. For more information, see [Tag restrictions](#).
 - To delete a tag, choose **Remove** next to the tag that you want to delete.
5. Choose **Save**.

AWS CLI

To view placement group tags

Use the [describe-tags](#) command to view the tags for the specified resource. In the following example, you describe the tags for all of your placement groups.

```
aws ec2 describe-tags \
--filters Name=resource-type,Values=placement-group
```

```
{
  "Tags": [
    {
      "Key": "Environment",
      "ResourceId": "pg-0123456789EXAMPLE",
      "ResourceType": "placement-group",
      "Value": "Production"
    },
    {
      "Key": "Environment",
      "ResourceId": "pg-0123456789EXAMPLE",
      "ResourceType": "placement-group",
      "Value": "Development"
    }
  ]
}
```

```
        "Key": "Environment",
        "ResourceId": "pg-9876543210EXAMPLE",
        "ResourceType": "placement-group",
        "Value": "Production"
    }
]
}
```

You can also use the [describe-tags](#) command to view the tags for a placement group by specifying its ID. In the following example, you describe the tags for pg-0123456789EXAMPLE.

```
aws ec2 describe-tags \
--filters Name=resource-id,Values=pg-0123456789EXAMPLE
```

```
{
    "Tags": [
        {
            "Key": "Environment",
            "ResourceId": "pg-0123456789EXAMPLE",
            "ResourceType": "placement-group",
            "Value": "Production"
        }
    ]
}
```

You can also view the tags of a placement group by describing the placement group.

Use the [describe-placement-groups](#) command to view the configuration of the specified placement group, which includes any tags that were specified for the placement group.

```
aws ec2 describe-placement-groups \
--group-name my-cluster
```

```
{
    "PlacementGroups": [
        {
            "GroupName": "my-cluster",
            "State": "available",
            "Strategy": "cluster",
        }
    ]
}
```

```
        "GroupId": "pg-0123456789EXAMPLE",
        "Tags": [
            {
                "Key": "Environment",
                "Value": "Production"
            }
        ]
    }
}
```

To tag an existing placement group using the AWS CLI

You can use the [create-tags](#) command to tag existing resources. In the following example, the existing placement group is tagged with Key=Cost-Center and Value=CC-123.

```
aws ec2 create-tags \
--resources pg-0123456789EXAMPLE \
--tags Key=Cost-Center,Value=CC-123
```

To delete a tag from a placement group using the AWS CLI

You can use the [delete-tags](#) command to delete tags from existing resources. For examples, see [Examples](#) in the *AWS CLI Command Reference*.

PowerShell

To view placement group tags

Use the [Get-EC2Tag](#) command.

To describe the tags for a specific placement group

Use the [Get-EC2PlacementGroup](#) command.

To tag an existing placement group

Use the [New-EC2Tag](#) command.

To delete a tag from a placement group

Use the [Remove-EC2Tag](#) command.

Launch instances in a placement group

You can launch an instance into a placement group if the [placement group rules and limitations are met](#) using one of the following methods.

Console

To launch instances into a placement group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the EC2 console dashboard, in the **Launch instance** box, choose **Launch instance**. Complete the form as directed, taking care to do the following:
 - Under **Instance type**, select an instance type that can be launched into a placement group.
 - In the **Summary** box, under **Number of instances**, enter the total number of instances that you need in this placement group, because you might not be able to add instances to the placement group later.
 - Under **Advanced details**, for **Placement group name**, you can choose to add the instances to a new or existing placement group. If you choose a placement group with a partition strategy, for **Target partition**, choose the partition in which to launch the instances.

AWS CLI

To launch instances into a placement group

Use the [run-instances](#) command and specify the placement group name using the --placement "GroupName = *my-cluster*" parameter. In this example, the placement group is named my-cluster.

```
aws ec2 run-instances --placement "GroupName = my-cluster"
```

To launch instances into a specific partition of a partition placement group using the AWS CLI

Use the [run-instances](#) command and specify the placement group name and partition using the --placement "GroupName = *HDFS-Group-A*, PartitionNumber = 3" parameter. In this example, the placement group is named HDFS-Group-A and the partition number is 3.

```
aws ec2 run-instances --placement "GroupName = HDFS-Group-A, PartitionNumber = 3"
```

PowerShell

To launch instances into a placement group using AWS Tools for Windows PowerShell

Use the [New-EC2Instance](#) command and specify the placement group name using the `-Placement_GroupName` parameter.

Describe instances in a placement group

You can view the placement information of your instances using one of the following methods. You can also filter partition placement groups by the partition number using the AWS CLI.

Console

To view the placement group and partition number of an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. On the **Details** tab, under **Host and placement group**, find **Placement group**. If the instance is not in a placement group, the field is empty. Otherwise, it contains the name of the placement group name. If the placement group is a partition placement group, **Partition number** contains the partition number for the instance.

AWS CLI

To view the partition number for an instance in a partition placement group

Use the [describe-instances](#) command and specify the `--instance-id` parameter.

```
aws ec2 describe-instances --instance-id i-0123a456700123456
```

The response contains the placement information, which includes the placement group name and the partition number for the instance.

```
"Placement": {
```

```
    "AvailabilityZone": "us-east-1c",
    "GroupName": "HDFS-Group-A",
    "PartitionNumber": 3,
    "Tenancy": "default"
}
```

To filter instances for a specific partition placement group and partition number

Use the [describe-instances](#) command and specify the --filters parameter with the placement-group-name and placement-partition-number filters. In this example, the placement group is named HDFS-Group-A and the partition number is 7.

```
aws ec2 describe-instances --filters "Name = placement-group-name, Values = HDFS-Group-A" "Name = placement-partition-number, Values = 7"
```

The response lists all the instances that are in the specified partition within the specified placement group. The following is example output showing only the instance ID, instance type, and placement information for the returned instances.

```
"Instances": [
    {
        "InstanceId": "i-0a1bc23d4567e8f90",
        "InstanceType": "r4.large",
    },
    {
        "Placement": {
            "AvailabilityZone": "us-east-1c",
            "GroupName": "HDFS-Group-A",
            "PartitionNumber": 7,
            "Tenancy": "default"
        }
    },
    {
        "InstanceId": "i-0a9b876cd5d4ef321",
        "InstanceType": "r4.large",
    },
    {
        "Placement": {
            "AvailabilityZone": "us-east-1c",
            "GroupName": "HDFS-Group-A",
            "PartitionNumber": 7,
            "Tenancy": "default"
        }
    }
]
```

```
    }  
],
```

Change the placement group for an instance

You can change the placement group for an instance as follows:

- Move an existing instance to a placement group
- Move an instance from one placement group to another

Before you can move the instance, the instance must be in the stopped state.

Console

To move an instance to a placement group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, and then choose **Instance state, Stop instance**.
4. With the instance selected, choose **Actions, Instance settings, Modify instance placement**.
5. For **Placement group**, choose the placement group to move the instance to.
6. Choose **Save**.

AWS CLI

To move an instance to a placement group

1. Stop the instance using the [stop-instances](#) command.
2. Use the [modify-instance-placement](#) command and specify the name of the placement group to move the instance to.

```
aws ec2 modify-instance-placement \  
  --instance-id i-0123a456700123456 \  
  --group-name MySpreadGroup
```

3. Start the instance using the [start-instances](#) command.

PowerShell

To move an instance to a placement group using the AWS Tools for Windows PowerShell

1. Stop the instance using the [Stop-EC2Instance](#) command.
2. Use the [Edit-EC2InstancePlacement](#) command and specify the name of the placement group to which to move the instance.
3. Start the instance using the [Start-EC2Instance](#) command.

Remove an instance from a placement group

You can remove an instance from a placement group using one of the following methods.

Before you can remove an instance from a placement group, the instance must be in the stopped state.

Console

To remove an instance from a placement group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, and then choose **Instance state, Stop instance**.
4. With the instance selected, choose **Actions, Instance settings, Modify instance placement**.
5. For **Placement group**, choose **None**.
6. Choose **Save**.

AWS CLI

To remove an instance from a placement group

1. Stop the instance using the [stop-instances](#) command.
2. Use the [modify-instance-placement](#) command and specify an empty string for the placement group name.

```
aws ec2 modify-instance-placement \
--instance-id i-0123a456700123456 \
```

```
--group-name ""
```

3. Start the instance using the [start-instances](#) command.

PowerShell

To remove an instance from a placement group using the AWS Tools for Windows PowerShell

1. Stop the instance using the [Stop-EC2Instance](#) command.
2. Use the [Edit-EC2InstancePlacement](#) command and specify an empty string for the placement group name.
3. Start the instance using the [Start-EC2Instance](#) command.

Delete a placement group

If you need to replace a placement group or no longer need one, you can delete it. You can delete a placement group using one of the following methods.

Prerequisite

Before you can delete a placement group, it must contain no instances. You can [terminate](#) all instances that you launched in the placement group, [move](#) instances to another placement group, or [remove](#) instances from the placement group.

Console

To delete a placement group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Placement Groups**.
3. Select the placement group and choose **Actions, Delete**.
4. When prompted for confirmation, enter **Delete** and then choose **Delete**.

AWS CLI

To delete a placement group

Use the [delete-placement-group](#) command and specify the placement group name to delete the placement group. In this example, the placement group name is *my-cluster*.

```
aws ec2 delete-placement-group --group-name my-cluster
```

PowerShell

To delete a placement group using the AWS Tools for Windows PowerShell

Use the [Remove-EC2PlacementGroup](#) command to delete the placement group.

Share a placement group

Placement group sharing allows you to influence the placement of interdependent instances that are owned by separate AWS accounts. You can share a placement group across multiple AWS accounts or within your organizations. You can launch instances in a shared placement group.

A placement group owner can share a placement group with:

- Specific AWS accounts inside or outside of its organization
- An organizational unit inside its organization
- Its entire organization

Note

The AWS account from which you want to share a placement group must have the following permissions in the IAM policy.

- `ec2:PutResourcePolicy`
- `ec2:DeleteResourcePolicy`

Topics

- [Rules and limitations](#)
- [Share across Availability Zones](#)
- [Share a placement group](#)

- [Identify a shared placement group](#)
- [Launch an instance in a shared placement group](#)
- [Unshare a shared placement group](#)

Rules and limitations

The following rules and limitations apply when you share a placement group or when a placement group is shared with you.

- To share a placement group, you must own it in your AWS account. You cannot share a placement group that has been shared with you.
- When you share a partition or spread placement group, the placement group limits do not change. A shared partition placement group supports a maximum of seven partitions per Availability Zone, and a shared spread placement group supports a maximum of seven running instances per Availability Zone.
- To share a placement group with your organization or an organizational unit in your organization, you must enable sharing with AWS Organizations. For more information, see [Sharing your AWS resources](#).
- You are responsible for managing the instances owned by you in a shared placement group.
- You cannot view or modify instances and capacity reservations that are associated with a shared placement group but not owned by you.

Share across Availability Zones

To ensure that resources are distributed across the Availability Zones for a Region, we independently map Availability Zones to names for each account. This could lead to Availability Zone naming differences across accounts. For example, the Availability Zone us-east-1a for your AWS account might not have the same location as us-east-1a for another AWS account.

To identify the location of your Dedicated Hosts relative to your accounts, you must use the *Availability Zone ID* (AZ ID). The Availability Zone ID is a unique and consistent identifier for an Availability Zone across all AWS accounts. For example, use1-az1 is an Availability Zone ID for the us-east-1 Region and it is the same location in every AWS account.

To view the Availability Zone IDs for the Availability Zones in your account

1. Open the AWS RAM console at <https://console.aws.amazon.com/ram>.

2. The Availability Zone IDs for the current Region are displayed under **Your AZ ID** in the right panel.

Share a placement group

To share a placement group, you must add it to a resource share. A resource share is an AWS RAM resource that lets you share your resources across AWS accounts. A resource share specifies the resources to share, and the consumers with whom they are shared.

If you are part of an organization in AWS Organizations sharing within your organization is enabled, consumers in your organization are granted access to the shared placement group.

If the placement group is shared with an AWS account outside of your organization, the AWS account owner will receive an invitation to join the resource share. They can access the shared placement group after accepting the invitation.

You can share a placement group across AWS accounts using <https://console.aws.amazon.com/ram> or AWS CLI.

AWS RAM console

To share a placement group you own using <https://console.aws.amazon.com/ram>, see [Creating a resource share](#).

AWS CLI

To share a placement group you own, use the [create-resource-share](#) command.

Identify a shared placement group

The Amazon Resource Name (ARN) of a placement group contains the 12-digit account ID of the account that owns the placement group. You can use the account ID to identify the owner of a placement group that is shared with you.

You can find the placement group ARN using one of the following methods. For more information, see [View placement group information](#).

Amazon EC2 console

To identify a shared placement group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, under **Network & Security**, choose **Placement Groups**.
3. The **Placement groups** table lists all the placement groups that are owned by you and shared with you. The **Group ARN** column displays the placement group ARN.

If the **Group ARN** column isn't visible, choose settings (

) in the top-right corner, turn on **Group ARN**, and choose **Confirm**.

AWS CLI

To identify a shared placement group

Use [describe-placement-groups](#) command to list all the placement groups that are owned by you and shared with you. In the response, the **GroupId** parameter displays the ARN of a placement group.

Launch an instance in a shared placement group

Important

When using the AWS CLI to launch an instance in a shared placement group, you must specify the placement group ID by using the **GroupId** parameter.

You can use the placement group name only if you're the owner of the placement group being shared. We recommend using the placement group ID to avoid potential placement group name collisions between AWS accounts.

You can find the ID of a placement group in the Amazon EC2 console on the **Placement Groups** screen or by using the [describe-placement-groups](#) AWS CLI command. For more information, see [View placement group information](#).

Console

To launch instances into a shared placement group

1. Follow the procedure to [launch an instance](#), but don't launch the instance until you've completed the following steps to specify the settings for the placement group.
2. Under **Instance type**, select a supported instance type. For more information, see [Placement group rules and limitations](#).
3. Expand **Advanced details**, and configure the placement group settings as follows:
 - a. For **Placement group**, select the placement group that was shared with you.

Note
If there are placement groups with the same name, check the placement group ID to make sure that you select the correct placement group.
 - b. If you choose a placement group with a partition strategy, for **Target partition**, choose the partition in which to launch the instance.
4. In the **Summary** panel, do the following:
 - a. For **Number of instances**, enter the total number of instances that you need in this placement group, because you might not be able to add instances to the placement group later.
 - b. Review your instance configuration, and then choose **Launch instance**.

For more information, see [Launch an instance using the new launch instance wizard](#).

AWS CLI

To launch instances in a shared placement group

Use the [run-instances](#) command and specify the placement group ID of the shared placement group.

```
aws ec2 run-instances --placement "GroupId = pg-0123456789example"
```

To launch instances into a specific partition of a shared partition placement group

Use the [run-instances](#) command and specify the placement group ID and the partition number of the shared placement group.

```
aws ec2 run-instances --placement "GroupId = pg-0123456789example, PartitionNumber = 3"
```

Tip

Use VPC peering to connect instances owned by separate AWS accounts and get the full latency benefits offered by shared cluster placement groups. For more information, see [What is VPC peering?](#)

Unshare a shared placement group

The placement group owner can unshare a shared placement group at any time.

When you unshare a shared placement group, the following changes will take effect.

- The AWS accounts with which a placement group was shared will no longer be able to launch instances or reserve capacity.
- If your instances were running in a shared placement group, they will be disassociated from the placement group but continue to run normally in your AWS account.
- If you had capacity reservations in a shared placement group, they will be disassociated from the placement group but you will continue to have access to them in your AWS account.

You can unshare a shared placement group using one of the following methods.

AWS RAM console

To unshare a shared placement group using <https://console.aws.amazon.com/ram>, see [Deleting a resource share](#).

AWS CLI

To unshare a shared placement group using AWS Command Line Interface, use the [disassociate-resource-share](#) command.

Placement groups on AWS Outposts

AWS Outposts is a fully managed service that extends AWS infrastructure, services, APIs, and tools to customer premises. By providing local access to AWS managed infrastructure, AWS Outposts enables customers to build and run applications on premises using the same programming interfaces as in AWS Regions, while using local compute and storage resources for lower latency and local data processing needs.

An Outpost is a pool of AWS compute and storage capacity deployed at a customer site. AWS operates, monitors, and manages this capacity as part of an AWS Region.

You can create placement groups on Outposts that you have created in your account. This allows you to spread out instances across underlying hardware on an Outpost at your site. You create and use placement groups on Outposts in the same way that you create and use placement groups in regular Availability Zones. When you create a placement group with a spread strategy on an Outpost, you can choose to have the placement group spread instances across hosts or racks. Spreading instances across hosts allows you to use a spread strategy with a single rack Outpost.

Considerations

- A rack level spread placement group can hold as many instances as you have racks in your Outpost deployment.
- A host level spread placement group can hold as many instances as you have hosts in your Outpost deployment.

Prerequisite

You must have an Outpost installed at your site. For more information, see [Create an Outpost and order Outpost capacity](#) in the *AWS Outposts User Guide*.

To use a placement group on an Outpost

1. Create a subnet on the Outpost. For more information, see [Create a subnet](#) in the *AWS Outposts User Guide*.
2. Create a placement group in the associated Region of the Outpost. If you create a placement group with a spread strategy, you can choose host or rack level spread to determine how the group will spread instances across the underlying hardware on your Outpost. For more information, see [the section called “Create a placement group”](#).

3. Launch an instance into the placement group. For **Subnet** choose the subnet that you created in Step 1, and for **Placement group name**, select the placement group that you created in Step 2. For more information, see [Launch an instance on the Outpost](#) in the *AWS Outposts User Guide*.

Network maximum transmission unit (MTU) for your EC2 instance

The maximum transmission unit (MTU) of a network connection is the size, in bytes, of the largest permissible packet that can be passed over the connection. The larger the MTU of a connection, the more data that can be passed in a single packet. Ethernet frames consist of the packet, or the actual data you are sending, and the network overhead information that surrounds it.

Ethernet frames can come in different formats, and the most common format is the standard Ethernet v2 frame format. It supports 1500 MTU, which is the largest Ethernet packet size supported over most of the internet. The maximum supported MTU for an instance depends on its instance type.

The following rules apply to instances that are in Wavelength Zones:

- Traffic that goes from one instance to another within a VPC in the same Wavelength Zone has an MTU of 1300.
- Traffic that goes from one instance to another that uses the carrier IP within a Wavelength Zone has an MTU of 1500.
- Traffic that goes from one instance to another between a Wavelength Zone and the Region that uses a public IP address has an MTU of 1500.
- Traffic that goes from one instance to another between a Wavelength Zone and the Region that uses a private IP address has an MTU of 1300.

The following rules apply to instances that are in Outposts:

- Traffic that goes from an instance in Outposts to an instance in the Region has an MTU of 1300.

To see Network MTU information for Linux instances, switch to this page in the *Amazon EC2 User Guide for Linux Instances* guide: [Network maximum transmission unit \(MTU\) for your EC2 instance](#).

Contents

- [Jumbo frames \(9001 MTU\)](#)
- [Path MTU Discovery](#)
- [Check the path MTU between two hosts](#)
- [Check and set the MTU on your Windows instance](#)
- [Troubleshoot](#)

Jumbo frames (9001 MTU)

Jumbo frames allow more than 1500 bytes of data by increasing the payload size per packet, and thus increasing the percentage of the packet that is not packet overhead. Fewer packets are needed to send the same amount of usable data. However, traffic is limited to a maximum MTU of 1500 in the following cases:

- Traffic over an internet gateway
- Traffic over an inter-region VPC peering connection
- Traffic over VPN connections
- Traffic outside of a given AWS Region for EC2-Classic

If packets are over 1500 bytes, they are fragmented, or they are dropped if the Don't Fragment flag is set in the IP header.

Jumbo frames should be used with caution for internet-bound traffic or any traffic that leaves a VPC. Packets are fragmented by intermediate systems, which slows down this traffic. To use jumbo frames inside a VPC and not slow traffic that's bound for outside the VPC, you can configure the MTU size by route, or use multiple elastic network interfaces with different MTU sizes and different routes.

For instances that are collocated inside a cluster placement group, jumbo frames help to achieve the maximum network throughput possible, and they are recommended in this case. For more information, see [Placement groups](#).

You can use jumbo frames for traffic between your VPCs and your on-premises networks over AWS Direct Connect. For more information, and for how to verify Jumbo Frame capability, see [Setting Network MTU](#) in the *AWS Direct Connect User Guide*.

All Amazon EC2 instance types support 1500 MTU and all current generation instance types support jumbo frames. The following previous generation instance types support jumbo frames: A1, C3, I2, M3, and R3.

For more information about supported MTU sizes:

- For NAT gateways, see [NAT gateway basics](#) in the *Amazon VPC User Guide*.
- For transit gateways, see [MTU](#) in the *Amazon VPC Transit Gateways User Guide*.
- For Local Zones, see [Considerations](#) in the *AWS Local Zones User Guide*.

Path MTU Discovery

Path MTU Discovery (PMTUD) is used to determine the path MTU between two devices. The path MTU is the maximum packet size that's supported on the path between the originating host and the receiving host. When there is a difference in the MTU size in the network between two hosts, PMTUD enables the receiving host to respond to the originating host with an ICMP message. This ICMP message instructs the originating host to use the lowest MTU size along the network path and to resend the request. Without this negotiation, packet drop can occur because the request is too large for the receiving host to accept.

For IPv4, when a host sends a packet that's larger than the MTU of the receiving host or that's larger than the MTU of a device along the path, the receiving host or device drops the packet, and then returns the following ICMP message: Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4). This instructs the transmitting host to split the payload into multiple smaller packets, and then retransmit them.

The IPv6 protocol does not support fragmentation in the network. When a host sends a packet that's larger than the MTU of the receiving host or that's larger than the MTU of a device along the path, the receiving host or device drops the packet, and then returns the following ICMP message: ICMPv6 Packet Too Big (PTB) (Type 2). This instructs the transmitting host to split the payload into multiple smaller packets, and then retransmit them.

Connections made through some components, like NAT gateways and load balancers, are [automatically tracked](#). This means that [security group tracking](#) is automatically enabled for your outbound connection attempts. If connections are automatically tracked or if your security group rules allow inbound ICMP traffic, you can receive PMTUD responses.

Note that ICMP traffic can be blocked even if the traffic is allowed at the security group level, such as if you have a network access control list entry that denies ICMP traffic to the subnet.

Important

Path MTU Discovery does not guarantee that jumbo frames will not be dropped by some routers. An internet gateway in your VPC will forward packets up to 1500 bytes only. 1500 MTU packets are recommended for internet traffic.

Check the path MTU between two hosts

You can check the path MTU between two hosts using the **mturoute.exe** command, which you can download and install from <http://www.elifulkerson.com/projects/mturoute.php>.

To check path MTU using mturoute.exe

1. Download **mturoute.exe** from <http://www.elifulkerson.com/projects/mturoute.php>.
2. Open a Command Prompt window and change to the directory where you downloaded **mturoute.exe**.
3. Use the following command to check the path MTU between your EC2 instance and another host. You can use a DNS name or an IP address as the destination. If the destination is another EC2 instance, verify that the security group allows inbound UDP traffic. This example checks the path MTU between an EC2 instance and www.elifulkerson.com.

```
.\mturoute.exe www.elifulkerson.com
* ICMP Fragmentation is not permitted. *
* Speed optimization is enabled. *
* Maximum payload is 10000 bytes. *
+ ICMP payload of 1472 bytes succeeded.
- ICMP payload of 1473 bytes is too big.
Path MTU: 1500 bytes.
```

In this example, the path MTU is 1500.

Check and set the MTU on your Windows instance

Some drivers are configured to use jumbo frames, and others are configured to use standard frame sizes. You might want to use jumbo frames for network traffic within your VPC or standard frames for internet traffic. Whatever your use case, we recommend that you verify that your instances behave as expected.

If your instance runs in a Wavelength Zone, the maximum MTU value is 1300.

ENa Driver

For Driver Versions 1.5 and Earlier

You can change the MTU setting using Device Manager or the **Set-NetAdapterAdvancedProperty** command.

To get the current MTU setting using the **Get-NetAdapterAdvancedProperty** command, use the following command. Check the entry for the interface name MTU. A value of 9001 indicates that Jumbo frames are enabled. Jumbo frames are disabled by default.

```
Get-NetAdapterAdvancedProperty -Name "Ethernet"
```

Enable jumbo frames as follows:

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "MTU" -RegistryValue  
9001
```

Disable jumbo frames as follows:

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "MTU" -RegistryValue  
1500
```

For Driver Versions 2.1.0 and Later

You can change the MTU setting using Device Manager or the **Set-NetAdapterAdvancedProperty** command.

To get the current MTU setting using the **Get-NetAdapterAdvancedProperty** command, use the following command. Check the entry for the interface name *JumboPacket. A value of 9015 indicates that Jumbo frames are enabled. Jumbo frames are disabled by default.

Run **Get-NetAdapterAdvancedProperty** or use wildcard (asterisk) to detect all corresponding Ethernet names.

```
Get-NetAdapterAdvancedProperty -Name "Ethernet*"
```

Run the following commands and include the Ethernet name you want to query.

```
Get-NetAdapterAdvancedProperty -Name "Ethernet"
```

Enable jumbo frames as follows.

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -  
RegistryValue 9015
```

Disable jumbo frames as follows:

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -  
RegistryValue 1514
```

Intel SRIOV 82599 driver

You can change the MTU setting using Device Manager or the **Set-NetAdapterAdvancedProperty** command.

To get the current MTU setting using the **Get-NetAdapterAdvancedProperty** command, use the following command. Check the entry for the interface name *JumboPacket. A value of 9014 indicates that Jumbo frames are enabled. (Note that the MTU size includes the header and the payload.) Jumbo frames are disabled by default.

```
Get-NetAdapterAdvancedProperty -Name "Ethernet"
```

Enable jumbo frames as follows:

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -  
RegistryValue 9014
```

Disable jumbo frames as follows:

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -  
RegistryValue 1514
```

AWS PV driver

You cannot change the MTU setting using Device Manager, but you can change it using the **netsh** command.

Get the current MTU setting using the following command. The name of the interface can vary. In the output, look for an entry with the name "Ethernet," "Ethernet 2," or "Local Area Connection". You'll need the interface name to enable or disable jumbo frames. A value of 9001 indicates that Jumbo frames are enabled.

```
netsh interface ipv4 show subinterface
```

Enable jumbo frames as follows:

```
netsh interface ipv4 set subinterface "Ethernet" mtu=9001
```

Disable jumbo frames as follows:

```
netsh interface ipv4 set subinterface "Ethernet" mtu=1500
```

Troubleshoot

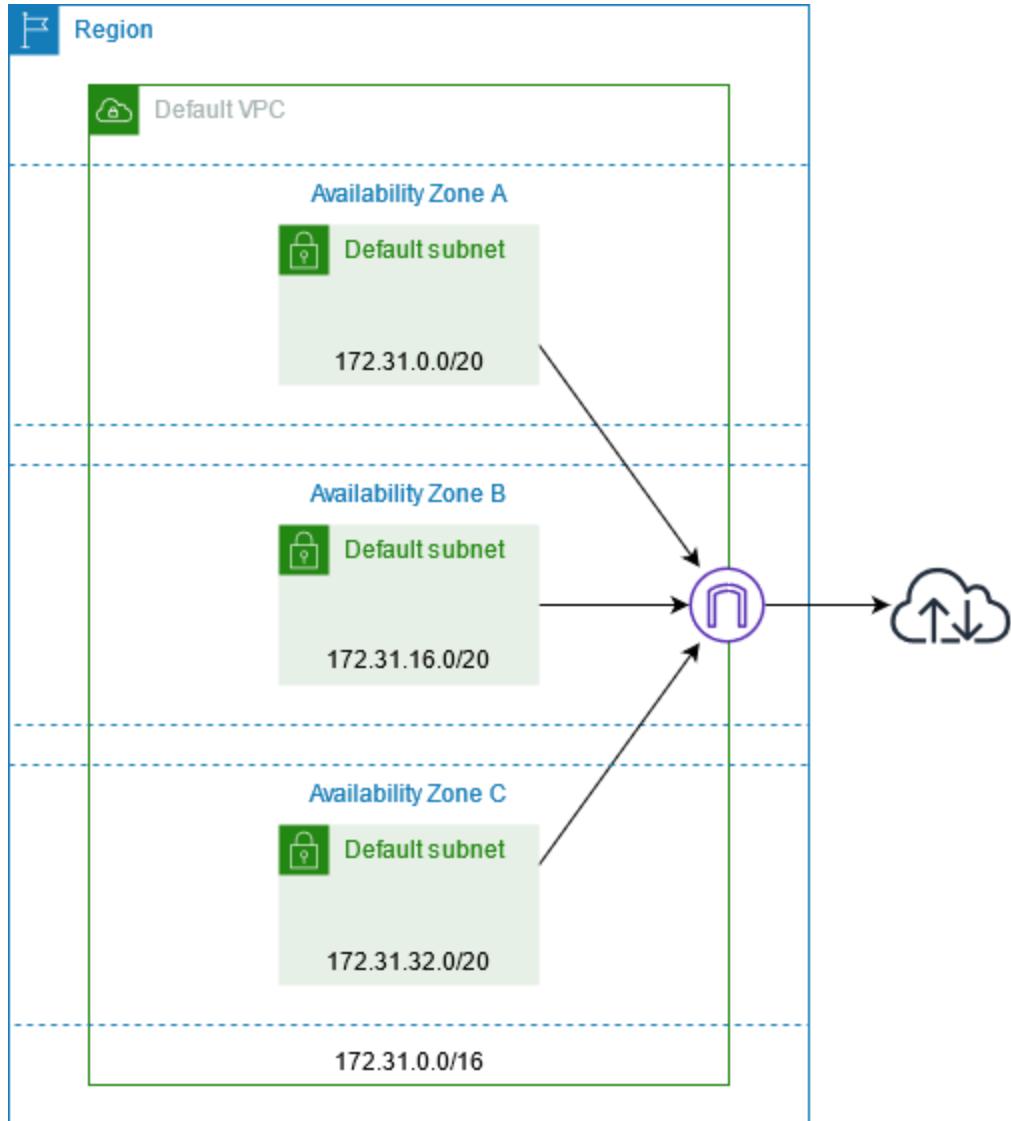

If you experience connectivity issues between your EC2 instance and an Amazon Redshift cluster when using jumbo frames, see [Queries Appear to Hang in the Amazon Redshift Management Guide](#)

Virtual private clouds

Amazon Virtual Private Cloud (Amazon VPC) enables you to define a virtual network in your own logically isolated area within the AWS cloud, known as a *virtual private cloud* or *VPC*. You can create AWS resources, such as Amazon EC2 instances, into the subnets of your VPC. Your VPC closely resembles a traditional network that you might operate in your own data center, with the benefits of using scalable infrastructure from AWS. You can configure your VPC; you can select its IP address range, create subnets, and configure route tables, network gateways, and security settings. You can connect instances in your VPC to the internet or to your own data center.

Your default VPCs

When you create your AWS account, we create a *default VPC* in each Region. A default VPC is a VPC that is already configured and ready for you to use. For example, there is a default subnet for each Availability Zone in each default VPC, an internet gateway attached to the VPC, and there's a route in the main route table that sends all traffic (0.0.0.0/0) to the internet gateway. Alternatively, you can create your own VPC and configure it to meet your needs.

Create additional VPCs

Use the following procedure to create a VPC with the subnets, gateways, and routing configuration that you need.

To create a VPC

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. Choose **Create VPC**.
3. Under **Resources to create**, choose **VPC and more**.
4. For **Name tag auto-generation**, enter a name for the VPC.
5. For **IPv4 CIDR block**, either keep the default suggestion, enter the CIDR block required by your application or network.
6. For **Number of Availability Zones**, choose **2**, so that you can launch instances in multiple Availability Zones to ensure high availability.
7. If your instances must be accessible from the internet, do one of the following:
 - If your instances can be in a public subnet, select a nonzero value for **Number of public subnets**. Keep both options under **DNS options** selected. You can optionally add private subnets now or later on.
 - If your instances must be in a private subnet, select **0** for **Number of public subnets**. For **Number of private subnets**, select a number depending on your needs (the possible values correspond to 1 or 2 private subnets per Availability Zone). For **NAT gateways**, if your instances in both Availability Zones send or receive a significant volume of traffic across Availability Zones, select **1 per AZ**. Otherwise, select **In 1 AZ** and launch instances that send or receive cross-zone traffic in the same Availability Zone as the NAT gateway.
8. Expand **Customize subnet CIDR blocks**. Either keep the default suggestions, or enter a CIDR block for each subnet. For more information, see [Subnet CIDR blocks](#) in the *Amazon VPC User Guide*.
9. Review the **Preview** pane, which shows the VPC resources that will be created based on your selections.
10. Choose **Create VPC**.

Access the internet from your instances

Instances launched into a default subnet have access to the internet, as the VPC is configured to assign public IP addresses and DNS hostnames, and the main route table is configured with a route to an internet gateway attached to the VPC.

For the subnets that you create in your VPCs, do one of the following to ensure that instances that you launch in these subnets have access to the internet:

- Configure an internet gateway. For more information, see [Connect to the internet using an internet gateway](#) in the *Amazon VPC User Guide*.
- Configure a public NAT gateway. For more information, see [Access the internet from a private subnet](#) in the *Amazon VPC User Guide*.

Shared subnets

When launching EC2 instances into shared VPC subnets, note the following:

- Participants can run instances in a shared VPC subnet by passing in the shared subnet ID. If participants want to pass in a security group ID or network interface ID when they run an instance, the participant must own the security group or network interface.
- Participants can start, stop, terminate, and describe instances that they've created in a shared VPC subnet. Participants cannot start, stop, terminate, or describe instances created by the VPC owner in a shared VPC subnet.
- VPC owners cannot start, stop, terminate, or describe instances created by participants in a shared VPC subnet.

For more information see, [Share your VPC with other accounts](#) in the *Amazon VPC User Guide*.

IPv6-only subnets

An EC2 instance launched in an IPv6-only subnet receives an IPv6 address but not an IPv4 address. Any instances that you launch into an IPv6-only subnet must be [instances built on the AWS Nitro System](#).

RDP access to your instances

To connect to an instance, you must authorize RDP traffic to the instance from your network. You must also specify a key pair when you launch the instance and specify the .pem file when you connect to the instance. For more information, see [Prerequisites](#).

Ports and Protocols for Windows Amazon Machine Images (AMIs)

The following tables list the ports, protocols, and directions by workload for Windows Amazon Machine Images.

Contents

- [AllJoyn Router](#)

AllJoyn Router

OS	Rule	Description	Port	Protocol	Direction
Windows Server 2016	AllJoyn Router (TCP-In)	Inbound rule for AllJoyn Router traffic [TCP]	Local: 9955 Remote: Any	TCP	In
Windows Server 2019					
Windows Server 2022	AllJoyn Router (TCP-Out)	Outbound rule for AllJoyn	Local: Any Remote: Any	TCP	Out

OS	Rule	Description	Port	Protocol	Direction
		Router traffic [TCP]			
	AllJoyn Router (UDP-In)	Inbound rule for AllJoyn Router traffic [UDP]	Local: Any Remote: Any	UDP	In
	AllJoyn Router (UDP-Out)	Outbound rule for AllJoyn Router traffic [UDP]	Local: Any Remote: Any	UDP	Out

Cast to Device

OS	Rule	Description	Port	Protocol	Direction
Windows Server 2016	Cast to Device functionality	Inbound rule for the Cast to Device functionality to allow use of the Quality Windows Audio Video Experience Service. [TCP 2177]	Local: 2177 Remote: Any	TCP	In
Windows Server 2019					
Windows Server 2022	Cast to Device functionality	Outbound rule for the Cast to Device	Local: Any Remote: 2177	TCP	Out

OS	Rule	Description	Port	Protocol	Direction
	(qWave-TCP-Out)	functionality to allow use of the Quality Windows Audio Video Experience Service. [TCP 2177]			
	Cast to Device functionality (qWave-UDP-In)	Inbound rule for the Cast to Device functionality to allow use of the Quality Windows Audio Video Experience Service. [UDP 2177]	Local: 2177 Remote: Any	UDP	In

OS	Rule	Description	Port	Protocol	Direction
	Cast to Device functionality (qWave-UDP-Out)	Outbound rule for the Cast to Device functionality to allow use of the Quality Windows Audio Video Experience Service. [UDP 2177]	Local: Any Remote: 2177	UDP	Out
	Cast to Device SSDP Discovery (UDP-In)	Inbound rule to allow discovery of Cast to Device targets using SSDP	Local: Ply2Disc Remote: Any	UDP	In
	Cast to Device Streaming Server (HTTP-Streaming-In)	Inbound rule for the Cast to Device server to allow streaming using HTTP. [TCP 10246]	Local: 10246 Remote: Any	TCP	In

OS	Rule	Description	Port	Protocol	Direction
	Cast to Device Streaming Server (RTCP-Streaming-In)	Inbound rule for the Cast to Device server to allow streaming using RTSP and RTP. [UDP]	Local: Any Remote: Any	UDP	In
	Cast to Device Streaming Server (RTP-Streaming-Out)	Outbound rule for the Cast to Device server to allow streaming using RTSP and RTP. [UDP]	Local: Any Remote: Any	UDP	Out
	Cast to Device Streaming Server (RTSP-Streaming-In)	Inbound rule for the Cast to Device server to allow streaming using RTSP and RTP. [TCP 23554, 23555, 23556]	Local: 235, 542, 355, 523, 556 Remote: Any	TCP	In

OS	Rule	Description	Port	Protocol	Direction
	Cast to Device UPnP Events (TCP-In)	Inbound rule to allow receiving UPnP Events from Cast to Device targets	Local: 2869 Remote: Any	TCP	In

Core Networking

Windows Server 2016, 2019, and 2022

OS	Rule	Definition	Port	Protocol	Direction
Windows Server 2016	Destination Unreachable (ICMPv6-In)	Destination Unreachable error messages are sent from any node that a packet traverses which is unable to forward the packet for any reason except congestion.		ICMPv6	In
Windows Server 2019					
Windows Server 2022	Destination Unreachable Fragments	Destination Unreachable Fragments		ICMPv4	In

OS	Rule	Definition	Port	Protocol	Direction
	tion Needed (ICMPv4-In)	tion Needed error messages are sent from any node that a packet traverses which is unable to forward the packet because fragmentation was needed and the don't fragment bit was set.			

OS	Rule	Definition	Port	Protocol	Direction
	Core Networking - DNS (UDP-Out)	Outbound rule to allow DNS requests. DNS responses based on requests that match this rule are permitted regardless of source address. This behavior is classified as loose source mapping.	Local: Any Remote: 53	UDP	Out
	Dynamic Host Configuration Protocol (DHCP-In)	Allows DHCP (Dynamic Host Configuration Protocol) messages for stateful auto-configuration.	Local: 68 Remote: 67	UDP	In

OS	Rule	Definition	Port	Protocol	Direction
	Dynamic Host Configuration Protocol (DHCP-Out)	Allows DHCP (Dynamic Host Configuration Protocol) messages for stateful auto-configuration.	Local: 68 Remote: 67	UDP	Out
	Dynamic Host Configuration Protocol for IPv6(DHCP V6-In)	Allows DHCPV6 (Dynamic Host Configuration Protocol for IPv6) messages for stateful and stateless configuration.	Local: 546 Remote: 547	UDP	In

OS	Rule	Definition	Port	Protocol	Direction
	Dynamic Host Configuration Protocol for IPv6(DHCP V6-Out)	Allows DHCPV6 (Dynamic Host Configuration Protocol for IPv6) messages for stateful and stateless configuration.	Local: 546 Remote: 547	UDP	Out
	Core Networking - Group Policy (LSASS-Out)	Outbound rule to allow remote LSASS traffic for Group Policy updates.	Local: Any Remote: Any	TCP	Out
	Core Networking - Group Policy (NP-Out)	Core Networking - Group Policy (NP-Out)	Local: Any Remote: 445	TCP	Out
	Core Networking - Group Policy (TCP-Out)	Outbound rule to allow remote RPC traffic for Group Policy updates.	Local: Any Remote: Any	TCP	Out

OS	Rule	Definition	Port	Protocol	Direction
	Internet Group Management Protocol (IGMP-In)	IGMP messages are sent and received by nodes to create, join, and depart multicast groups.		2	In
	Core Networking - Internet Group Management Protocol (IGMP-Out)	IGMP messages are sent and received by nodes to create, join, and depart multicast groups.		2	Out
	Core Networking - IPHTTPS (TCP-In)	Inbound TCP rule to allow IPHTTPS tunneling technology to provide connectivity across HTTP proxies and firewalls.	Local: IPHTTPS Remote: Any	TCP	In

OS	Rule	Definition	Port	Protocol	Direction
	Core Networking - IPHTTPS (TCP-Out)	Outbound TCP rule to allow IPHTTPS tunneling technology to provide connectivity across HTTP proxies and firewalls.	Local: Any Remote: IPHTTPS	TCP	Out
	IPv6 (IPv6-In)	Inbound rule required to permit IPv6 traffic for ISATAP (Intra-Site Automatic Tunnel Addressing Protocol) and 6to4 tunneling services.	41		In

OS	Rule	Definition	Port	Protocol	Direction
	IPv6 (IPv6-Out)	Outbound rule required to permit IPv6 traffic for ISATAP (Intra-Site Automatic Tunnel Addressing Protocol) and 6to4 tunneling services.		41	Out
	Multicast Listener Done (ICMPv6-In)	Multicast Listener Done messages inform local routers that there are no longer any members remaining for a specific multicast address on the subnet.		ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Done (ICMPv6-Out)	Multicast Listener Done messages inform local routers that there are no longer any members remaining for a specific multicast address on the subnet.		ICMPv6	Out
	Multicast Listener Query (ICMPv6-In)	An IPv6 multicast-capable router uses the Multicast Listener Query message to query a link for multicast group membership.		ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Query (ICMPv6-Out)	An IPv6 multicast-capable router uses the Multicast Listener Query message to query a link for multicast group membership.		ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report (ICMPv6-In)	The Multicast Listener Report message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address or in response to a Multicast Listener Query.		ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report (ICMPv6-Out)	The Multicast Listener Report message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address or in response to a Multicast Listener Query.		ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report v2 (ICMPv6-In)	Multicast Listener Report v2 message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address or in response to a Multicast Listener Query.		ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report v2 (ICMPv6-Out)	Multicast Listener Report v2 message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address or in response to a Multicast Listener Query.		ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Neighbor Discovery Advertise ment (ICMPv6-In)	Neighbor Discovery Advertise ment messages are sent by nodes to notify other nodes of link-layer address changes or in response to a Neighbor Discovery Solicitation request.		ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Neighbor Discovery Advertise ment (ICMPv6-Out)	Neighbor Discovery Advertise ment messages are sent by nodes to notify other nodes of link-layer address changes or in response to a Neighbor Discovery Solicitation request.		ICMPv6	Out
	Neighbor Discovery Solicitation (ICMPv6-In)	Neighbor Discovery Solicitations are sent by nodes to discover the link-layer address of another on-link IPv6 node.		ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Neighbor Discovery Solicitation (ICMPv6-Out)	Neighbor Discovery Solicitations are sent by nodes to discover the link-layer address of another on-link IPv6 node.		ICMPv6	Out
	Packet Too Big (ICMPv6-In)	Big error messages are sent from any node that a packet traverses which is unable to forward the packet because the packet is too large for the next link.		ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Packet Too Big (ICMPv6-Out)	Packet Too Big error messages are sent from any node that a packet traverses which is unable to forward the packet because the packet is too large for the next link.		ICMPv6	Out
	Parameter Problem (ICMPv6-In)	Parameter Problem error messages are sent by nodes when packets are incorrectly generated.		ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Parameter Problem (ICMPv6-Out)	Parameter Problem error messages are sent by nodes when packets are incorrectly generated.		ICMPv6	Out
	Router Advertisement (ICMPv6-In)	Router Advertisement messages are sent by routers to other nodes for stateless auto-configuration.		ICMPv6	In
	Router Advertisement (ICMPv6-Out)	Router Advertisement messages are sent by routers to other nodes for stateless auto-configuration.		ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Router Solicitation (ICMPv6-In)	Router Solicitation messages are sent by nodes seeking routers to provide stateless auto-conf iguration.		ICMPv6	In
	Router Solicitation (ICMPv6-O ut)	Router Solicitation messages are sent by nodes seeking routers to provide stateless auto-conf iguration.		ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Core Networking - Teredo (UDP-In)	Inbound UDP rule to allow Teredo edge traversal. This technology provides address assignment and automatic tunneling for unicast IPv6 traffic when an IPv6/IPv4 host is located behind an IPv4 network address translator.	Local: Teredo Remote: Any	UDP	In

OS	Rule	Definition	Port	Protocol	Direction
	Core Networking - Teredo (UDP-Out)	Outbound UDP rule to allow Teredo edge traversal. This technology provides address assignment and automatic tunneling for unicast IPv6 traffic when an IPv6/IPv4 host is located behind an IPv4 network address translator.	Local: Any Remote: Any	UDP	Out

OS	Rule	Definition	Port	Protocol	Direction
	Time Exceeded (ICMPv6-In)	Time exceeded error messages are generated from any node that a packet traverses if the Hop Limit value is decremented to zero at any point on the path.		ICMPv6	In
	Time Exceeded (ICMPv6-Out)	Time exceeded error messages are generated from any node that a packet traverses if the Hop Limit value is decremented to zero at any point on the path.		ICMPv6	Out

Windows Server 2012 and 2012 R2

OS	Rule	Definition	Port	Protocol	Direction
Windows Server 2012 Windows Server 2012 R2	Destination Unreachable (ICMPv6-In)	Destination Unreachable error messages are sent from any node that a packet traverses which is unable to forward the packet for any reason except congestion.	Local: 68 Remote: 67	ICMPv6	In
	Destination Unreachable Fragmentation Needed (ICMPv4-In)	Destination Unreachable Fragmentation Needed error messages are sent from any node that a packet traverses which is unable to forward the packet because	Local: 68 Remote: 67	ICMPv4	In

OS	Rule	Definition	Port	Protocol	Direction
		fragmentation was needed and the don't fragment bit was set.			
	Core Networking - DNS (UDP-Out)	<p>Outbound rule to allow DNS requests.</p> <p>DNS responses based on requests that match this rule are permitted regardless of source address. This behavior is classified as loose source mapping.</p>	Local: Any Remote: 53	UDP	Out

OS	Rule	Definition	Port	Protocol	Direction
	Dynamic Host Configuration Protocol (DHCP-In)	Allows DHCP (Dynamic Host Configuration Protocol) messages for stateful auto-configuration.	Local: 68 Remote: 67	UDP	In
	Dynamic Host Configuration Protocol (DHCP-Out)	Allows DHCP (Dynamic Host Configuration Protocol) messages for stateful auto-configuration.	Local: 68 Remote: 67	UDP	Out
	Dynamic Host Configuration Protocol for IPv6(DHCP V6-In)	Allows DHCPV6 (Dynamic Host Configuration Protocol for IPv6) messages for stateful and stateless configuration.	Local: 546 Remote: 547	UDP	In

OS	Rule	Definition	Port	Protocol	Direction
	Dynamic Host Configuration Protocol for IPv6(DHCP V6-Out)	Allows DHCPV6 (Dynamic Host Configuration Protocol for IPv6) messages for stateful and stateless configuration.	Local: 546 Remote: 547	UDP	Out
	Core Networking - Group Policy (LSASS-Out)	Outbound rule to allow remote LSASS traffic for Group Policy updates.	Local: Any Remote: Any	TCP	Out
	Core Networking - Group Policy (NP-Out)	Core Networking - Group Policy (NP-Out)	Local: Any Remote: 445	TCP	Out
	Core Networking - Group Policy (TCP-Out)	Outbound rule to allow remote RPC traffic for Group Policy updates.	Local: Any Remote: Any	TCP	Out

OS	Rule	Definition	Port	Protocol	Direction
	Internet Group Management Protocol (IGMP-In)	IGMP messages are sent and received by nodes to create, join, and depart multicast groups.	Local: 68 Remote: 67	2	In
	Core Networking - Internet Group Management Protocol (IGMP-Out)	IGMP messages are sent and received by nodes to create, join, and depart multicast groups.	Local: 68 Remote: 67	2	Out
	Core Networking - IPHTTPS (TCP-In)	Inbound TCP rule to allow IPHTTPS tunneling technology to provide connectivity across HTTP proxies and firewalls.	Local: IPHTTPS Remote: Any	TCP	In

OS	Rule	Definition	Port	Protocol	Direction
	Core Networking - IPHTTPS (TCP-Out)	Outbound TCP rule to allow IPHTTPS tunneling technology to provide connectivity across HTTP proxies and firewalls.	Local: Any Remote: IPHTTPS	TCP	Out
	IPv6 (IPv6-In)	Inbound rule required to permit IPv6 traffic for ISATAP (Intra-Site Automatic Tunnel Addressing Protocol) and 6to4 tunneling services.	Local: Any Remote: 445	41	In

OS	Rule	Definition	Port	Protocol	Direction
	IPv6 (IPv6-Out)	Outbound rule required to permit IPv6 traffic for ISATAP (Intra-Site Automatic Tunnel Addressing Protocol) and 6to4 tunneling services.	Local: Any Remote: 445	41	Out
	Multicast Listener Done (ICMPv6-In)	Multicast Listener Done messages inform local routers that there are no longer any members remaining for a specific multicast address on the subnet.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Done (ICMPv6-Out)	Multicast Listener Done messages inform local routers that there are no longer any members remaining for a specific multicast address on the subnet.	Local: 68 Remote: 67	ICMPv6	Out
	Multicast Listener Query (ICMPv6-In)	An IPv6 multicast-capable router uses the Multicast Listener Query message to query a link for multicast group membership.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Query (ICMPv6-Out)	An IPv6 multicast-capable router uses the Multicast Listener Query message to query a link for multicast group membership.	Local: 68 Remote: 67	ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report (ICMPv6-In)	The Multicast Listener Report message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address or in response to a Multicast Listener Query.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report (ICMPv6-Out)	The Multicast Listener Report message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address or in response to a Multicast Listener Query.	Local: 68 Remote: 67	ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report v2 (ICMPv6-In)	Multicast Listener Report v2 message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address or in response to a Multicast Listener Query.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report v2 (ICMPv6-Out)	Multicast Listener Report v2 message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address or in response to a Multicast Listener Query.	Local: 68 Remote: 67	ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Neighbor Discovery Advertise ment (ICMPv6-In)	Neighbor Discovery Advertise ment messages are sent by nodes to notify other nodes of link-layer address changes or in response to a Neighbor Discovery Solicitation request.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Neighbor Discovery Advertise ment (ICMPv6-Out)	Neighbor Discovery Advertise ment messages are sent by nodes to notify other nodes of link-layer address changes or in response to a Neighbor Discovery Solicitation request.	Local: 68 Remote: 67	ICMPv6	Out
	Neighbor Discovery Solicitation (ICMPv6-In)	Neighbor Discovery Solicitations are sent by nodes to discover the link-layer address of another on-link IPv6 node.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Neighbor Discovery Solicitation (ICMPv6-Out)	Neighbor Discovery Solicitations are sent by nodes to discover the link-layer address of another on-link IPv6 node.	Local: 68 Remote: 67	ICMPv6	Out
	Packet Too Big (ICMPv6-In)	Packet Too Big error messages are sent from any node that a packet traverses which is unable to forward the packet because the packet is too large for the next link.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Packet Too Big (ICMPv6-Out)	Packet Too Big error messages are sent from any node that a packet traverses which is unable to forward the packet because the packet is too large for the next link.	Local: 68 Remote: 67	ICMPv6	Out
	Parameter Problem (ICMPv6-In)	Parameter Problem error messages are sent by nodes when packets are incorrectly generated.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Parameter Problem (ICMPv6-Out)	Parameter Problem error messages are sent by nodes when packets are incorrectly generated.	Local: 68 Remote: 67	ICMPv6	Out
	Router Advertisement (ICMPv6-In)	Router Advertisement messages are sent by routers to other nodes for stateless auto-configuration.	Local: 68 Remote: 67	ICMPv6	In
	Router Advertisement (ICMPv6-Out)	Router Advertisement messages are sent by routers to other nodes for stateless auto-configuration.	Local: 68 Remote: 67	ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Router Solicitation (ICMPv6-In)	Router Solicitation messages are sent by nodes seeking routers to provide stateless auto-conf iguration.	Local: 68 Remote: 67	ICMPv6	In
	Router Solicitation (ICMPv6-O ut)	Router Solicitation messages are sent by nodes seeking routers to provide stateless auto-conf iguration.	Local: 68 Remote: 67	ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Core Networking - Teredo (UDP-In)	Inbound UDP rule to allow Teredo edge traversal. This technology provides address assignment and automatic tunneling for unicast IPv6 traffic when an IPv6/IPv4 host is located behind an IPv4 network address translator.	Local: Teredo Remote: Any	UDP	In

OS	Rule	Definition	Port	Protocol	Direction
	Core Networking - Teredo (UDP-Out)	Outbound UDP rule to allow Teredo edge traversal. This technology provides address assignment and automatic tunneling for unicast IPv6 traffic when an IPv6/IPv4 host is located behind an IPv4 network address translator.	Local: Any Remote: Any	UDP	Out

OS	Rule	Definition	Port	Protocol	Direction
	Time Exceeded (ICMPv6-In)	Time Exceeded error messages are generated from any node that a packet traverses if the Hop Limit value is decremented to zero at any point on the path.	Local: 68 Remote: 67	ICMPv6	In
	Time Exceeded (ICMPv6-Out)	Time Exceeded error messages are generated from any node that a packet traverses if the Hop Limit value is decremented to zero at any point on the path.	Local: 68 Remote: 67	ICMPv6	Out

Windows Server 2008 R2 and SP2

OS	Rule	Definition	Port	Protocol	Direction
Windows Server 2008 R2	Destination Unreachable (ICMPv6-In)	Destination Unreachable error messages are sent from any node that a packet traverses which is unable to forward the packet for any reason except congestion.	Local: 68 Remote: 67	ICMPv6	In
Windows Server 2008 SP2	Destination Unreachable Fragmentation Needed (ICMPv4-In)	Destination Unreachable Fragmentation Needed error messages are sent from any node that a packet traverses which is unable to forward the packet because	Local: 68 Remote: 67	ICMPv4	In

OS	Rule	Definition	Port	Protocol	Direction
		fragmentation was needed and the don't fragment bit was set.			
	Dynamic Host Configuration Protocol (DHCP-In)	Allows DHCP (Dynamic Host Configuration Protocol) messages for stateful auto-configuration.	Local: 68 Remote: 67	UDP	In
	Dynamic Host Configuration Protocol (DHCP-Out)	Allows DHCP (Dynamic Host Configuration Protocol) messages for stateful auto-configuration.	Local: 68 Remote: 67	UDP	Out

OS	Rule	Definition	Port	Protocol	Direction
	Dynamic Host Configuration Protocol for IPv6(DHCP V6-In)	Allows DHCPV6 (Dynamic Host Configuration Protocol for IPv6) messages for stateful and stateless configuration.	Local: 546 Remote: 547	UDP	In
	Dynamic Host Configuration Protocol for IPv6(DHCP V6-Out)	Allows DHCPV6 (Dynamic Host Configuration Protocol for IPv6) messages for stateful and stateless configuration.	Local: 546 Remote: 547	UDP	Out
	Internet Group Management Protocol (IGMP-In)	IGMP messages are sent and received by nodes to create, join, and depart multicast groups.	Local: 68 Remote: 67	2	In

OS	Rule	Definition	Port	Protocol	Direction
	IPv6 (IPv6-In)	Inbound rule required to permit IPv6 traffic for ISATAP (Intra-Site Automatic Tunnel Addressing Protocol) and 6to4 tunneling services.	Local: Any Remote: 445	41	In
	IPv6 (IPv6-Out)	Outbound rule required to permit IPv6 traffic for ISATAP (Intra-Site Automatic Tunnel Addressing Protocol) and 6to4 tunneling services.	Local: Any Remote: 445	41	Out

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Done (ICMPv6-In)	Multicast Listener Done messages inform local routers that there are no longer any members remaining for a specific multicast address on the subnet.	Local: 68 Remote: 67	ICMPv6	In
	Multicast Listener Done (ICMPv6-Out)	Multicast Listener Done messages inform local routers that there are no longer any members remaining for a specific multicast address on the subnet.	Local: 68 Remote: 67	ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Query (ICMPv6-In)	An IPv6 multicast-capable router uses the Multicast Listener Query message to query a link for multicast group membership.	Local: 68 Remote: 67	ICMPv6	In
	Multicast Listener Query (ICMPv6-Out)	An IPv6 multicast-capable router uses the Multicast Listener Query message to query a link for multicast group membership.	Local: 68 Remote: 67	ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report (ICMPv6-In)	The Multicast Listener Report message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address, or in response to a Multicast Listener Query.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report (ICMPv6-Out)	The Multicast Listener Report message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address, or in response to a Multicast Listener Query.	Local: 68 Remote: 67	ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report v2 (ICMPv6-In)	Multicast Listener Report v2 message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address, or in response to a Multicast Listener Query.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Multicast Listener Report v2 (ICMPv6-Out)	Multicast Listener Report v2 message is used by a listening node to either immediately report its interest in receiving multicast traffic at a specific multicast address, or in response to a Multicast Listener Query.	Local: 68 Remote: 67	ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Neighbor Discovery Advertise ment (ICMPv6-In)	Neighbor Discovery Advertise ment messages are sent by nodes to notify other nodes of link-layer address changes or in response to a Neighbor Discovery Solicitation request.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Neighbor Discovery Advertise ment (ICMPv6-Out)	Neighbor Discovery Advertise ment messages are sent by nodes to notify other nodes of link-layer address changes or in response to a Neighbor Discovery Solicitation request.	Local: 68 Remote: 67	ICMPv6	Out
	Neighbor Discovery Solicitation (ICMPv6-In)	Neighbor Discovery Solicitations are sent by nodes to discover the link-layer address of another on-link IPv6 node.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Neighbor Discovery Solicitation (ICMPv6-Out)	Neighbor Discovery Solicitations are sent by nodes to discover the link-layer address of another on-link IPv6 node.	Local: 68 Remote: 67	ICMPv6	Out
	Packet Too Big (ICMPv6-In)	Packet Too Big error messages are sent from any node that a packet traverses which is unable to forward the packet because the packet is too large for the next link.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Packet Too Big (ICMPv6-Out)	Packet Too Big error messages are sent from any node that a packet traverses which is unable to forward the packet because the packet is too large for the next link.	Local: 68 Remote: 67	ICMPv6	Out
	Parameter Problem (ICMPv6-In)	Parameter Problem error messages are sent by nodes when packets are incorrectly generated.	Local: 68 Remote: 67	ICMPv6	In

OS	Rule	Definition	Port	Protocol	Direction
	Parameter Problem (ICMPv6-Out)	Parameter Problem error messages are sent by nodes when packets are incorrectly generated.	Local: 68 Remote: 67	ICMPv6	Out
	Router Advertisement (ICMPv6-In)	Router Advertisement messages are sent by routers to other nodes for stateless auto-configuration.	Local: 68 Remote: 67	ICMPv6	In
	Router Advertisement (ICMPv6-Out)	Router Advertisement messages are sent by routers to other nodes for stateless auto-configuration.	Local: 68 Remote: 67	ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Router Solicitation (ICMPv6-In)	Router Solicitation messages are sent by nodes seeking routers to provide stateless auto-conf iguration.	Local: 68 Remote: 67	ICMPv6	In
	Router Solicitation (ICMPv6-O ut)	Router Solicitation messages are sent by nodes seeking routers to provide stateless auto-conf iguration.	Local: 68 Remote: 67	ICMPv6	Out

OS	Rule	Definition	Port	Protocol	Direction
	Time Exceeded (ICMPv6-In)	Time Exceeded error messages are generated from any node that a packet traverses if the Hop Limit value is decremented to zero at any point on the path.	Local: 68 Remote: 67	ICMPv6	In
	Time Exceeded (ICMPv6-Out)	Time Exceeded error messages are generated from any node that a packet traverses if the Hop Limit value is decremented to zero at any point on the path.	Local: 68 Remote: 67	ICMPv6	Out

Delivery Optimization

For more information about Amazon EC2 security groups, see [Amazon EC2 Security Groups for Windows Instances](#).

Security in Amazon EC2

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The [shared responsibility model](#) describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the [AWS Compliance Programs](#). To learn about the compliance programs that apply to Amazon EC2, see [AWS Services in Scope by Compliance Program](#).
- **Security in the cloud** – Your responsibility includes the following areas:
 - Controlling network access to your instances, for example, through configuring your VPC and security groups. For more information, see [Controlling network traffic](#).
 - Managing the credentials used to connect to your instances.
 - Managing the guest operating system and software deployed to the guest operating system, including updates and security patches. For more information, see [Update management in Amazon EC2](#).
 - Configuring the IAM roles that are attached to the instance and the permissions associated with those roles. For more information, see [IAM roles for Amazon EC2](#).

This documentation helps you understand how to apply the shared responsibility model when using Amazon EC2. It shows you how to configure Amazon EC2 to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your Amazon EC2 resources.

For security best practices for Amazon EC2 running Windows Server, see **Security and Network** under [Best practices for Windows on Amazon EC2](#).

Infrastructure security in Amazon EC2

As a managed service, Amazon Elastic Compute Cloud is protected by AWS global network security. For information about AWS security services and how AWS protects infrastructure, see [AWS Cloud Security](#). To design your AWS environment using the best practices for infrastructure security, see [Infrastructure Protection](#) in *Security Pillar AWS Well-Architected Framework*.

You use AWS published API calls to access Amazon EC2 through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the [AWS Security Token Service](#) (AWS STS) to generate temporary security credentials to sign requests.

For more information, see [Infrastructure Protection](#) in the *Security Pillar – AWS Well-Architected Framework*.

Network isolation

A virtual private cloud (VPC) is a virtual network in your own logically isolated area in the AWS Cloud. Use separate VPCs to isolate infrastructure by workload or organizational entity.

A subnet is a range of IP addresses in a VPC. When you launch an instance, you launch it into a subnet in your VPC. Use subnets to isolate the tiers of your application (for example, web, application, and database) within a single VPC. Use private subnets for your instances if they should not be accessed directly from the internet.

To call the Amazon EC2 API from your VPC using private IP addresses, use AWS PrivateLink. For more information, see [Access Amazon EC2 using an interface VPC endpoint](#).

Isolation on physical hosts

Different EC2 instances on the same physical host are isolated from each other as though they are on separate physical hosts. The hypervisor isolates CPU and memory, and the instances are provided virtualized disks instead of access to the raw disk devices.

When you stop or terminate an instance, the memory allocated to it is scrubbed (set to zero) by the hypervisor before it is allocated to a new instance, and every block of storage is reset. This ensures that your data is not unintentionally exposed to another instance.

Network MAC addresses are dynamically assigned to instances by the AWS network infrastructure. IP addresses are either dynamically assigned to instances by the AWS network infrastructure, or assigned by an EC2 administrator through authenticated API requests. The AWS network allows instances to send traffic only from the MAC and IP addresses assigned to them. Otherwise, the traffic is dropped.

By default, an instance cannot receive traffic that is not specifically addressed to it. If you need to run network address translation (NAT), routing, or firewall services on your instance, you can disable source/destination checking for the network interface.

Controlling network traffic

Consider the following options for controlling network traffic to your EC2 instances:

- Restrict access to your instances using [security groups](#). Configure Amazon EC2 instance security groups to permit the minimum required network traffic for the Amazon EC2 instance and to allow access only from defined, expected, and approved locations. For example, if an Amazon EC2

instance is an IIS web server, configure its security groups to permit only inbound HTTP/HTTPS, Windows management traffic, and minimal outbound connections.

- Leverage security groups as the primary mechanism for controlling network access to Amazon EC2 instances. When necessary, use network ACLs sparingly to provide stateless, coarse-grain network control. Security groups are more versatile than network ACLs due to their ability to perform stateful packet filtering and create rules that reference other security groups. However, network ACLs can be effective as a secondary control for denying a specific subset of traffic or providing high-level subnet guard rails. Also, because network ACLs apply to an entire subnet, they can be used as defense-in-depth in case an instance is ever launched unintentionally without a correct security group.
- Centrally manage Windows Firewall settings with Group Policy Objects (GPO) to further enhance network controls. Customers often use the Windows Firewall for further visibility into network traffic and to complement security group filters, creating advanced rules to block specific applications from accessing the network or to filter traffic from a subset IP addresses. For example, the Windows Firewall can limit access to the EC2 metadata service IP address to specific users or applications. Alternatively, a public-facing service might use security groups to restrict traffic to specific ports and the Windows Firewall to maintain a list of explicitly blocked IP addresses.
- When managing Windows instances, limit access to a few well-defined centralized management servers or bastion hosts to reduce the environment's attack surface. Also, use secure administration protocols like RDP encapsulation over SSL/TLS. The Remote Desktop Gateway Quick Start provides best practices for deploying remote desktop gateway, including configuring RDP to use SSL/TLS.
- Use Active Directory or AWS Directory Service to tightly and centrally control and monitor interactive user and group access to Windows instances, and avoid local user permissions. Also avoid using Domain Administrators and instead create more granular, application-specific role-based accounts. Just Enough Administration (JEA) allows changes to Windows instances to be managed without interactive or administrator access. In addition, JEA enables organizations to lock down administrative access to the subset of Windows PowerShell commands required for instance administration. For additional information, see the section on "Managing OS-level Access to Amazon EC2" in the [AWS Security Best Practices](#) whitepaper.
- Systems Administrators should use Windows accounts with limited access to perform daily activities, and only elevate access when necessary to perform specific configuration changes. Additionally, only access Windows instances directly when absolutely necessary. Instead, leverage central configuration management systems such as EC2 Run Command, Systems Center

Configuration Manager (SCCM), Windows PowerShell DSC, or Amazon EC2 Systems Manager (SSM) to push changes to Windows servers.

- Configure Amazon VPC subnet route tables with the minimal required network routes. For example, place only Amazon EC2 instances that require direct Internet access into subnets with routes to an Internet Gateway, and place only Amazon EC2 instances that need direct access to internal networks into subnets with routes to a virtual private gateway.
- Consider using additional security groups or ENIs to control and audit Amazon EC2 instance management traffic separately from regular application traffic. This approach allows customers to implement special IAM policies for change control, making it easier to audit changes to security group rules or automated rule-verification scripts. Multiple ENIs also provide additional options for controlling network traffic including the ability to create host-based routing policies or leverage different VPC subnet routing rules based on an ENI's assigned subnet.
- Use AWS Virtual Private Network or AWS Direct Connect to establish private connections from your remote networks to your VPCs. For more information, see [Network-to-Amazon VPC Connectivity Options](#).
- Use [VPC Flow Logs](#) to monitor the traffic that reaches your instances.
- Use [GuardDuty Malware Protection](#) to identify suspicious behavior indicative of malicious software on your instances that might compromise your workload, repurpose resources for malicious use, and gain unauthorized access to your data.
- Use [GuardDuty Runtime Monitoring](#) to identify and respond to potential threats to your instances. For more information, see [How Runtime Monitoring works with Amazon EC2 instances](#).
- Use [AWS Security Hub](#), [Reachability Analyzer](#), or [Network Access Analyzer](#) to check for unintended network accessibility from your instances.
- Use [AWS Systems Manager Session Manager](#) to access your instances remotely instead of opening inbound RDP ports.
- Use [AWS Systems Manager Run Command](#) to automate common administrative tasks instead of opening inbound RDP ports.
- Many of the Windows OS roles and Microsoft business applications also provide enhanced functionality such as IP Address Range restrictions within IIS, TCP/IP filtering policies in Microsoft SQL Server, and connection filter policies in Microsoft Exchange. Network restriction functionality within the application layer can provide additional layers of defense for critical business application servers.

Amazon VPC supports additional network security controls, such as gateways, proxy servers, and network monitoring options. For more information, see [Control network traffic](#) in the *Amazon VPC User Guide*.

Resilience in Amazon EC2

The AWS global infrastructure is built around AWS Regions and Availability Zones. Regions provide multiple physically separated and isolated Availability Zones, which are connected through low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

If you need to replicate your data or applications over greater geographic distances, use AWS Local Zones. An AWS Local Zone is an extension of an AWS Region in geographic proximity to your users. Local Zones have their own connections to the internet and support AWS Direct Connect. Like all AWS Regions, AWS Local Zones are completely isolated from other AWS Zones.

If you need to replicate your data or applications in an AWS Local Zone, AWS recommends that you use one of the following zones as the failover zone:

- Another Local Zone
- An Availability Zone in the Region that is not the parent zone. You can use the [describe-availability-zones](#) command to view the parent zone.

For more information about AWS Regions and Availability Zones, see [AWS Global Infrastructure](#).

In addition to the AWS global infrastructure, Amazon EC2 offers the following features to support your data resiliency:

- Copying AMIs across Regions
- Copying EBS snapshots across Regions
- Automating EBS-backed AMIs using Amazon Data Lifecycle Manager
- Automating EBS snapshots using Amazon Data Lifecycle Manager
- Maintaining the health and availability of your fleet using Amazon EC2 Auto Scaling
- Distributing incoming traffic across multiple instances in a single Availability Zone or multiple Availability Zones using Elastic Load Balancing

Data protection in Amazon EC2

The AWS [shared responsibility model](#) applies to data protection in Amazon Elastic Compute Cloud. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the [Data Privacy FAQ](#). For information about data protection in Europe, see the [AWS Shared Responsibility Model and GDPR](#) blog post on the [AWS Security Blog](#).

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see [Federal Information Processing Standard \(FIPS\) 140-2](#).

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with Amazon EC2 or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Topics

- [Amazon EBS data security](#)
- [Encryption at rest](#)
- [Encryption in transit](#)

Amazon EBS data security

Amazon EBS volumes are presented to you as raw, unformatted block devices. These devices are logical devices that are created on the EBS infrastructure and the Amazon EBS service ensures that the devices are logically empty (that is, the raw blocks are zeroed or they contain cryptographically pseudorandom data) prior to any use or re-use by a customer.

If you have procedures that require that all data be erased using a specific method, either after or before use (or both), such as those detailed in **DoD 5220.22-M** (National Industrial Security Program Operating Manual) or **NIST 800-88** (Guidelines for Media Sanitization), you have the ability to do so on Amazon EBS. That block-level activity will be reflected down to the underlying storage media within the Amazon EBS service.

Encryption at rest

EBS volumes

Amazon EBS encryption is an encryption solution for your EBS volumes and snapshots. It uses AWS KMS keys. For more information, see [Amazon EBS encryption](#) in the *Amazon EBS User Guide*.

You can also use Microsoft EFS and NTFS permissions for folder- and file-level encryption.

Instance store volumes

The data on NVMe instance store volumes is encrypted using an XTS-AES-256 cipher, implemented on a hardware module on the instance. The keys used to encrypt data that's written to locally-attached NVMe storage devices are per-customer, and per volume. The keys are generated by, and only reside within, the hardware module, which is inaccessible to AWS personnel. The encryption keys are destroyed when the instance is stopped or terminated and cannot be recovered. You cannot disable this encryption and you cannot provide your own encryption key.

The data on HDD instance store volumes on H1, D3, and D3en instances is encrypted using XTS-AES-256 and one-time keys.

When you stop, hibernate, or terminate an instance, every block of storage in the instance store volume is reset. Therefore, your data cannot be accessed through the instance store of another instance.

Memory

Memory encryption is enabled on the following instances:

- Instances with AWS Graviton processors. AWS Graviton2, AWS Graviton3, and AWS Graviton3E support always-on memory encryption. The encryption keys are securely generated within the host system, do not leave the host system, and are destroyed when the host is rebooted or powered down. For more information, see [AWS Graviton Processors](#).
- Instances with 3rd generation Intel Xeon Scalable processors (Ice Lake), such as M6i instances, and 4th generation Intel Xeon Scalable processors (Sapphire Rapids), such as M7i instances. These processors support always-on memory encryption using Intel Total Memory Encryption (TME).
- Instances with 3rd generation AMD EPYC processors (Milan), such as M6a instances, and 4th generation AMD EPYC processors (Genoa), such as M7a instances. These processors support always-on memory encryption using AMD Secure Memory Encryption (SME). Instances with 3rd generation AMD EPYC processors (Milan) also support AMD Secure Encrypted Virtualization-Secure Nested Paging (SEV-SNP).

Encryption in transit

Encryption at the physical layer

All data flowing across AWS Regions over the AWS global network is automatically encrypted at the physical layer before it leaves AWS secured facilities. All traffic between AZs is encrypted. Additional layers of encryption, including those listed in this section, may provide additional protections.

Encryption provided by Amazon VPC and Transit Gateway cross-Region peering

All cross-Region traffic that uses Amazon VPC and Transit Gateway peering is automatically bulk-encrypted when it exits a Region. An additional layer of encryption is automatically provided at the physical layer for all cross-Region traffic, as previously noted in this section.

Encryption between instances

AWS provides secure and private connectivity between EC2 instances of all types. In addition, some instance types use the offload capabilities of the underlying Nitro System hardware to automatically encrypt in-transit traffic between instances. This encryption uses Authenticated Encryption with Associated Data (AEAD) algorithms, with 256-bit encryption. There is no impact on network performance. To support this additional in-transit traffic encryption between instances, the following requirements must be met:

- The instances use the following instance types:
 - **General purpose:** M5dn, M5n, M5zn, M6a, M6i, M6id, M6idn, M6in, M7a, M7i, M7i-flex
 - **Compute optimized:** C5a, C5ad, C5n, C6a, C6i, C6id, C6in, C7a, C7i
 - **Memory optimized:** R5dn, R5n, R6a, R6i, R6idn, R6in, R6id, R7a, R7i, R7iz, U-3tb1, U-6tb1, U-9tb1, U-12tb1, U-18tb1, U-24tb1, X2idn, X2iedn, X2iezn
 - **Storage optimized:** D3, D3en, I3en, I4i
 - **Accelerated computing:** G4ad, G4dn, G5, P3dn
 - **High-performance computing:** Hpc6id, Hpc7a
- The instances are in the same Region.
- The instances are in the same VPC or peered VPCs, and the traffic does not pass through a virtual network device or service, such as a load balancer or a transit gateway.

An additional layer of encryption is automatically provided at the physical layer for all traffic before it leaves AWS secured facilities, as previously noted in this section.

To view the instance types that encrypt in-transit traffic between instances using the AWS CLI

Use the following [describe-instance-types](#) command.

```
aws ec2 describe-instance-types \
--filters Name=network-info.encryption-in-transit-supported,Values=true \
--query "InstanceTypes[*].[InstanceType]" \
--output text | sort
```

Encryption to and from AWS Outposts

An Outpost creates special network connections called *service links* to its AWS home Region and, optionally, private connectivity to a VPC subnet that you specify. All traffic over those connection is fully encrypted. For more information, see [Connectivity through service links](#) and [Encryption in transit](#) in the *AWS Outposts User Guide*.

Remote access encryption

RDP provides a secure communications channel for remote access to your Windows instances, whether directly or through EC2 Instance Connect. Remote access to your instances using AWS Systems Manager Session Manager or the Run Command is encrypted using TLS 1.2, and requests to create a connection are signed using [SigV4](#) and authenticated and authorized by [AWS Identity and Access Management](#).

It is your responsibility to use an encryption protocol, such as Transport Layer Security (TLS), to encrypt sensitive data in transit between clients and your Amazon EC2 instances.

Make sure to allow only encrypted connections between EC2 instances and the AWS API endpoints or other sensitive remote network services. You can enforce this through an outbound security group or [Windows Firewall](#) rules.

Windows virtualization-based security features

With the AWS Nitro System, you can enable certain Windows virtualization-based security (VBS) features. VBS is a suite of Windows security mechanisms that use hardware virtualization features to create an isolated compute environment. Currently, only Credential Guard is supported. For more information, see [AWS Nitro System](#).

Topics

- [Credential Guard](#)

Credential Guard

The AWS Nitro System supports Credential Guard for Amazon Elastic Compute Cloud (Amazon EC2) Windows instances. Credential Guard is a Windows virtualization-based security (VBS) feature that enables the creation of isolated environments to protect security assets, such as Windows user credentials and code integrity enforcement, beyond Windows kernel protections. When you run EC2 Windows instances, Credential Guard uses the AWS Nitro System to protect Windows login credentials from being extracted from the OS memory.

Topics

- [Prerequisites](#)
- [Launching a supported instance](#)
- [Disabling memory integrity](#)
- [Turning on Credential Guard](#)
- [Verifying Credential Guard is running](#)

Prerequisites

Your Windows instance must meet the following prerequisites to utilize Credential Guard:

Amazon Machine Images (AMIs)

The AMI must be preconfigured to enable NitroTPM and UEFI Secure Boot. For more information on supported AMIs, see [Prerequisites for launching a Windows instance with NitroTPM enabled](#).

Memory integrity

Memory integrity, also known as *hypervisor-protected code integrity (HVCI)* or *hypervisor enforced code integrity*, isn't supported. Before you turn on Credential Guard, you must ensure this feature is disabled. For more information, see [Disabling memory integrity](#).

Instance types

The following instance types support Credential Guard across all sizes: C5, C5d, C5n, C6i, C6id, C6in, M5, M5d, M5dn, M5n, M5zn, M6i, M6id, M6idn, M6in, R5, R5b, R5d, R5dn, R5n, R6i, R6id, R6idn, R6in.

 **Note**

Though NitroTPM has some required instance types in common, the instance type must be one of the above to support Credential Guard.

Launching a supported instance

You can use the Amazon EC2 console or AWS Command Line Interface (AWS CLI) to launch an instance which can support Credential Guard. You will need a compatible AMI ID for launching your instance which is unique for each AWS Region.

 **Tip**

You can use the following link to discover and launch instances with compatible Amazon provided AMIs in the Amazon EC2 console:

https://console.aws.amazon.com/ec2/v2/home?#Images:visibility=public-images;v=3;search=:TPM-Windows_Server;ownerAlias=amazon

Amazon EC2 console

To launch an instance using the Amazon EC2 console

Follow the steps to [Launch an instance using the new launch instance wizard](#) while specifying a supported instance type and preconfigured Windows AMI.

AWS CLI

To launch an instance using the AWS CLI

Use the [run-instances](#) command to launch an instance using a supported instance type and preconfigured Windows AMI.

```
aws ec2 run-instances \
    --image-id resolve:ssm:/aws/service/ami-windows-latest/TPM-Windows_Server-2022-English-Full-Base \
    --instance-type c6i.large \
    --region us-east-1 \
    --subnet-id subnet-id \
    --key-name key-name
```

PowerShell

To launch an instance using the AWS Tools for PowerShell

Use the [New-EC2Instance](#) command to launch an instance using a supported instance type and preconfigured Windows AMI.

```
New-EC2Instance ` 
    -ImageId resolve:ssm:/aws/service/ami-windows-latest/TPM-Windows_Server-2022-English-Full-Base ` 
    -InstanceType c6i.large ` 
    -Region us-east-1 ` 
    -SubnetId subnet-id ` 
    -KeyName key-name
```

Disabling memory integrity

You can use the Local Group Policy Editor to disable memory integrity in supported scenarios. The following guidance can be applied for each configuration setting under **Virtualization Based Protection of Code Integrity**:

- **Enabled without lock** – Modify the setting to **Disabled** to disable memory integrity.

- **Enabled with UEFI lock** – Memory integrity has been enabled with UEFI lock. Memory integrity can't be disabled once it has been enabled with UEFI lock. We recommend creating a new instance with memory integrity disabled and terminating the unsupported instance if it's not in use.

To disable memory integrity with the Local Group Policy Editor

1. Connect to your instance as a user account with administrator privileges using the Remote Desktop Protocol (RDP). For more information, see [Connect to your Windows instance using RDP](#).
2. Open the Start menu and search for **cmd** to start a command prompt.
3. Run the following command to open the Local Group Policy Editor: `gpedit.msc`
4. In the Local Group Policy Editor, choose **Computer Configuration, Administrative Templates, System, Device Guard**.
5. Select **Turn On Virtualization Based Security**, then select **Edit policy setting**.
6. Open the settings drop-down for **Virtualization Based Protection of Code Integrity**, choose **Disabled**, then choose **Apply**.
7. Reboot the instance to apply the changes.

Turning on Credential Guard

After you have launched a Windows instance with a supported instance type and compatible AMI, and confirmed that memory integrity is disabled, you can turn on Credential Guard.

Important

Administrator privileges are required to perform the following steps to turn on Credential Guard.

To turn on Credential Guard

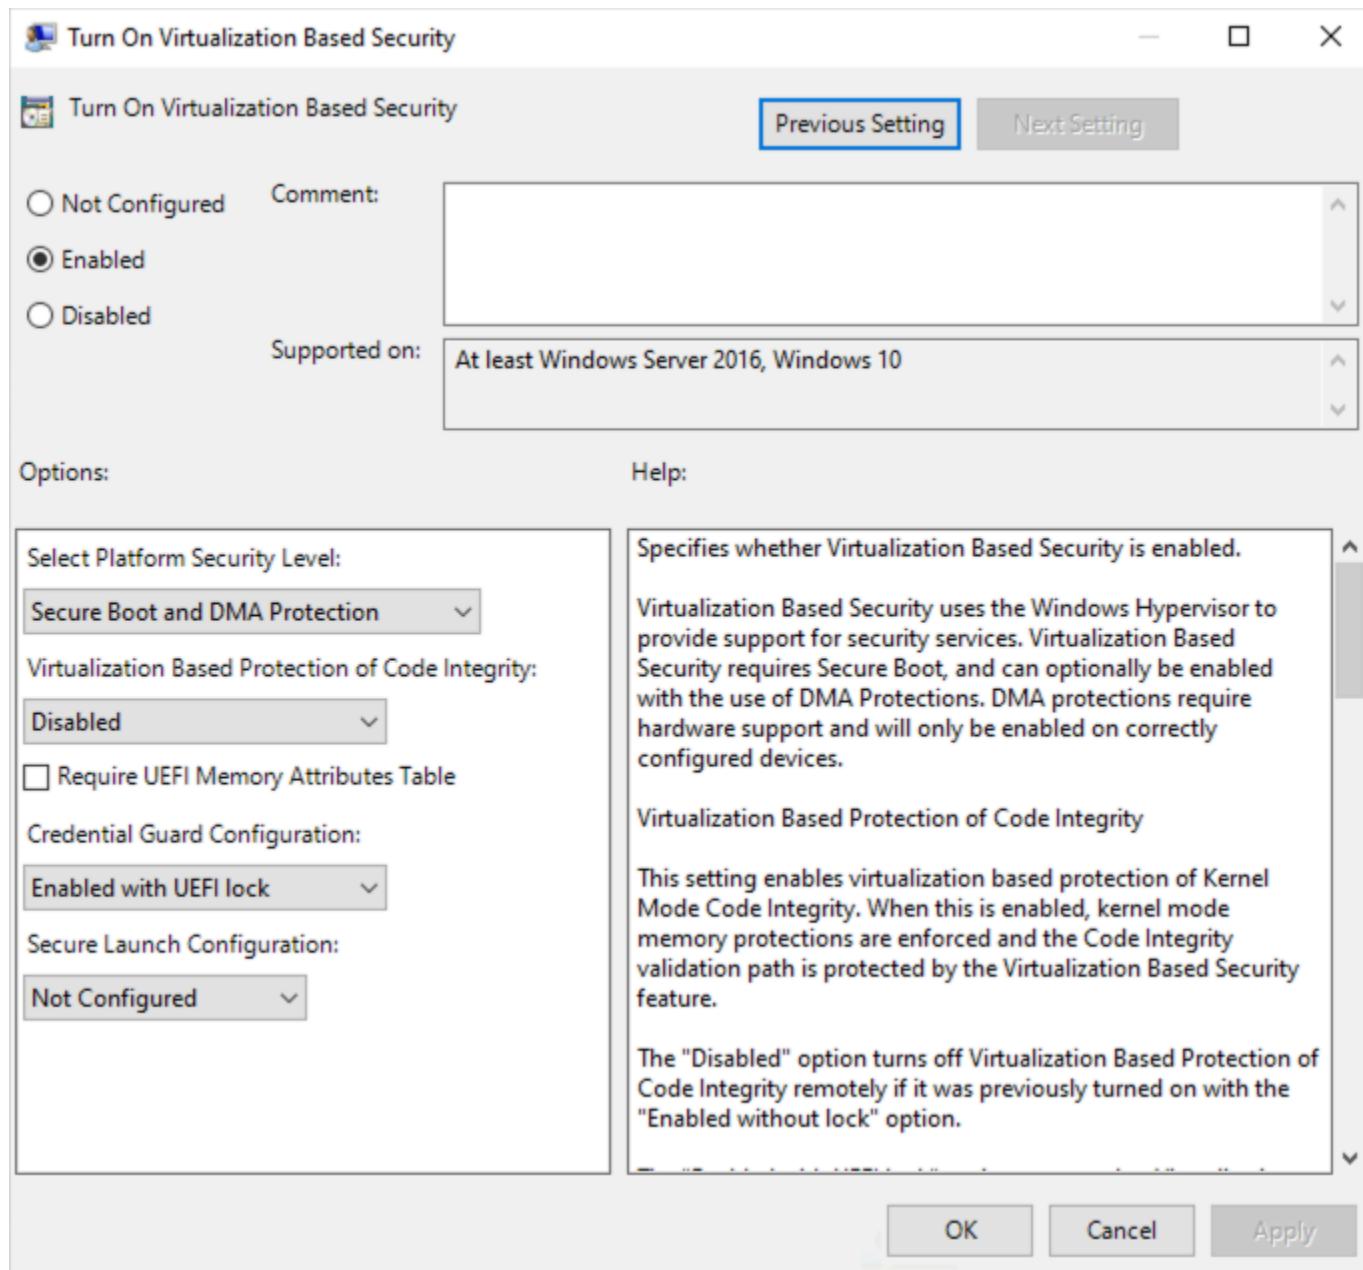

1. Connect to your instance as a user account with administrator privileges using the Remote Desktop Protocol (RDP). For more information, see [Connect to your Windows instance using RDP](#).
2. Open the Start menu and search for **cmd** to start a command prompt.

3. Run the following command to open the Local Group Policy Editor: `gpedit.msc`
4. In the Local Group Policy Editor, choose **Computer Configuration, Administrative Templates, System, Device Guard**.
5. Select **Turn On Virtualization Based Security**, then select **Edit policy setting**.
6. Choose **Enabled** within the **Turn On Virtualization Based Security** menu.
7. For **Select Platform Security Level**, choose **Secure Boot and DMA Protection**.
8. For **Credential Guard Configuration**, choose **Enabled with UEFI lock**.

 **Note**

The remaining policy settings are not required to enable Credential Guard and can be left as **Not Configured**.

The following image displays the VBS settings configured as described previously:

9. Reboot the instance to apply the settings.

Verifying Credential Guard is running

You can use the Microsoft System Information (Msinfo32.exe) tool to confirm that Credential Guard is running.

⚠️ Important

You must first reboot the instance to finish applying the policy settings required to enable Credential Guard.

To verify Credential Guard is running

1. Connect to your instance using the Remote Desktop Protocol (RDP). For more information, see [Connect to your Windows instance using RDP](#).
2. Within the RDP session to your instance, open the Start menu and search for **cmd** to start a command prompt.
3. Open System Information by running the following command: `msinfo32.exe`
4. The Microsoft System Information tool lists the details for VBS configuration. Next to Virtualization-based security Services, confirm that **Credential Guard** appears as **Running**.

The following image displays VBS is running as described previously:

Virtualization-based security	Running
Virtualization-based security Required Security Properties	Base Virtualization Support, Secure Boot, DMA Protection
Virtualization-based security Available Security Properties	Base Virtualization Support, Secure Boot, DMA Protection, UEFI Code Readonly, Mode Based Execution Control
Virtualization-based security Services Configured	Credential Guard
Virtualization-based security Services Running	Credential Guard

Identity and access management for Amazon EC2

Your security credentials identify you to services in AWS and grant you unlimited use of your AWS resources, such as your Amazon EC2 resources. You can use features of Amazon EC2 and AWS Identity and Access Management (IAM) to allow other users, services, and applications to use your Amazon EC2 resources without sharing your security credentials. You can use IAM to control how other users use resources in your AWS account, and you can use security groups to control access to your Amazon EC2 instances. You can choose to allow full use or limited use of your Amazon EC2 resources.

For best practices for securing your AWS resources using IAM, see [Security best practices in IAM](#).

Contents

- [Network access to your instance](#)
- [Amazon EC2 permission attributes](#)

- [IAM and Amazon EC2](#)
- [IAM policies for Amazon EC2](#)
- [AWS managed policies for Amazon Elastic Compute Cloud](#)
- [IAM roles for Amazon EC2](#)
- [Authorize inbound traffic for your Windows instances](#)

Network access to your instance

A security group acts as a firewall that controls the traffic allowed to reach one or more instances. When you launch an instance, you assign it one or more security groups. You add rules to each security group that control traffic for the instance. You can modify the rules for a security group at any time; the new rules are automatically applied to all instances to which the security group is assigned.

For more information, see [Authorize inbound traffic for your Windows instances](#).

Amazon EC2 permission attributes

Your organization might have multiple AWS accounts. Amazon EC2 enables you to specify additional AWS accounts that can use your Amazon Machine Images (AMIs) and Amazon EBS snapshots. These permissions work at the AWS account level only; you can't restrict permissions for specific users within the specified AWS account. All users in the AWS account that you've specified can use the AMI or snapshot.

Each AMI has a `LaunchPermission` attribute that controls which AWS accounts can access the AMI. For more information, see [Make an AMI public](#).

Each Amazon EBS snapshot has a `createVolumePermission` attribute that controls which AWS accounts can use the snapshot. For more information, see [Share an Amazon EBS snapshot](#) in the *Amazon EBS User Guide*.

IAM and Amazon EC2

IAM enables you to do the following:

- Create users and groups under your AWS account
- Assign unique security credentials to each user under your AWS account

- Control each user's permissions to perform tasks using AWS resources
- Allow the users in another AWS account to share your AWS resources
- Create roles for your AWS account and define the users or services that can assume them
- Use existing identities for your enterprise to grant permissions to perform tasks using AWS resources

By using IAM with Amazon EC2, you can control whether users in your organization can perform a task using specific Amazon EC2 API actions and whether they can use specific AWS resources.

This topic helps you answer the following questions:

- How do I create groups and users in IAM?
- How do I create a policy?
- What IAM policies do I need to carry out tasks in Amazon EC2?
- How do I grant permissions to perform actions in Amazon EC2?
- How do I grant permissions to perform actions on specific resources in Amazon EC2?

Create users, groups, and roles

You can create users and groups for your AWS account and then assign them the permissions they require. As a best practice, users should acquire the permissions by assuming IAM roles. For more information on how to set up users and groups for your AWS account, see [Set up to use Amazon EC2](#).

An [IAM role](#) is an IAM identity that you can create in your account that has specific permissions. An IAM role is similar to an IAM user in that it is an AWS identity with permissions policies that determine what the identity can and cannot do in AWS. However, instead of being uniquely associated with one person, a role is intended to be assumable by anyone who needs it. Also, a role does not have standard long-term credentials such as a password or access keys associated with it. Instead, when you assume a role, it provides you with temporary security credentials for your role session. For more information on how to create IAM roles and grant permissions with them, see [IAM roles for Amazon EC2](#).

Related topics

For more information about IAM, see the following:

- [IAM policies for Amazon EC2](#)
- [IAM roles for Amazon EC2](#)
- [AWS Identity and Access Management \(IAM\)](#)
- [IAM User Guide](#)

IAM policies for Amazon EC2

By default, users don't have permission to create or modify Amazon EC2 resources, or perform tasks using the Amazon EC2 API, Amazon EC2 console, or CLI. To allow users to create or modify resources and perform tasks, you must create IAM policies that grant users permission to use the specific resources and API actions they'll need, and then attach those policies to the users, groups, or IAM roles that require those permissions.

When you attach a policy to a user, group of users, or role it allows or denies the users permission to perform the specified tasks on the specified resources. For more general information about IAM policies, see [Policies and permissions in IAM](#) in the *IAM User Guide*. For more information about managing and creating custom IAM policies, see [Managing IAM policies](#).

Getting Started

An IAM policy must grant or deny permissions to use one or more Amazon EC2 actions. It must also specify the resources that can be used with the action, which can be all resources, or in some cases, specific resources. The policy can also include conditions that you apply to the resource.

Amazon EC2 partially supports resource-level permissions. This means that for some EC2 API actions, you cannot specify which resource a user is allowed to work with for that action. Instead, you have to allow users to work with all resources for that action.

Task	Topic
Understand the basic structure of a policy	Policy syntax
Define actions in your policy	Actions for Amazon EC2
Define specific resources in your policy	Amazon Resource Names (ARNs) for Amazon EC2
Apply conditions to the use of the resources	Condition keys for Amazon EC2

Task	Topic
Work with the available resource-level permissions for Amazon EC2	Actions, resources, and condition keys for Amazon EC2
Test your policy	Check that users have the required permissions
Generate an IAM policy	Generate policies based on access activity
Example policies for a CLI or SDK	Example policies for working with the AWS CLI or an AWS SDK
Example policies for the Amazon EC2 console	Example policies for working in the Amazon EC2 console

Grant permissions to users, groups, and roles

The following are examples of some AWS managed policies that are available to utilize if they meet your needs:

- PowerUserAccess
- ReadOnlyAccess
- AmazonEC2FullAccess
- AmazonEC2ReadOnlyAccess

For more information on the AWS managed policies available to work with Amazon EC2, see [AWS managed policies for Amazon Elastic Compute Cloud](#).

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center User Guide*.

- Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.

- IAM users:

- Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.
- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

Policy structure

The following topics explain the structure of an IAM policy.

Contents

- [Policy syntax](#)
- [Actions for Amazon EC2](#)
- [Supported resource-level permissions for Amazon EC2 API actions](#)
- [Amazon Resource Names \(ARNs\) for Amazon EC2](#)
- [Condition keys for Amazon EC2](#)
- [Check that users have the required permissions](#)

Policy syntax

An IAM policy is a JSON document that consists of one or more statements. Each statement is structured as follows.

```
{  
  "Statement": [  
    {  
      "Effect": "effect",  
      "Action": "action",  
      "Resource": "arn",  
      "Condition": {  
        "condition": {  
          "key": "value"  
        }  
      }  
    }  
  ]  
}
```

```
    ]  
}
```

There are various elements that make up a statement:

- **Effect:** The *effect* can be Allow or Deny. By default, users don't have permission to use resources and API actions, so all requests are denied. An explicit allow overrides the default. An explicit deny overrides any allows.
- **Action:** The *action* is the specific API action for which you are granting or denying permission. To learn about specifying *action*, see [Actions for Amazon EC2](#).
- **Resource:** The resource that's affected by the action. Some Amazon EC2 API actions allow you to include specific resources in your policy that can be created or modified by the action. You specify a resource using an Amazon Resource Name (ARN) or using the wildcard (*) to indicate that the statement applies to all resources. For more information, see [Supported resource-level permissions for Amazon EC2 API actions](#).
- **Condition:** Conditions are optional. They can be used to control when your policy is in effect. For more information about specifying conditions for Amazon EC2, see [Condition keys for Amazon EC2](#).

For more information about policy requirements, see the [IAM JSON policy reference](#) in the *IAM User Guide*. For example IAM policy statements for Amazon EC2, see [Example policies for working with the AWS CLI or an AWS SDK](#).

Actions for Amazon EC2

In an IAM policy statement, you can specify any API action from any service that supports IAM. For Amazon EC2, use the following prefix with the name of the API action: ec2:. For example: ec2:RunInstances and ec2:CreateImage.

To specify multiple actions in a single statement, separate them with commas as follows:

```
"Action": ["ec2:action1", "ec2:action2"]
```

You can also specify multiple actions using wildcards. For example, you can specify all actions whose name begins with the word "Describe" as follows:

```
"Action": "ec2:Describe*"
```

Note

Currently, the Amazon EC2 Describe* API actions do not support resource-level permissions. For more information about resource-level permissions for Amazon EC2, see [IAM policies for Amazon EC2](#).

To specify all Amazon EC2 API actions, use the * wildcard as follows:

```
"Action": "ec2:*
```

For a list of Amazon EC2 actions, see [Actions defined by Amazon EC2](#) in the *Service Authorization Reference*.

Supported resource-level permissions for Amazon EC2 API actions

Resource-level permissions refers to the ability to specify which resources users are allowed to perform actions on. Amazon EC2 has partial support for resource-level permissions. This means that for certain Amazon EC2 actions, you can control when users are allowed to use those actions based on conditions that have to be fulfilled, or specific resources that users are allowed to use. For example, you can grant users permissions to launch instances, but only of a specific type, and only using a specific AMI.

To specify a resource in an IAM policy statement, use its Amazon Resource Name (ARN). For more information about specifying the ARN value, see [Amazon Resource Names \(ARNs\) for Amazon EC2](#). If an API action does not support individual ARNs, you must use a wildcard (*) to specify that all resources can be affected by the action.

To see tables that identify which Amazon EC2 API actions support resource-level permissions, and the ARNs and condition keys that you can use in a policy, see [Actions, resources, and condition keys for Amazon EC2](#).

Keep in mind that you can apply tag-based resource-level permissions in the IAM policies you use for Amazon EC2 API actions. This gives you better control over which resources a user can create, modify, or use. For more information, see [Grant permission to tag resources during creation](#).

Amazon Resource Names (ARNs) for Amazon EC2

Each IAM policy statement applies to the resources that you specify using their ARNs.

An ARN has the following general syntax:

```
arn:aws:[service]:[region]:[account-id]:resourceType/resourcePath
```

service

The service (for example, ec2).

region

The Region for the resource (for example, us-east-1).

account-id

The AWS account ID, with no hyphens (for example, 123456789012).

resourceType

The type of resource (for example, instance).

resourcePath

A path that identifies the resource. You can use the * wildcard in your paths.

For example, you can indicate a specific instance (i-1234567890abcdef0) in your statement using its ARN as follows.

```
"Resource": "arn:aws:ec2:us-east-1:123456789012:instance/i-1234567890abcdef0"
```

You can specify all instances that belong to a specific account by using the * wildcard as follows.

```
"Resource": "arn:aws:ec2:us-east-1:123456789012:instance/*"
```

You can also specify all Amazon EC2 resources that belong to a specific account by using the * wildcard as follows.

```
"Resource": "arn:aws:ec2:us-east-1:123456789012:/*"
```

To specify all resources, or if a specific API action does not support ARNs, use the * wildcard in the Resource element as follows.

```
"Resource": "*"
```

Many Amazon EC2 API actions involve multiple resources. For example, `AttachVolume` attaches an Amazon EBS volume to an instance, so a user must have permissions to use the volume and the instance. To specify multiple resources in a single statement, separate their ARNs with commas, as follows.

```
"Resource": ["arn1", "arn2"]
```

For a list of ARNs for Amazon EC2 resources, see [Resource types defined by Amazon EC2](#).

Condition keys for Amazon EC2

In a policy statement, you can optionally specify conditions that control when it is in effect. Each condition contains one or more key-value pairs. Condition keys are not case-sensitive. We've defined AWS global condition keys, plus additional service-specific condition keys.

For a list of service-specific condition keys for Amazon EC2, see [Condition keys for Amazon EC2](#). Amazon EC2 also implements the AWS global condition keys. For more information, see [Information available in all requests](#) in the *IAM User Guide*.

To use a condition key in your IAM policy, use the `Condition` statement. For example, the following policy grants users permission to add and remove inbound and outbound rules for any security group. It uses the `ec2:Vpc` condition key to specify that these actions can only be performed on security groups in a specific VPC.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:AuthorizeSecurityGroupIngress",
        "ec2:AuthorizeSecurityGroupEgress",
        "ec2:RevokeSecurityGroupIngress",
        "ec2:RevokeSecurityGroupEgress"
      ],
      "Resource": "arn:aws:ec2:region:account:security-group/*",
      "Condition": {
        "StringEquals": {
          "ec2:Vpc": "arn:aws:ec2:region:account:vpc/vpc-11223344556677889"
        }
      }
    }
  ]
}
```

```
    }  
]  
}
```

If you specify multiple conditions, or multiple keys in a single condition, we evaluate them using a logical AND operation. If you specify a single condition with multiple values for one key, we evaluate the condition using a logical OR operation. For permissions to be granted, all conditions must be met.

You can also use placeholders when you specify conditions. For more information, see [IAM policy elements: Variables and tags](#) in the *IAM User Guide*.

Important

Many condition keys are specific to a resource, and some API actions use multiple resources. If you write a policy with a condition key, use the Resource element of the statement to specify the resource to which the condition key applies. If not, the policy may prevent users from performing the action at all, because the condition check fails for the resources to which the condition key does not apply. If you do not want to specify a resource, or if you've written the Action element of your policy to include multiple API actions, then you must use the `...IfExists` condition type to ensure that the condition key is ignored for resources that do not use it. For more information, see [...IfExists Conditions](#) in the *IAM User Guide*.

All Amazon EC2 actions support the `aws:RequestedRegion` and `ec2:Region` condition keys. For more information, see [Example: Restrict access to a specific Region](#).

ec2:SourceInstanceARN condition key

The `ec2:SourceInstanceARN` condition key can be used for conditions that specify the ARN of the instance from which a request is made. This is an AWS global condition key and is not service-specific. For policy examples, see [Amazon EC2: Attach or detach volumes to an EC2 instance](#) and [Example: Allow a specific instance to view resources in other AWS services](#).

The `ec2:SourceInstanceARN` key cannot be used as a variable to populate the ARN for the Resource element in a statement.

For example policy statements for Amazon EC2, see [Example policies for working with the AWS CLI or an AWS SDK](#).

ec2:Attribute condition key

The ec2:Attribute condition key can be used for conditions that filter access by an attribute of a resource. The condition key supports only properties that are of a primitive data type (such as a string or integer), or complex [AttributeValue](#) objects that have only a **Value** property (such as the **Description** or **ImdsSupport** objects of the [ModifyImageAttribute](#) API action).

Important

The condition key can't be used with complex objects that have multiple properties, such as the **LaunchPermission** object of the [ModifyImageAttribute](#) API action.

For example, the following policy uses the ec2:Attribute/**Description** condition key to filter access by the complex **Description** object of the **ModifyImageAttribute** API action. The condition key allows only requests that modify an image's description to either **Production** or **Development**.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:ModifyImageAttribute",
            "Resource": "arn:aws:ec2:us-east-1::image/ami-*",
            "Condition": {
                "StringEquals": {
                    "ec2:Attribute/Description": [
                        "Production",
                        "Development"
                    ]
                }
            }
        }
    ]
}
```

The following example policy uses the ec2:Attribute condition key to filter access by the primitive **Attribute** property of the **ModifyImageAttribute** API action. The condition key denies all requests that attempt to modify an image's description.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Deny",  
            "Action": "ec2:ModifyImageAttribute",  
            "Resource": "arn:aws:ec2:us-east-1::image/ami-*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:Attribute": "Description"  
                }  
            }  
        }  
    ]  
}
```

ec2:ResourceID condition keys

When using the following ec2:*Resource* ID condition keys with the specified API actions, the condition key value is used to specify the resulting resource that is created by the API action. ec2:*Resource* ID condition keys can't be used to specify a source resource that is specified in the API request. If you use one of the following ec2:*Resource* ID condition keys with a specified API, then you must always specify the wildcard (*). If you specify a different value, the condition always resolves to * during runtime. For example, to use the ec2:ImageId condition key with the **CopyImage** API, then you must specify the condition key as follows:

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CopyImage",  
            "Resource": "arn:aws:ec2:us-east-1::image/ami-*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:ImageID": "*"  
                }  
            }  
        }  
    ]  
}
```

Condition key	API action
ec2:DhcpOptionsID	<ul style="list-style-type: none">CreateDhcpOptions
ec2:ImageID	<ul style="list-style-type: none">CopyImageCreateImageImportImageRegisterImage
ec2:InstanceID	<ul style="list-style-type: none">RunInstancesImportInstance
ec2:InternetGatewayID	<ul style="list-style-type: none">CreateInternetGateway
ec2:NetworkAclID	<ul style="list-style-type: none">CreateNetworkAcl
ec2:NetworkInterfaceID	<ul style="list-style-type: none">CreateNetworkInterface

Condition key	API action
ec2:PlacementGroupName	<ul style="list-style-type: none">CreatePlacementGroup
ec2:RouteTableID	<ul style="list-style-type: none">CreateRouteTable
ec2:SecurityGroupID	<ul style="list-style-type: none">CreateSecurityGroup
ec2:SnapshotID	<ul style="list-style-type: none">CopySnapshotCreateSnapshotCreateSnapshotsImportSnapshots
ec2:SubnetID	<ul style="list-style-type: none">CreateSubnet
ec2:VolumeID	<ul style="list-style-type: none">CreateVolumeImportVolume

Condition key	API action
ec2:VpcID	<ul style="list-style-type: none">CreateVpc
ec2:VpcPeeringConnectionID	<ul style="list-style-type: none">CreateVpcPeeringConnection

We recommend that you avoid using `ec2:Resource` ID condition keys with these API actions. Instead, if you need to filter access based on specific resource IDs, we recommend that you do so using the `Resource` policy element, as follows:

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CopyImage",  
            "Resource": "arn:aws:ec2:us-east-1::image/ami-01234567890abcdef"  
        }  
    ]  
}
```

Check that users have the required permissions

After you've created an IAM policy, we recommend that you check whether it grants users the permissions to use the particular API actions and resources they need before you put the policy into production.

First, create a user for testing purposes, and then attach the IAM policy that you created to the test user. Then, make a request as the test user.

If the Amazon EC2 action that you are testing creates or modifies a resource, you should make the request using the `DryRun` parameter (or run the AWS CLI command with the `--dry-run`

option). In this case, the call completes the authorization check, but does not complete the operation. For example, you can check whether the user can terminate a particular instance without actually terminating it. If the test user has the required permissions, the request returns `DryRunOperation`; otherwise, it returns `UnauthorizedOperation`.

If the policy doesn't grant the user the permissions that you expected, or is overly permissive, you can adjust the policy as needed and retest until you get the desired results.

Important

It can take several minutes for policy changes to propagate before they take effect.

Therefore, we recommend that you allow five minutes to pass before you test your policy updates.

If an authorization check fails, the request returns an encoded message with diagnostic information. You can decode the message using the `DecodeAuthorizationMessage` action. For more information, see [DecodeAuthorizationMessage](#) in the *AWS Security Token Service API Reference*, and [decode-authorization-message](#) in the *AWS CLI Command Reference*.

Grant permission to tag resources during creation

Some resource-creating Amazon EC2 API actions enable you to specify tags when you create the resource. You can use resource tags to implement attribute-based control (ABAC). For more information, see [Tag your resources](#) and [Control access to EC2 resources using resource tags](#).

To enable users to tag resources on creation, they must have permissions to use the action that creates the resource, such as `ec2:RunInstances` or `ec2>CreateVolume`. If tags are specified in the resource-creating action, Amazon performs additional authorization on the `ec2:CreateTags` action to verify if users have permissions to create tags. Therefore, users must also have explicit permissions to use the `ec2:CreateTags` action.

In the IAM policy definition for the `ec2:CreateTags` action, use the `Condition` element with the `ec2:CreateAction` condition key to give tagging permissions to the action that creates the resource.

The following example demonstrates a policy that allows users to launch instances and apply any tags to instances and volumes during launch. Users are not permitted to tag any existing resources (they cannot call the `ec2:CreateTags` action directly).

```
{  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": [  
        "ec2:RunInstances"  
      ],  
      "Resource": "*"  
    },  
    {  
      "Effect": "Allow",  
      "Action": [  
        "ec2:CreateTags"  
      ],  
      "Resource": "arn:aws:ec2:region:account:*/*",  
      "Condition": {  
        "StringEquals": {  
          "ec2:CreateAction" : "RunInstances"  
        }  
      }  
    }  
  ]  
}
```

Similarly, the following policy allows users to create volumes and apply any tags to the volumes during volume creation. Users are not permitted to tag any existing resources (they cannot call the `ec2:CreateTags` action directly).

```
{  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": [  
        "ec2>CreateVolume"  
      ],  
      "Resource": "*"  
    },  
    {  
      "Effect": "Allow",  
      "Action": [  
        "ec2:CreateTags"  
      ],  
      "Resource": "*"  
    }  
  ]  
}
```

```
"Resource": "arn:aws:ec2:region:account:/*",
"Condition": [
    "StringEquals": [
        "ec2:CreateAction" : "CreateVolume"
    ]
]
```

The `ec2:CreateTags` action is only evaluated if tags are applied during the resource-creating action. Therefore, a user that has permissions to create a resource (assuming there are no tagging conditions) does not require permissions to use the `ec2:CreateTags` action if no tags are specified in the request. However, if the user attempts to create a resource with tags, the request fails if the user does not have permissions to use the `ec2:CreateTags` action.

The `ec2:CreateTags` action is also evaluated if tags are provided in a launch template. For an example policy, see [Tags in a launch template](#).

Control access to specific tags

You can use additional conditions in the `Condition` element of your IAM policies to control the tag keys and values that can be applied to resources.

The following condition keys can be used with the examples in the preceding section:

- `aws:RequestTag`: To indicate that a particular tag key or tag key and value must be present in a request. Other tags can also be specified in the request.
- Use with the `StringEquals` condition operator to enforce a specific tag key and value combination, for example, to enforce the tag `cost-center=cc123`:

```
"StringEquals": { "aws:RequestTag/cost-center": "cc123" }
```

- Use with the `StringLike` condition operator to enforce a specific tag key in the request; for example, to enforce the tag key `purpose`:

```
"StringLike": { "aws:RequestTag/purpose": "*" }
```

- `aws:TagKeys`: To enforce the tag keys that are used in the request.

- Use with the `ForAllValues` modifier to enforce specific tag keys if they are provided in the request (if tags are specified in the request, only specific tag keys are allowed; no other tags are allowed). For example, the tag keys `environment` or `cost-center` are allowed:

```
"ForAllValues:StringEquals": { "aws:TagKeys": ["environment", "cost-center"] }
```

- Use with the `ForAnyValue` modifier to enforce the presence of at least one of the specified tag keys in the request. For example, at least one of the tag keys `environment` or `webserver` must be present in the request:

```
"ForAnyValue:StringEquals": { "aws:TagKeys": ["environment", "webserver"] }
```

These condition keys can be applied to resource-creating actions that support tagging, as well as the `ec2:CreateTags` and `ec2:DeleteTags` actions. To learn whether an Amazon EC2 API action supports tagging, see [Actions, resources, and condition keys for Amazon EC2](#).

To force users to specify tags when they create a resource, you must use the `aws:RequestTag` condition key or the `aws:TagKeys` condition key with the `ForAnyValue` modifier on the resource-creating action. The `ec2:CreateTags` action is not evaluated if a user does not specify tags for the resource-creating action.

For conditions, the condition key is not case-sensitive and the condition value is case-sensitive. Therefore, to enforce the case-sensitivity of a tag key, use the `aws:TagKeys` condition key, where the tag key is specified as a value in the condition.

For example IAM policies, see [Example policies for working with the AWS CLI or an AWS SDK](#). For more information about multi-value conditions, see [Creating a Condition That Tests Multiple Key Values](#) in the *IAM User Guide*.

Control access to EC2 resources using resource tags

When you create an IAM policy that grants users permission to use EC2 resources, you can include tag information in the Condition element of the policy to control access based on tags. This is known as attribute-based access control (ABAC). ABAC provides better control over which resources a user can modify, use, or delete. For more information, see [What is ABAC for AWS?](#)

For example, you can create a policy that allows users to terminate an instance, but denies the action if the instance has the tag `environment=production`. To do this, you use the

aws:ResourceTag condition key to allow or deny access to the resource based on the tags that are attached to the resource.

```
"StringEquals": { "aws:ResourceTag/environment": "production" }
```

To learn whether an Amazon EC2 API action supports controlling access using the aws:ResourceTag condition key, see [Actions, resources, and condition keys for Amazon EC2](#). Note that the Describe actions do not support resource-level permissions, so you must specify them in a separate statement without conditions.

For example IAM policies, see [Example policies for working with the AWS CLI or an AWS SDK](#).

If you allow or deny users access to resources based on tags, you must consider explicitly denying users the ability to add those tags to or remove them from the same resources. Otherwise, it's possible for a user to circumvent your restrictions and gain access to a resource by modifying its tags.

Example policies for working with the AWS CLI or an AWS SDK

You must grant users the permissions they require for Amazon EC2 using IAM policies. The following examples show policy statements that you could use to control the permissions that users have to Amazon EC2. These policies are designed for requests that are made with the AWS CLI or an AWS SDK. For more information, see [Creating IAM policies](#) in the IAM User Guide. For example policies for working in the Amazon EC2 console, see [Example policies for working in the Amazon EC2 console](#). For examples of IAM policies specific to Amazon VPC, see [Identity and Access Management for Amazon VPC](#).

In the following examples, replace each *user input placeholder* with your own information.

Examples

- [Example: Read-only access](#)
- [Example: Restrict access to a specific Region](#)
- [Work with instances](#)
- [Launch instances \(RunInstances\)](#)
- [Work with Spot Instances](#)
- [Example: Work with Reserved Instances](#)
- [Example: Tag resources](#)
- [Example: Work with IAM roles](#)

- [Example: Work with route tables](#)
- [Example: Allow a specific instance to view resources in other AWS services](#)
- [Example: Work with launch templates](#)
- [Work with instance metadata](#)
- [Work with Amazon EBS volumes and snapshots](#)

Example: Read-only access

The following policy grants users permissions to use all Amazon EC2 API actions whose names begin with `Describe`. The `Resource` element uses a wildcard to indicate that users can specify all resources with these API actions. The `*` wildcard is also necessary in cases where the API action does not support resource-level permissions. For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

Users don't have permission to perform any actions on the resources (unless another statement grants them permission to do so) because they're denied permission to use API actions by default.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:Describe*",  
            "Resource": "*"  
        }  
    ]  
}
```

Example: Restrict access to a specific Region

The following policy denies users permission to use all Amazon EC2 API actions unless the Region is Europe (Frankfurt). It uses the global condition key `aws:RequestedRegion`, which is supported by all Amazon EC2 API actions.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Deny",  
            "Condition": {  
                "aws:RequestedRegion": "  
                    ! = Frankfurt"  
            }  
        }  
    ]  
}
```

```
"Action": "ec2:*",
"Resource": "*",
"Condition": {
    "StringNotEquals": {
        "aws:RequestedRegion": "eu-central-1"
    }
}
]
}
```

Alternatively, you can use the condition key `ec2:Region`, which is specific to Amazon EC2 and is supported by all Amazon EC2 API actions.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "ec2:*",
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "ec2:Region": "eu-central-1"
                }
            }
        }
    ]
}
```

Work with instances

Examples

- [Example: Describe, launch, stop, start, and terminate all instances](#)
- [Example: Describe all instances, and stop, start, and terminate only particular instances](#)

Example: Describe, launch, stop, start, and terminate all instances

The following policy grants users permissions to use the API actions specified in the `Action` element. The `Resource` element uses a `*` wildcard to indicate that users can specify all resources with these API actions. The `*` wildcard is also necessary in cases where the API action does not

support resource-level permissions. For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

The users don't have permission to use any other API actions (unless another statement grants them permission to do so) because users are denied permission to use API actions by default.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeInstances",  
                "ec2:DescribeImages",  
                "ec2:DescribeKeyPairs",  
                "ec2:DescribeSecurityGroups",  
                "ec2:DescribeAvailabilityZones",  
                "ec2:RunInstances",  
                "ec2:TerminateInstances",  
                "ec2:StopInstances",  
                "ec2:StartInstances"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

Example: Describe all instances, and stop, start, and terminate only particular instances

The following policy allows users to describe all instances, to start and stop only instances i-1234567890abcdef0 and i-0598c7d356eba48d7, and to terminate only instances in the US East (N. Virginia) Region (us-east-1) with the resource tag "purpose=test".

The first statement uses a * wildcard for the Resource element to indicate that users can specify all resources with the action; in this case, they can list all instances. The * wildcard is also necessary in cases where the API action does not support resource-level permissions (in this case, ec2:DescribeInstances). For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

The second statement uses resource-level permissions for the StopInstances and StartInstances actions. The specific instances are indicated by their ARNs in the Resource element.

The third statement allows users to terminate all instances in the US East (N. Virginia) Region (us-east-1) that belong to the specified AWS account, but only where the instance has the tag "purpose=test". The Condition element qualifies when the policy statement is in effect.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:DescribeInstances",  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:StopInstances",  
                "ec2:StartInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:us-east-1:account-id:instance/i-1234567890abcdef0",  
                "arn:aws:ec2:us-east-1:account-id:instance/i-0598c7d356eba48d7"  
            ]  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:TerminateInstances",  
            "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/purpose": "test"  
                }  
            }  
        }  
    ]  
}
```

Launch instances (RunInstances)

The [RunInstances](#) API action launches one or more On-Demand Instances or one or more Spot Instances. RunInstances requires an AMI and creates an instance. Users can specify a key pair and security group in the request. Launching into a VPC requires a subnet, and creates a network

interface. Launching from an Amazon EBS-backed AMI creates a volume. Therefore, the user must have permissions to use these Amazon EC2 resources. You can create a policy statement that requires users to specify an optional parameter on RunInstances, or restricts users to particular values for a parameter.

For more information about the resource-level permissions that are required to launch an instance, see [Actions, resources, and condition keys for Amazon EC2](#).

By default, users don't have permissions to describe, start, stop, or terminate the resulting instances. One way to grant the users permission to manage the resulting instances is to create a specific tag for each instance, and then create a statement that enables them to manage instances with that tag. For more information, see [Work with instances](#).

Resources

- [AMIs](#)
- [Instance types](#)
- [Subnets](#)
- [EBS volumes](#)
- [Tags](#)
- [Tags in a launch template](#)
- [Elastic GPUs](#)
- [Launch templates](#)

AMIs

The following policy allows users to launch instances using only the specified AMIs, ami-9e1670f7 and ami-45cf5c3c. The users can't launch an instance using other AMIs (unless another statement grants the users permission to do so).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region::image/ami-9e1670f7",  
                "arn:aws:ec2:region::image/ami-45cf5c3c",  
            ]  
        }  
    ]  
}
```

```
    "arn:aws:ec2:region:account-id:instance/*",
    "arn:aws:ec2:region:account-id:volume/*",
    "arn:aws:ec2:region:account-id:key-pair/*",
    "arn:aws:ec2:region:account-id:security-group/*",
    "arn:aws:ec2:region:account-id:subnet/*",
    "arn:aws:ec2:region:account-id:network-interface/*"
]
}
]
}
```

Alternatively, the following policy allows users to launch instances from all AMIs owned by Amazon, or certain trusted and verified partners. The Condition element of the first statement tests whether ec2:Owner is amazon. The users can't launch an instance using other AMIs (unless another statement grants the users permission to do so).

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:RunInstances",
      "Resource": [
        "arn:aws:ec2:region::image/ami-*"
      ],
      "Condition": {
        "StringEquals": {
          "ec2:Owner": "amazon"
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": "ec2:RunInstances",
      "Resource": [
        "arn:aws:ec2:region:account-id:instance/*",
        "arn:aws:ec2:region:account-id:subnet/*",
        "arn:aws:ec2:region:account-id:volume/*",
        "arn:aws:ec2:region:account-id:network-interface/*",
        "arn:aws:ec2:region:account-id:key-pair/*",
        "arn:aws:ec2:region:account-id:security-group/*"
      ]
    }
}
```

```
]  
}
```

Instance types

The following policy allows users to launch instances using only the `t2.micro` or `t2.small` instance type, which you might do to control costs. The users can't launch larger instances because the Condition element of the first statement tests whether `ec2:InstanceType` is either `t2.micro` or `t2.small`.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region:account-id:instance/*"  
            ],  
            "Condition": {  
                "StringEquals": {  
                    "ec2:InstanceType": ["t2.micro", "t2.small"]  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region::image/ami-*",  
                "arn:aws:ec2:region:account-id:subnet/*",  
                "arn:aws:ec2:region:account-id:network-interface/*",  
                "arn:aws:ec2:region:account-id:volume/*",  
                "arn:aws:ec2:region:account-id:key-pair/*",  
                "arn:aws:ec2:region:account-id:security-group/*"  
            ]  
        }  
    ]  
}
```

Alternatively, you can create a policy that denies users permissions to launch any instances except `t2.micro` and `t2.small` instance types.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Deny",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region:account-id:instance/*"  
            ],  
            "Condition": {  
                "StringNotEquals": {  
                    "ec2:InstanceType": ["t2.micro", "t2.small"]  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region::image/ami-*",  
                "arn:aws:ec2:region:account-id:network-interface/*",  
                "arn:aws:ec2:region:account-id:instance/*",  
                "arn:aws:ec2:region:account-id:subnet/*",  
                "arn:aws:ec2:region:account-id:volume/*",  
                "arn:aws:ec2:region:account-id:key-pair/*",  
                "arn:aws:ec2:region:account-id:security-group/*"  
            ]  
        }  
    ]  
}
```

Subnets

The following policy allows users to launch instances using only the specified subnet, **subnet-12345678**. The group can't launch instances into any another subnet (unless another statement grants the users permission to do so).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region:account-id:subnet/subnet-12345678/*"  
            ]  
        }  
    ]  
}
```

```
"Resource": [
    "arn:aws:ec2:region:account-id:subnet/subnet-12345678",
    "arn:aws:ec2:region:account-id:network-interface/*",
    "arn:aws:ec2:region:account-id:instance/*",
    "arn:aws:ec2:region:account-id:volume/*",
    "arn:aws:ec2:region::image/ami-*",
    "arn:aws:ec2:region:account-id:key-pair/*",
    "arn:aws:ec2:region:account-id:security-group/*"
]
}
]
}
```

Alternatively, you could create a policy that denies users permissions to launch an instance into any other subnet. The statement does this by denying permission to create a network interface, except where subnet subnet-**12345678** is specified. This denial overrides any other policies that are created to allow launching instances into other subnets.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region:account-id:network-interface/*"
            ],
            "Condition": {
                "ArnNotEquals": {
                    "ec2:Subnet": "arn:aws:ec2:region:account-id:subnet/subnet-12345678"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region::image/ami-*",
                "arn:aws:ec2:region:account-id:network-interface/*",
                "arn:aws:ec2:region:account-id:instance/*",
                "arn:aws:ec2:region:account-id:subnet/*",
                "arn:aws:ec2:region:account-id:volume/*",
                "arn:aws:ec2:region:account-id:key-pair/*",
            ]
        }
    ]
}
```

```
    "arn:aws:ec2:region:account-id:security-group/*"
]
}
]
```

EBS volumes

The following policy allows users to launch instances only if the EBS volumes for the instance are encrypted. The user must launch an instance from an AMI that was created with encrypted snapshots, to ensure that the root volume is encrypted. Any additional volume that the user attaches to the instance during launch must also be encrypted.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:RunInstances",
      "Resource": [
        "arn:aws:ec2:*::volume/*"
      ],
      "Condition": {
        "Bool": {
          "ec2:Encrypted": "true"
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": "ec2:RunInstances",
      "Resource": [
        "arn:aws:ec2:::image/ami-*",
        "arn:aws:ec2:::network-interface/*",
        "arn:aws:ec2:::instance/*",
        "arn:aws:ec2:::subnet/*",
        "arn:aws:ec2:::key-pair/*",
        "arn:aws:ec2:::security-group/*"
      ]
    }
  ]
}
```

Tags

Tag instances on creation

The following policy allows users to launch instances and tag the instances during creation. For resource-creating actions that apply tags, users must have permissions to use the `CreateTags` action. The second statement uses the `ec2:CreateAction` condition key to allow users to create tags only in the context of `RunInstances`, and only for instances. Users cannot tag existing resources, and users cannot tag volumes using the `RunInstances` request.

For more information, see [Grant permission to tag resources during creation](#).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:CreateAction" : "RunInstances"  
                }  
            }  
        }  
    ]  
}
```

Tag instances and volumes on creation with specific tags

The following policy includes the `aws:RequestTag` condition key that requires users to tag any instances and volumes that are created by `RunInstances` with the tags

environment=production and purpose=webserver. If users don't pass these specific tags, or if they don't specify tags at all, the request fails.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:region::image/*",  
                "arn:aws:ec2:region:account-id:subnet/*",  
                "arn:aws:ec2:region:account-id:network-interface/*",  
                "arn:aws:ec2:region:account-id:security-group/*",  
                "arn:aws:ec2:region:account-id:key-pair/*"  
            ]  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:region:account-id:volume/*",  
                "arn:aws:ec2:region:account-id:instance/*"  
            ],  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "production" ,  
                    "aws:RequestTag/purpose": "webserver"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2>CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:region:account-id:*/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "production" ,  
                    "aws:RequestTag/purpose": "webserver"  
                }  
            }  
        }  
    ]  
}
```

```
        "ec2:CreateAction" : "RunInstances"
    }
}
]
}
```

Tag instances and volumes on creation with at least one specific tag

The following policy uses the ForAnyValue modifier on the aws:TagKeys condition to indicate that at least one tag must be specified in the request, and it must contain the key environment or webserver. The tag must be applied to both instances and volumes. Any tag values can be specified in the request.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:region::image/*",
                "arn:aws:ec2:region:account-id:subnet/*",
                "arn:aws:ec2:region:account-id:network-interface/*",
                "arn:aws:ec2:region:account-id:security-group/*",
                "arn:aws:ec2:region:account-id:key-pair/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:region:account-id:volume/*",
                "arn:aws:ec2:region:account-id:instance/*"
            ],
            "Condition": {
                "ForAnyValue:StringEquals": {
                    "aws:TagKeys": ["environment", "webserver"]
                }
            }
        }
    ]
}
```

```
        },
      },
      {
        "Effect": "Allow",
        "Action": [
          "ec2:CreateTags"
        ],
        "Resource": "arn:aws:ec2:region:account-id:*//*",
        "Condition": {
          "StringEquals": {
            "ec2:CreateAction" : "RunInstances"
          }
        }
      }
    ]
}
```

If instances are tagged on creation, they must be tagged with a specific tag

In the following policy, users do not have to specify tags in the request, but if they do, the tag must be purpose=test. No other tags are allowed. Users can apply the tags to any taggable resource in the RunInstances request.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:RunInstances"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "ec2:CreateTags"
      ],
      "Resource": "arn:aws:ec2:region:account-id:*//*",
      "Condition": {
        "StringEquals": {
          "aws:RequestTag/purpose": "test",
          "ec2:CreateAction" : "RunInstances"
        }
      }
    }
  ]
}
```

```
        },
        "ForAllValues:StringEquals": {
            "aws:TagKeys": "purpose"
        }
    }
]
}
```

To disallow anyone called tag on create for RunInstances

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1::subnet/*",
                "arn:aws:ec2:us-east-1::network-interface/*",
                "arn:aws:ec2:us-east-1::security-group/*",
                "arn:aws:ec2:us-east-1::key-pair/*",
                "arn:aws:ec2:us-east-1::volume/*",
                "arn:aws:ec2:us-east-1::instance/*",
                "arn:aws:ec2:us-east-1::spot-instances-request/*"
            ]
        },
        {
            "Sid": "VisualEditor0",
            "Effect": "Deny",
            "Action": "ec2:CreateTags",
            "Resource": "*"
        }
    ]
}
```

Only allow specific tags for spot-instances-request. Surprise inconsistency number 2 comes into play here. Under normal circumstances, specifying no tags will result in Unauthenticated. In the

case of spot-instances-request, this policy will not be evaluated if there are no spot-instances-request tags, so a non-tag Spot on Run request will succeed.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowRun",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:us-east-1::image/*",  
                "arn:aws:ec2:us-east-1::subnet/*",  
                "arn:aws:ec2:us-east-1::network-interface/*",  
                "arn:aws:ec2:us-east-1::security-group/*",  
                "arn:aws:ec2:us-east-1::key-pair/*",  
                "arn:aws:ec2:us-east-1::volume/*",  
                "arn:aws:ec2:us-east-1::instance/*",  
            ]  
        },  
        {  
            "Sid": "VisualEditor0",  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:us-east-1::spot-instances-request/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "production"  
                }  
            }  
        }  
    ]  
}
```

Tags in a launch template

In the following example, users can launch instances, but only if they use a specific launch template (lt-09477bcd97b0d310e). The ec2:IsLaunchTemplateResource condition key prevents users from overriding any of the resources specified in the launch template. The second

part of the statement allows users to tag instances on creation—this part of the statement is necessary if tags are specified for the instance in the launch template.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": "*",  
            "Condition": {  
                "ArnLike": {  
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/  
lt-09477bcd97b0d310e"  
                },  
                "Bool": {  
                    "ec2:IsLaunchTemplateResource": "true"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2>CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:region:account-id:instance/*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2>CreateAction" : "RunInstances"  
                }  
            }  
        }  
    ]  
}
```

Elastic GPUs

In the following policy, users can launch an instance and specify an elastic GPU to attach to the instance. Users can launch instances in any Region, but they can only attach an elastic GPU during a launch in the us-east-2 Region.

The `ec2:ElasticGpuType` condition key ensures that instances use either the `eg1.medium` or `eg1.large` elastic GPU type.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:*:account-id:elastic-gpu/*"  
            ],  
            "Condition": {  
                "StringEquals": {  
                    "ec2:Region": "us-east-2",  
                    "ec2:ElasticGpuType": [  
                        "eg1.medium",  
                        "eg1.large"  
                    ]  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:::image/ami-*",  
                "arn:aws:ec2::*:account-id:network-interface/*",  
                "arn:aws:ec2::*:account-id:instance/*",  
                "arn:aws:ec2::*:account-id:subnet/*",  
                "arn:aws:ec2::*:account-id:volume/*",  
                "arn:aws:ec2::*:account-id:key-pair/*",  
                "arn:aws:ec2::*:account-id:security-group/*"  
            ]  
        }  
    ]  
}
```

Launch templates

In the following example, users can launch instances, but only if they use a specific launch template (lt-09477bcd97b0d310e). Users can override any parameters in the launch template by specifying the parameters in the RunInstances action.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": "*",  
            "Condition": {  
                "ArnLike": {  
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/  
lt-09477bcd97b0d310e"  
                }  
            }  
        }  
    ]  
}
```

In this example, users can launch instances only if they use a launch template. The policy uses the `ec2:IsLaunchTemplateResource` condition key to prevent users from overriding any pre-existing ARNs in the launch template.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": "*",  
            "Condition": {  
                "ArnLike": {  
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"  
                },  
                "Bool": {  
                    "ec2:IsLaunchTemplateResource": "true"  
                }  
            }  
        }  
    ]  
}
```

The following example policy allows user to launch instances, but only if they use a launch template. Users cannot override the subnet and network interface parameters in the request; these

parameters can only be specified in the launch template. The first part of the statement uses the [NotResource](#) element to allow all other resources except subnets and network interfaces. The second part of the statement allows the subnet and network interface resources, but only if they are sourced from the launch template.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "NotResource": ["arn:aws:ec2:region:account-id:subnet/*",  
                           "arn:aws:ec2:region:account-id:network-interface/*"],  
            "Condition": {  
                "ArnLike": {  
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": ["arn:aws:ec2:region:account-id:subnet/*",  
                         "arn:aws:ec2:region:account-id:network-interface/*"],  
            "Condition": {  
                "ArnLike": {  
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"  
                },  
                "Bool": {  
                    "ec2:IsLaunchTemplateResource": "true"  
                }  
            }  
        }  
    ]  
}
```

The following example allows users to launch instances only if they use a launch template, and only if the launch template has the tag Purpose=Webservers. Users cannot override any of the launch template parameters in the RunInstances action.

```
{  
    "Version": "2012-10-17",
```

```
"Statement": [
    {
        "Effect": "Allow",
        "Action": "ec2:RunInstances",
        "NotResource": "arn:aws:ec2:region:account-id:launch-template/*",
        "Condition": {
            "ArnLike": {
                "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"
            },
            "Bool": {
                "ec2:IsLaunchTemplateResource": "true"
            }
        }
    },
    {
        "Effect": "Allow",
        "Action": "ec2:RunInstances",
        "Resource": "arn:aws:ec2:region:account-id:launch-template/*",
        "Condition": {
            "StringEquals": {
                "aws:ResourceTag/Purpose": "Webservers"
            }
        }
    }
]
```

Work with Spot Instances

You can use the RunInstances action to create Spot Instance requests, and tag the Spot Instance requests on create. The resource to specify for RunInstances is spot-instances-request.

The spot-instances-request resource is evaluated in the IAM policy as follows:

- If you don't tag a Spot Instance request on create, Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement.
- If you tag a Spot Instance request on create, Amazon EC2 evaluates the spot-instances-request resource in the RunInstances statement.

Therefore, for the spot-instances-request resource, the following rules apply to the IAM policy:

- If you use RunInstances to create a Spot Instance request and you don't intend to tag the Spot Instance request on create, you don't need to explicitly allow the spot-instances-request resource; the call will succeed.
 - If you use RunInstances to create a Spot Instance request and intend to tag the Spot Instance request on create, you must include the spot-instances-request resource in the RunInstances allow statement, otherwise the call will fail.
 - If you use RunInstances to create a Spot Instance request and intend to tag the Spot Instance request on create, you must specify the spot-instances-request resource or * wildcard in the CreateTags allow statement, otherwise the call will fail.

You can request Spot Instances using `RunInstances` or `RequestSpotInstances`. The following example IAM policies apply only when requesting Spot Instances using `RunInstances`.

Example: Request Spot Instances using RunInstances

The following policy allows users to request Spot Instances by using the RunInstances action. The `spotInstancesRequest` resource, which is created by RunInstances, requests Spot Instances.

 Note

To use RunInstances to create Spot Instance requests, you can omit spot-instances-request from the Resource list if you do not intend to tag the Spot Instance requests on create. This is because Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement if the Spot Instance request is not tagged on create.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1::subnet/*"
            ]
        }
    ]
}
```

```
        "arn:aws:ec2:us-east-1:*:network-interface/*",
        "arn:aws:ec2:us-east-1:*:security-group/*",
        "arn:aws:ec2:us-east-1:*:key-pair/*",
        "arn:aws:ec2:us-east-1:*:volume/*",
        "arn:aws:ec2:us-east-1:*:instance/*",
        "arn:aws:ec2:us-east-1:*:spot-instances-request/*"
    ]
}
]
}
```

Warning

NOT SUPPORTED – Example: Deny users permission to request Spot Instances using RunInstances

The following policy is not supported for the spot-instances-request resource.

The following policy is meant to give users the permission to launch On-Demand Instances, but deny users the permission to request Spot Instances. The spot-instances-request resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement is meant to deny the RunInstances action for the spot-instances-request resource. However, this condition is not supported because Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement if the Spot Instance request is not tagged on create.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1:*:subnet/*",
                "arn:aws:ec2:us-east-1:*:network-interface/*",
                "arn:aws:ec2:us-east-1:*:security-group/*",
                "arn:aws:ec2:us-east-1:*:key-pair/*",
                "arn:aws:ec2:us-east-1:*:volume/*",
                "arn:aws:ec2:us-east-1:*:instance/*"
            ]
        }
    ]
}
```

```
        ],
    },
{
    "Sid": "DenySpotInstancesRequests - NOT SUPPORTED - DO NOT USE!",
    "Effect": "Deny",
    "Action": "ec2:RunInstances",
    "Resource": "arn:aws:ec2:us-east-1:*:spot-instances-request/*"
}
]
}
```

Example: Tag Spot Instance requests on create

The following policy allows users to tag all resources that are created during instance launch. The first statement allows RunInstances to create the listed resources. The spot-instances-request resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement provides a * wildcard to allow all resources to be tagged when they are created at instance launch.

Note

If you tag a Spot Instance request on create, Amazon EC2 evaluates the spot-instances-request resource in the RunInstances statement. Therefore, you must explicitly allow the spot-instances-request resource for the RunInstances action, otherwise the call will fail.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1::*:subnet/*",
                "arn:aws:ec2:us-east-1::*:volume/*"
            ]
        }
    ]
}
```

```
        "arn:aws:ec2:us-east-1:*:network-interface/*",
        "arn:aws:ec2:us-east-1:*:security-group/*",
        "arn:aws:ec2:us-east-1:*:key-pair/*",
        "arn:aws:ec2:us-east-1:*:volume/*",
        "arn:aws:ec2:us-east-1:*:instance/*",
        "arn:aws:ec2:us-east-1:*:spot-instances-request/*"
    ],
},
{
    "Sid": "TagResources",
    "Effect": "Allow",
    "Action": "ec2:CreateTags",
    "Resource": "*"
}
]
}
```

Example: Deny tag on create for Spot Instance requests

The following policy denies users the permission to tag the resources that are created during instance launch.

The first statement allows RunInstances to create the listed resources. The spot-instances-request resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement provides a * wildcard to deny all resources being tagged when they are created at instance launch. If spot-instances-request or any other resource is tagged on create, the RunInstances call will fail.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1:*:subnet/*",
                "arn:aws:ec2:us-east-1:*:network-interface/*",
                "arn:aws:ec2:us-east-1:*:security-group/*",
                "arn:aws:ec2:us-east-1:*:key-pair/*",
                "arn:aws:ec2:us-east-1:*:spot-instances-request/*"
            ]
        }
    ]
}
```

```
        "arn:aws:ec2:us-east-1:*:volume/*",
        "arn:aws:ec2:us-east-1:*:instance/*",
        "arn:aws:ec2:us-east-1:*:spot-instances-request/*"
    ],
},
{
    "Sid": "DenyTagResources",
    "Effect": "Deny",
    "Action": "ec2:CreateTags",
    "Resource": "*"
}
]
}
```

Warning

NOT SUPPORTED – Example: Allow creating a Spot Instance request only if it is assigned a specific tag

The following policy is not supported for the spot-instances-request resource.

The following policy is meant to grant RunInstances the permission to create a Spot Instance request only if the request is tagged with a specific tag.

The first statement allows RunInstances to create the listed resources.

The second statement is meant to grant users the permission to create a Spot Instance request only if the request has the tag environment=production. If this condition is applied to other resources created by RunInstances, specifying no tags results in an Unauthenticated error. However, if no tags are specified for the Spot Instance request, Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement, which results in non-tagged Spot Instance requests being created by RunInstances.

Note that specifying another tag other than environment=production results in an Unauthenticated error, because if a user tags a Spot Instance request, Amazon EC2 evaluates the spot-instances-request resource in the RunInstances statement.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:CreateTags"
            ]
        }
    ]
}
```

```
        "ec2:RunInstances"
    ],
    "Resource": [
        "arn:aws:ec2:us-east-1::image/*",
        "arn:aws:ec2:us-east-1::subnet/*",
        "arn:aws:ec2:us-east-1::network-interface/*",
        "arn:aws:ec2:us-east-1::security-group/*",
        "arn:aws:ec2:us-east-1::key-pair/*",
        "arn:aws:ec2:us-east-1::volume/*",
        "arn:aws:ec2:us-east-1::instance/*"
    ]
},
{
    "Sid": "RequestSpotInstancesOnlyIfTagIs_environment=production - NOT SUPPORTED - DO NOT USE!",
    "Effect": "Allow",
    "Action": "ec2:RunInstances",
    "Resource": "arn:aws:ec2:us-east-1::spot-instances-request/*",
    "Condition": {
        "StringEquals": {
            "aws:RequestTag/environment": "production"
        }
    }
},
{
    "Sid": "TagResources",
    "Effect": "Allow",
    "Action": "ec2:CreateTags",
    "Resource": "*"
}

]
}
```

Example: Deny creating a Spot Instance request if it is assigned a specific tag

The following policy denies RunInstances the permission to create a Spot Instance request if the request is tagged with environment=production.

The first statement allows RunInstances to create the listed resources.

The second statement denies users the permission to create a Spot Instance request if the request has the tag environment=production. Specifying environment=production as a tag results in an Unauthorized error. Specifying other tags or specifying no tags will result in the creation of a Spot Instance request.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowRun",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:us-east-1::image/*",  
                "arn:aws:ec2:us-east-1:*:subnet/*",  
                "arn:aws:ec2:us-east-1:*:network-interface/*",  
                "arn:aws:ec2:us-east-1:*:security-group/*",  
                "arn:aws:ec2:us-east-1:*:key-pair/*",  
                "arn:aws:ec2:us-east-1:*:volume/*",  
                "arn:aws:ec2:us-east-1:*:instance/*",  
                "arn:aws:ec2:us-east-1:*:spot-instances-request/*"  
            ]  
        },  
        {  
            "Sid": "DenySpotInstancesRequests",  
            "Effect": "Deny",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:us-east-1:*:spot-instances-request/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "production"  
                }  
            }  
        },  
        {  
            "Sid": "TagResources",  
            "Effect": "Allow",  
            "Action": "ec2:CreateTags",  
            "Resource": "*"  
        }  
    ]  
}
```

{

Example: Work with Reserved Instances

The following policy gives users permission to view, modify, and purchase Reserved Instances in your account.

It is not possible to set resource-level permissions for individual Reserved Instances. This policy means that users have access to all the Reserved Instances in the account.

The Resource element uses a * wildcard to indicate that users can specify all resources with the action; in this case, they can list and modify all Reserved Instances in the account. They can also purchase Reserved Instances using the account credentials. The * wildcard is also necessary in cases where the API action does not support resource-level permissions.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeReservedInstances",  
                "ec2:ModifyReservedInstances",  
                "ec2:PurchaseReservedInstancesOffering",  
                "ec2:DescribeAvailabilityZones",  
                "ec2:DescribeReservedInstancesOfferings"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

To allow users to view and modify the Reserved Instances in your account, but not purchase new Reserved Instances.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeReservedInstances",  
                "ec2:ModifyReservedInstances",  
                "ec2:DescribeAvailabilityZones",  
                "ec2:DescribeReservedInstancesOfferings"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

```
    "ec2:DescribeReservedInstances",
    "ec2:ModifyReservedInstances",
    "ec2:DescribeAvailabilityZones"
],
"Resource": "*"
}
]
}
```

Example: Tag resources

The following policy allows users to use the `CreateTags` action to apply tags to an instance only if the tag contains the key `environment` and the value `production`. No other tags are allowed and the user cannot tag any other resource types.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:CreateTags"
      ],
      "Resource": "arn:aws:ec2:region:account-id:instance/*",
      "Condition": {
        "StringEquals": {
          "aws:RequestTag/environment": "production"
        }
      }
    }
  ]
}
```

The following policy allows users to tag any taggable resource that already has a tag with a key of `owner` and a value of the username. In addition, users must specify a tag with a key of `anycompany:environment-type` and a value of either `test` or `prod` in the request. Users can specify additional tags in the request.

```
{
  "Version": "2012-10-17",
  "Statement": [
```

```
{  
    "Effect": "Allow",  
    "Action": [  
        "ec2:CreateTags"  
    ],  
    "Resource": "arn:aws:ec2:region:account-id:*/*",  
    "Condition": {  
        "StringEquals": {  
            "aws:RequestTag/anycompany:environment-type": ["test", "prod"],  
            "aws:ResourceTag/owner": "${aws:username}"  
        }  
    }  
}  
}
```

You can create an IAM policy that allows users to delete specific tags for a resource. For example, the following policy allows users to delete tags for a volume if the tag keys specified in the request are environment or cost-center. Any value can be specified for the tag but the tag key must match either of the specified keys.

 **Note**

If you delete a resource, all tags associated with the resource are also deleted. Users do not need permissions to use the ec2:DeleteTags action to delete a resource that has tags; they only need permissions to perform the deleting action.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:DeleteTags",  
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",  
            "Condition": {  
                "ForAllValues:StringEquals": {  
                    "aws:TagKeys": ["environment", "cost-center"]  
                }  
            }  
        }  
    ]  
}
```

```
]  
}
```

This policy allows users to delete only the environment=prod tag on any resource, and only if the resource is already tagged with a key of owner and a value of the username. Users can't delete any other tags for a resource.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DeleteTags"  
            ],  
            "Resource": "arn:aws:ec2:region:account-id:/*/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "prod",  
                    "aws:ResourceTag/owner": "${aws:username}"  
                },  
                "ForAllValues:StringEquals": {  
                    "aws:TagKeys": ["environment"]  
                }  
            }  
        }  
    ]  
}
```

Example: Work with IAM roles

The following policy allows users to attach, replace, and detach an IAM role to instances that have the tag department=test. Replacing or detaching an IAM role requires an association ID, therefore the policy also grants users permission to use the ec2:DescribeIamInstanceProfileAssociations action.

Users must have permission to use the iam:PassRole action in order to pass the role to the instance.

```
{  
    "Version": "2012-10-17",
```

```
"Statement": [
    {
        "Effect": "Allow",
        "Action": [
            "ec2:AssociateIamInstanceProfile",
            "ec2:ReplaceIamInstanceProfileAssociation",
            "ec2:DisassociateIamInstanceProfile"
        ],
        "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",
        "Condition": {
            "StringEquals": {
                "aws:ResourceTag/department": "test"
            }
        }
    },
    {
        "Effect": "Allow",
        "Action": "ec2:DescribeIamInstanceProfileAssociations",
        "Resource": "*"
    },
    {
        "Effect": "Allow",
        "Action": "iam:PassRole",
        "Resource": "arn:aws:iam::account-id:role/DevTeam*"
    }
]
```

The following policy allows users to attach or replace an IAM role for any instance. Users can only attach or replace IAM roles with names that begin with TestRole-. For the iam:PassRole action, ensure that you specify the name of the IAM role and not the instance profile (if the names are different). For more information, see [Instance profiles](#).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:AssociateIamInstanceProfile",
                "ec2:ReplaceIamInstanceProfileAssociation"
            ],
            "Resource": "*"
        }
    ]
}
```

```
        },
        {
            "Effect": "Allow",
            "Action": "ec2:DescribeIamInstanceProfileAssociations",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "iam:PassRole",
            "Resource": "arn:aws:iam::account-id:role/TestRole-*"
        }
    ]
}
```

Example: Work with route tables

The following policy allows users to add, remove, and replace routes for route tables that are associated with VPC vpc-ec43eb89 only. To specify a VPC for the ec2:Vpc condition key, you must specify the full ARN of the VPC.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DeleteRoute",
                "ec2>CreateRoute",
                "ec2:ReplaceRoute"
            ],
            "Resource": [
                "arn:aws:ec2:region:account-id:route-table/*"
            ],
            "Condition": {
                "StringEquals": {
                    "ec2:Vpc": "arn:aws:ec2:region:account-id:vpc/vpc-ec43eb89"
                }
            }
        }
    ]
}
```

Example: Allow a specific instance to view resources in other AWS services

The following is an example of a policy that you might attach to an IAM role. The policy allows an instance to view resources in various AWS services. It uses the `ec2:SourceInstanceARN` condition key to specify that the instance from which the request is made must be instance `i-093452212644b0dd6`. If the same IAM role is associated with another instance, the other instance cannot perform any of these actions.

The `ec2:SourceInstanceARN` key is an AWS global condition key, therefore it can be used for other service actions, not just Amazon EC2.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeVolumes",  
                "s3>ListAllMyBuckets",  
                "dynamodb>ListTables",  
                "rds:DescribeDBInstances"  
            ],  
            "Resource": [  
                "*"  
            ],  
            "Condition": {  
                "ArnEquals": {  
                    "ec2:SourceInstanceARN": "arn:aws:ec2:region:account-id:instance/  
i-093452212644b0dd6"  
                }  
            }  
        }  
    ]  
}
```

Example: Work with launch templates

The following policy allows users to create a launch template version and modify a launch template, but only for a specific launch template (`lt-09477bcd97b0d3abc`). Users cannot work with other launch templates.

```
{
```

```
"Version": "2012-10-17",
"Statement": [
{
    "Action": [
        "ec2:CreateLaunchTemplateVersion",
        "ec2:ModifyLaunchTemplate"
    ],
    "Effect": "Allow",
    "Resource": "arn:aws:ec2:region:account-id:launch-template/lt-09477bcd97b0d3abc"
}
]
```

The following policy allows users to delete any launch template and launch template version, provided that the launch template has the tag Purpose=Testing.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Action": [
                "ec2>DeleteLaunchTemplate",
                "ec2>DeleteLaunchTemplateVersions"
            ],
            "Effect": "Allow",
            "Resource": "arn:aws:ec2:region:account-id:launch-template/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/Purpose": "Testing"
                }
            }
        }
    ]
}
```

Work with instance metadata

The following policies ensure that users can only retrieve [instance metadata](#) using Instance Metadata Service Version 2 (IMDSv2). You can combine the following four policies into one policy with four statements. When combined as one policy, you can use the policy as a service control policy (SCP). It can work equally well as a *deny* policy that you apply to an existing IAM policy

(taking away and limiting existing permission), or as an SCP that is applied globally across an account, an organizational unit (OU), or an entire organization.

Note

The following RunInstances metadata options policies must be used in conjunction with a policy that gives the principal permissions to launch an instance with RunInstances. If the principal does not also have RunInstances permissions, it will not be able to launch an instance. For more information, see the policies in [Work with instances](#) and [Launch instances \(RunInstances\)](#).

Important

If you use Auto Scaling groups and you need to require the use of IMDSv2 on all new instances, your Auto Scaling groups must use *launch templates*.

When an Auto Scaling group uses a launch template, the ec2:RunInstances permissions of the IAM principal are checked when a new Auto Scaling group is created. They are also checked when an existing Auto Scaling group is updated to use a new launch template or a new version of a launch template.

Restrictions on the use of IMDSv1 on IAM principals for RunInstances are only checked when an Auto Scaling group that is using a launch template, is created or updated. For an Auto Scaling group that is configured to use the Latest or Default launch template, the permissions are not checked when a new version of the launch template is created. For permissions to be checked, you must configure the Auto Scaling group to use a *specific version* of the launch template.

To enforce the use of IMDSv2 on instances launched by Auto Scaling groups, the following additional steps are required:

1. Disable the use of launch configurations for all accounts in your organization by using either service control policies (SCPs) or IAM permissions boundaries for new principals that are created. For existing IAM principals with Auto Scaling group permissions, update their associated policies with this condition key. To disable the use of launch configurations, create or modify the relevant SCP, permissions boundary, or IAM policy with the "autoscaling:LaunchConfigurationName" condition key with the value specified as null.

2. For new launch templates, configure the instance metadata options in the launch template. For existing launch templates, create a new version of the launch template and configure the instance metadata options in the new version.
3. In the policy that gives any principal the permission to use a launch template, restrict association of \$latest and \$default by specifying "autoscaling:LaunchTemplateVersionSpecified": "true". By restricting the use to a specific version of a launch template, you can ensure that new instances will be launched using the version in which the instance metadata options are configured. For more information, see [LaunchTemplateSpecification](#) in the *Amazon EC2 Auto Scaling API Reference*, specifically the Version parameter.
4. For an Auto Scaling group that uses a launch configuration, replace the launch configuration with a launch template. For more information, see [Replacing a Launch Configuration with a Launch Template](#) in the *Amazon EC2 Auto Scaling User Guide*.
5. For an Auto Scaling group that uses a launch template, make sure that it uses a new launch template with the instance metadata options configured, or uses a new version of the current launch template with the instance metadata options configured. For more information, see [update-auto-scaling-group](#) in the *AWS CLI Command Reference*.

Examples

- [Require the use of IMDSv2](#)
- [Deny opt-out of IMDSv2](#)
- [Specify maximum hop limit](#)
- [Limit who can modify the instance metadata options](#)
- [Require role credentials to be retrieved from IMDSv2](#)

Require the use of IMDSv2

The following policy specifies that you can't call the RunInstances API unless the instance is also opted in to require the use of IMDSv2 (indicated by "ec2:MetadataHttpTokens": "required"). If you do not specify that the instance requires IMDSv2, you get an UnauthorizedOperation error when you call the RunInstances API.

```
{  
    "Version": "2012-10-17",
```

```
"Statement": [
    {
        "Sid": "RequireImdsV2",
        "Effect": "Deny",
        "Action": "ec2:RunInstances",
        "Resource": "arn:aws:ec2:*.*:instance/*",
        "Condition": {
            "StringNotEquals": {
                "ec2:MetadataHttpTokens": "required"
            }
        }
    }
]
```

Deny opt-out of IMDSv2

The following policy specifies that you cannot call the `ModifyInstanceMetadataOptions` API and allow the option of IMDSv1 or IMDSv2. If you call the `ModifyInstanceMetadataOptions` API, the `HttpTokens` attribute must be set to `required`.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "DenyIMDSv1HttpTokensModification",
            "Effect": "Deny",
            "Action": "ec2:ModifyInstanceMetadataOptions",
            "Resource": "arn:aws:ec2:*.*:instance/*",
            "Condition": {
                "StringNotEquals": {
                    "ec2:Attribute/HttpTokens": "required"
                },
                "Null": {
                    "ec2:Attribute/HttpTokens": false
                }
            }
        }
    ]
}
```

Specify maximum hop limit

The following policy specifies that you can't call the RunInstances API unless you also specify a hop limit, and the hop limit can't be more than 3. If you fail to do that, you get an UnauthorizedOperation error when you call the RunInstances API.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "MaxImdsHopLimit",  
            "Effect": "Deny",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:*::instance/*",  
            "Condition": {  
                "NumericGreaterThan": {  
                    "ec2:MetadataHttpPutResponseHopLimit": "3"  
                }  
            }  
        }  
    ]  
}
```

Limit who can modify the instance metadata options

The following policy permits only users with the role ec2-imds-admins to make changes to the instance metadata options. If any principal other than the ec2-imds-admins role tries to call the ModifyInstanceMetadataOptions API, it will get an UnauthorizedOperation error. This statement could be used to control the use of the ModifyInstanceMetadataOptions API; there are currently no fine-grained access controls (conditions) for the ModifyInstanceMetadataOptions API.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowOnlyImdsAdminsToModifySettings",  
            "Effect": "Deny",  
            "Action": "ec2:ModifyInstanceMetadataOptions",  
            "Resource": "*",  
            "Condition": {  
                "StringNotLike": {  
                    "aws:PrincipalARN": "arn:aws:iam::*:role/ec2-imds-admins"  
                }  
            }  
        }  
    ]  
}
```

```
        }
    }
}
]
```

Require role credentials to be retrieved from IMDSv2

The following policy specifies that if this policy is applied to a role, and the role is assumed by the EC2 service and the resulting credentials are used to sign a request, then the request must be signed by EC2 role credentials retrieved from IMDSv2. Otherwise, all of its API calls will get an UnauthorizedOperation error. This statement/policy can be applied generally because, if the request is not signed by EC2 role credentials, it has no effect.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RequireAllEc2RolesToUseV2",
            "Effect": "Deny",
            "Action": "*",
            "Resource": "*",
            "Condition": {
                "NumericLessThan": {
                    "ec2:RoleDelivery": "2.0"
                }
            }
        }
    ]
}
```

Work with Amazon EBS volumes and snapshots

For example policies for working with Amazon EBS volumes and snapshots, see [Identity-based policy examples for Amazon EBS](#).

Example policies for working in the Amazon EC2 console

You must grant users the permissions they require for Amazon EC2 using IAM policies. You can use IAM policies to grant users permissions to view and work with specific resources in the Amazon EC2 console. You can use the example policies in the previous section; however, they are designed for requests that are made with the AWS CLI or an AWS SDK. For more information, see [Example](#)

[policies for working with the AWS CLI or an AWS SDK](#) and [Creating IAM policies in the IAM User Guide](#).

The console uses additional API actions for its features, so these policies may not work as expected. For example, a user that has permission to use only the `DescribeVolumes` API action will encounter errors when trying to view volumes in the console. This section demonstrates policies that enable users to work with specific parts of the console. For additional information about creating policies for the Amazon EC2 console, see the following AWS Security Blog post: [Granting Users Permission to Work in the Amazon EC2 Console](#).

Tip

To help you work out which API actions are required to perform tasks in the console, you can use a service such as AWS CloudTrail. For more information, see the [AWS CloudTrail User Guide](#). If your policy does not grant permission to create or modify a specific resource, the console displays an encoded message with diagnostic information. You can decode the message using the [DecodeAuthorizationMessage](#) API action for AWS STS, or the [decode-authorization-message](#) command in the AWS CLI.

Examples

- [Example: Read-only access](#)
- [Example: Use the EC2 launch instance wizard](#)
- [Example: Work with security groups](#)
- [Example: Work with Elastic IP addresses](#)
- [Example: Work with Reserved Instances](#)

Example: Read-only access

To allow users to view all resources in the Amazon EC2 console, you can use the same policy as the following example: [Example: Read-only access](#). Users cannot perform any actions on those resources or create new resources, unless another statement grants them permission to do so.

View instances, AMIs, and snapshots

Alternatively, you can provide read-only access to a subset of resources. To do this, replace the * wildcard in the `ec2:Describe` API action with specific `ec2:Describe` actions for each resource.

The following policy allows users to view all instances, AMIs, and snapshots in the Amazon EC2 console. The `ec2:DescribeTags` action allows users to view public AMIs. The console requires the tagging information to display public AMIs; however, you can remove this action to allow users to view only private AMIs.

```
{  
    "Version": "2012-10-17",  
    "Statement": [{  
        "Effect": "Allow",  
        "Action": [  
            "ec2:DescribeInstances",  
            "ec2:DescribeImages",  
            "ec2:DescribeTags",  
            "ec2:DescribeSnapshots"  
        ],  
        "Resource": "*"  
    }  
}  
}
```

Note

The Amazon EC2 `ec2:Describe*` API actions do not support resource-level permissions, so you cannot control which individual resources users can view in the console. Therefore, the `*` wildcard is necessary in the `Resource` element of the above statement. For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

View instances and CloudWatch metrics

The following policy allows users to view instances in the Amazon EC2 console, as well as CloudWatch alarms and metrics in the **Monitoring** tab of the **Instances** page. The Amazon EC2 console uses the CloudWatch API to display the alarms and metrics, so you must grant users permission to use the `cloudwatch:DescribeAlarms`, `cloudwatch:DescribeAlarmsForMetric`, `cloudwatch>ListMetrics`, `cloudwatch:GetMetricStatistics`, and `cloudwatch:GetMetricData` actions.

```
{  
    "Version": "2012-10-17",
```

```
"Statement": [{}  
    "Effect": "Allow",  
    "Action": [  
        "ec2:DescribeInstances",  
        "ec2:DescribeInstanceTypes",  
        "cloudwatch:DescribeAlarms",  
        "cloudwatch:DescribeAlarmsForMetric",  
        "cloudwatch>ListMetrics",  
        "cloudwatch:GetMetricStatistics",  
        "cloudwatch:GetMetricData"  
    ],  
    "Resource": "*"  
}  
]  
]
```

Example: Use the EC2 launch instance wizard

The Amazon EC2 launch instance wizard is a screen with options to configure and launch an instance. Your policy must include permission to use the API actions that allow users to work with the wizard's options. If your policy does not include permission to use those actions, some items in the wizard cannot load properly, and users cannot complete a launch.

Basic launch instance wizard access

To complete a launch successfully, users must be given permission to use the `ec2:RunInstances` API action, and at least the following API actions:

- `ec2:DescribeImages`: To view and select an AMI.
- `ec2:DescribeInstanceTypes`: To view and select an instance type.
- `ec2:DescribeVpcs`: To view the available network options.
- `ec2:DescribeSubnets`: To view all available subnets for the chosen VPC.
- `ec2:DescribeSecurityGroups` or `ec2>CreateSecurityGroup`: To view and select an existing security group, or to create a new one.
- `ec2:DescribeKeyPairs` or `ec2>CreateKeyPair`: To select an existing key pair, or to create a new one.
- `ec2:AuthorizeSecurityGroupIngress`: To add inbound rules.

{

```
"Version": "2012-10-17",
"Statement": [
    {
        "Effect": "Allow",
        "Action": [
            "ec2:DescribeInstances",
            "ec2:DescribeImages",
            "ec2:DescribeInstanceTypes",
            "ec2:DescribeKeyPairs",
            "ec2:DescribeVpcs",
            "ec2:DescribeSubnets",
            "ec2:DescribeSecurityGroups",
            "ec2:CreateSecurityGroup",
            "ec2:AuthorizeSecurityGroupIngress",
            "ec2:CreateKeyPair"
        ],
        "Resource": "*"
    },
    {
        "Effect": "Allow",
        "Action": "ec2:RunInstances",
        "Resource": "*"
    }
]
```

You can add API actions to your policy to provide more options for users, for example:

- `ec2:DescribeAvailabilityZones`: To view and select a specific Availability Zone.
- `ec2:DescribeNetworkInterfaces`: To view and select existing network interfaces for the selected subnet.
- To add outbound rules to VPC security groups, users must be granted permission to use the `ec2:AuthorizeSecurityGroupEgress` API action. To modify or delete existing rules, users must be granted permission to use the relevant `ec2:RevokeSecurityGroup*` API action.
- `ec2:CreateTags`: To tag the resources that are created by `RunInstances`. For more information, see [Grant permission to tag resources during creation](#). If users do not have permission to use this action and they attempt to apply tags on the tagging page of the launch instance wizard, the launch fails.

Important

Specifying a **Name** while launching an instance creates a tag and requires the `ec2:CreateTags` action. Be careful about granting users permission to use the `ec2:CreateTags` action, because doing so limits your ability to use the `aws:ResourceTag` condition key to restrict their use of other resources. If you grant users permission to use the `ec2:CreateTags` action, they can change a resource's tag in order to bypass those restrictions. For more information, see [Control access to EC2 resources using resource tags](#).

- To use Systems Manager parameters when selecting an AMI, you must add `ssm:DescribeParameters` and `ssm:GetParameters` to your policy. `ssm:DescribeParameters` grants your users the permission to view and select Systems Manager parameters. `ssm:GetParameters` grants your users the permission to get the values of the Systems Manager parameters. You can also restrict access to specific Systems Manager parameters. For more information, see **Restrict access to specific Systems Manager parameters** later in this section.

Currently, the Amazon EC2 `Describe*` API actions do not support resource-level permissions, so you cannot restrict which individual resources users can view in the launch instance wizard. However, you can apply resource-level permissions on the `ec2:RunInstances` API action to restrict which resources users can use to launch an instance. The launch fails if users select options that they are not authorized to use.

Restrict access to a specific instance type, subnet, and Region

The following policy allows users to launch `t2.micro` instances using AMIs owned by Amazon, and only into a specific subnet (`subnet-1a2b3c4d`). Users can only launch in the `sa-east-1` Region. If users select a different Region, or select a different instance type, AMI, or subnet in the launch instance wizard, the launch fails.

The first statement grants users permission to view the options in the launch instance wizard or to create new ones, as explained in the example above. The second statement grants users permission to use the network interface, volume, key pair, security group, and subnet resources for the `ec2:RunInstances` action, which are required to launch an instance into a VPC. For more information about using the `ec2:RunInstances` action, see [Launch instances \(RunInstances\)](#). The third and fourth statements grant users permission to use the instance and AMI resources

respectively, but only if the instance is a `t2.micro` instance, and only if the AMI is owned by Amazon, or certain trusted and verified partners.

```
{  
    "Version": "2012-10-17",  
    "Statement": [{  
        "Effect": "Allow",  
        "Action": [  
            "ec2:DescribeInstances",  
            "ec2:DescribeImages",  
            "ec2:DescribeInstanceTypes",  
            "ec2:DescribeKeyPairs",  
            "ec2:CreateKeyPair",  
            "ec2:DescribeVpcs",  
            "ec2:DescribeSubnets",  
            "ec2:DescribeSecurityGroups",  
            "ec2:CreateSecurityGroup",  
            "ec2:AuthorizeSecurityGroupIngress"  
        ],  
        "Resource": "*"  
    },  
    {  
        "Effect": "Allow",  
        "Action": "ec2:RunInstances",  
        "Resource": [  
            "arn:aws:ec2:sa-east-1:111122223333:network-interface/*",  
            "arn:aws:ec2:sa-east-1:111122223333:volume/*",  
            "arn:aws:ec2:sa-east-1:111122223333:key-pair/*",  
            "arn:aws:ec2:sa-east-1:111122223333:security-group/*",  
            "arn:aws:ec2:sa-east-1:111122223333:subnet/subnet-1a2b3c4d"  
        ]  
    },  
    {  
        "Effect": "Allow",  
        "Action": "ec2:RunInstances",  
        "Resource": [  
            "arn:aws:ec2:sa-east-1:111122223333:instance/*"  
        ],  
        "Condition": {  
            "StringEquals": {  
                "ec2:InstanceType": "t2.micro"  
            }  
        }  
    }  
}
```

```
},
{
  "Effect": "Allow",
  "Action": "ec2:RunInstances",
  "Resource": [
    "arn:aws:ec2:sa-east-1::image/ami-*"
  ],
  "Condition": {
    "StringEquals": {
      "ec2:Owner": "amazon"
    }
  }
}
]
}
```

Restrict access to specific Systems Manager parameters

The following policy grants access to use Systems Manager parameters with a specific name.

The first statement grants users the permission to view Systems Manager parameters when selecting an AMI in the launch instance wizard. The second statement grants users the permission to only use parameters that are named prod-*.

```
{
  "Version": "2012-10-17",
  "Statement": [{
    "Effect": "Allow",
    "Action": [
      "ssm:DescribeParameters"
    ],
    "Resource": "*"
  },
  {
    "Effect": "Allow",
    "Action": [
      "ssm:GetParameters"
    ],
    "Resource": "arn:aws:ssm:us-east-2:123456123:parameter/prod-*"
  }
]
```

Example: Work with security groups

View security groups and add and remove rules

The following policy grants users permission to view security groups in the Amazon EC2 console, to add and remove inbound and outbound rules, and to list and modify rule descriptions for existing security groups that have the tag Department=Test.

In the first statement, the `ec2:DescribeTags` action allows users to view tags in the console, which makes it easier for users to identify the security groups that they are allowed to modify.

```
{  
    "Version": "2012-10-17",  
    "Statement": [{  
        "Effect": "Allow",  
        "Action": [  
            "ec2:DescribeSecurityGroups",  
            "ec2:DescribeSecurityGroupRules",  
            "ec2:DescribeTags"  
        ],  
        "Resource": "*"  
    },  
    {  
        "Effect": "Allow",  
        "Action": [  
            "ec2:AuthorizeSecurityGroupIngress",  
            "ec2:RevokeSecurityGroupIngress",  
            "ec2:AuthorizeSecurityGroupEgress",  
            "ec2:RevokeSecurityGroupEgress",  
            "ec2:ModifySecurityGroupRules",  
            "ec2:UpdateSecurityGroupRuleDescriptionsIngress",  
            "ec2:UpdateSecurityGroupRuleDescriptionsEgress"  
        ],  
        "Resource": [  
            "arn:aws:ec2:region:111122223333:security-group/*"  
        ],  
        "Condition": {  
            "StringEquals": {  
                "aws:ResourceTag/Department": "Test"  
            }  
        }  
    },  
    {
```

```
"Effect": "Allow",
"Action": [
    "ec2:ModifySecurityGroupRules"
],
"Resource": [
    "arn:aws:ec2:region:111122223333:security-group-rule/*"
]
}
]}
```

Work with the Create Security Group dialog box

You can create a policy that allows users to work with the **Create Security Group** dialog box in the Amazon EC2 console. To use this dialog box, users must be granted permission to use at least the following API actions:

- `ec2:CreateSecurityGroup`: To create a new security group.
- `ec2:DescribeVpcs`: To view a list of existing VPCs in the **VPC** list.

With these permissions, users can create a new security group successfully, but they cannot add any rules to it. To work with rules in the **Create Security Group** dialog box, you can add the following API actions to your policy:

- `ec2:AuthorizeSecurityGroupIngress`: To add inbound rules.
- `ec2:AuthorizeSecurityGroupEgress`: To add outbound rules to VPC security groups.
- `ec2:RevokeSecurityGroupIngress`: To modify or delete existing inbound rules. This is useful to allow users to use the **Copy to new** feature in the console. This feature opens the **Create Security Group** dialog box and populates it with the same rules as the security group that was selected.
- `ec2:RevokeSecurityGroupEgress`: To modify or delete outbound rules for VPC security groups. This is useful to allow users to modify or delete the default outbound rule that allows all outbound traffic.
- `ec2:DeleteSecurityGroup`: To cater for when invalid rules cannot be saved. The console first creates the security group, and then adds the specified rules. If the rules are invalid, the action fails, and the console attempts to delete the security group. The user remains in the **Create Security Group** dialog box so that they can correct the invalid rule and try to create the security group again. This API action is not required, but if a user is not granted permission to use it and

attempts to create a security group with invalid rules, the security group is created without any rules, and the user must add them afterward.

- `ec2:UpdateSecurityGroupRuleDescriptionsIngress`: To add or update descriptions of ingress (inbound) security group rules.
- `ec2:UpdateSecurityGroupRuleDescriptionsEgress`: To add or update descriptions of egress (outbound) security group rules.
- `ec2:ModifySecurityGroupRules`: To modify security group rules.
- `ec2:DescribeSecurityGroupRules`: To list security group rules.

The following policy grants users permission to use the **Create Security Group** dialog box, and to create inbound and outbound rules for security groups that are associated with a specific VPC (`vpc-1a2b3c4d`). Users can create security groups for a VPC, but they cannot add any rules to them. Similarly, users cannot add any rules to any existing security group that's not associated with VPC `vpc-1a2b3c4d`. Users are also granted permission to view all security groups in the console. This makes it easier for users to identify the security groups to which they can add inbound rules. This policy also grants users permission to delete security groups that are associated with VPC `vpc-1a2b3c4d`.

```
{  
    "Version": "2012-10-17",  
    "Statement": [{  
        "Effect": "Allow",  
        "Action": [  
            "ec2:DescribeSecurityGroups",  
            "ec2:CreateSecurityGroup",  
            "ec2:DescribeVpcs"  
        ],  
        "Resource": "*"  
    },  
    {  
        "Effect": "Allow",  
        "Action": [  
            "ec2>DeleteSecurityGroup",  
            "ec2:AuthorizeSecurityGroupIngress",  
            "ec2:AuthorizeSecurityGroupEgress"  
        ],  
        "Resource": "arn:aws:ec2:region:111122223333:security-group/*",  
        "Condition":{  
            "ArnEquals": {  
                "ARN": "arn:aws:iam::111122223333:root"  
            }  
        }  
    }  
}
```

```
        "ec2:Vpc": "arn:aws:ec2:region:111122223333:vpc/vpc-1a2b3c4d"
    }
}
]
}
```

Example: Work with Elastic IP addresses

To allow users to view Elastic IP addresses in the Amazon EC2 console, you must grant users permission to use the `ec2:DescribeAddresses` action.

To allow users to work with Elastic IP addresses, you can add the following actions to your policy.

- `ec2:AllocateAddress`: To allocate an Elastic IP address.
- `ec2:ReleaseAddress`: To release an Elastic IP address.
- `ec2:AssociateAddress`: To associate an Elastic IP address with an instance or a network interface.
- `ec2:DescribeNetworkInterfaces` and `ec2:DescribeInstances`: To work with the **Associate address** screen. The screen displays the available instances or network interfaces to which you can associate an Elastic IP address.
- `ec2:DisassociateAddress`: To disassociate an Elastic IP address from an instance or a network interface.

The following policy allows users to view, allocate, and associate Elastic IP addresses with instances. Users cannot associate Elastic IP addresses with network interfaces, disassociate Elastic IP addresses, or release them.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeAddresses",
                "ec2:AllocateAddress",
                "ec2:DescribeInstances",
                "ec2:AssociateAddress"
            ],
        }
    ]
}
```

```
        "Resource": "*"
    }
]
}
```

Example: Work with Reserved Instances

The following policy allows users to view and modify Reserved Instances in your account, as well as purchase new Reserved Instances in the AWS Management Console.

This policy allows users to view all the Reserved Instances, as well as On-Demand Instances, in the account. It's not possible to set resource-level permissions for individual Reserved Instances.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeReservedInstances",
                "ec2:ModifyReservedInstances",
                "ec2:PurchaseReservedInstancesOffering",
                "ec2:DescribeInstances",
                "ec2:DescribeInstanceTypes",
                "ec2:DescribeAvailabilityZones",
                "ec2:DescribeReservedInstancesOfferings"
            ],
            "Resource": "*"
        }
    ]
}
```

The `ec2:DescribeAvailabilityZones` action is necessary to ensure that the Amazon EC2 console can display information about the Availability Zones in which you can purchase Reserved Instances. The `ec2:DescribeInstances` action is not required, but ensures that the user can view the instances in the account and purchase reservations to match the correct specifications.

You can adjust the API actions to limit user access, for example removing `ec2:DescribeInstances` and `ec2:DescribeAvailabilityZones` means the user has read-only access.

AWS managed policies for Amazon Elastic Compute Cloud

To add permissions to users, groups, and roles, it is easier to use AWS managed policies than to write policies yourself. It takes time and expertise to [create IAM customer managed policies](#) that provide your team with only the permissions they need. To get started quickly, you can use our AWS managed policies. These policies cover common use cases and are available in your AWS account. For more information about AWS managed policies, see [AWS managed policies](#) in the *IAM User Guide*.

AWS services maintain and update AWS managed policies. You can't change the permissions in AWS managed policies. Services occasionally add additional permissions to an AWS managed policy to support new features. This type of update affects all identities (users, groups, and roles) where the policy is attached. Services are most likely to update an AWS managed policy when a new feature is launched or when new operations become available. Services do not remove permissions from an AWS managed policy, so policy updates won't break your existing permissions.

Additionally, AWS supports managed policies for job functions that span multiple services. For example, the **ReadOnlyAccess** AWS managed policy provides read-only access to all AWS services and resources. When a service launches a new feature, AWS adds read-only permissions for new operations and resources. For a list and descriptions of job function policies, see [AWS managed policies for job functions](#) in the *IAM User Guide*.

AWS managed policy: AmazonEC2FullAccess

You can attach the AmazonEC2FullAccess policy to your IAM identities. This policy grants permissions that allow full access to Amazon EC2.

To view the permissions for this policy, see [AmazonEC2FullAccess](#) in the *AWS Managed Policy Reference*.

AWS managed policy: AmazonEC2ReadOnlyAccess

You can attach the AmazonEC2ReadOnlyAccess policy to your IAM identities. This policy grants permissions that allow read-only access to Amazon EC2.

To view the permissions for this policy, see [AmazonEC2ReadOnlyAccess](#) in the *AWS Managed Policy Reference*.

AWS managed policy: AWSEC2CapacityReservationFleetRolePolicy

This policy is attached to the service-linked role named **AWSServiceRoleForEC2CapacityReservationFleet** to allow Capacity Reservations to create, modify, and cancel Capacity Reservations on your behalf. For more information, see [Service-linked role for Capacity Reservation Fleet](#).

AWS managed policy: AWSEC2FleetServiceRolePolicy

This policy is attached to the service-linked role named **AWSServiceRoleForEC2Fleet** to allow EC2 Fleet to request, launch, terminate, and tag instances on your behalf. For more information, see [Service-linked role for EC2 Fleet](#).

AWS managed policy: AWSEC2SpotFleetServiceRolePolicy

This policy is attached to the service-linked role named **AWSServiceRoleForEC2SpotFleet** to allow Spot Fleet to launch and manage instances on your behalf. For more information, see [Service-linked role for Spot Fleet](#).

AWS managed policy: AWSEC2SpotServiceRolePolicy

This policy is attached to the service-linked role named **AWSServiceRoleForEC2Spot** to allow Amazon EC2 to launch and manage Spot Instances on your behalf. For more information, see [Service-linked role for Spot Instance requests](#).

AWS managed policy: AWSEC2VssSnapshotPolicy

You can attach this managed policy to the IAM instance profile role that you use for your Amazon EC2 Windows instances. The policy grants permissions to allow Amazon EC2 to create and manage VSS snapshots on your behalf. For more information, see [Managed policy to create VSS snapshots](#).

AWS managed policy: EC2FastLaunchServiceRolePolicy

This policy is attached to the service-linked role named **AWSServiceRoleForEC2FastLaunch** to allow Amazon EC2 to create and manage a set of pre-provisioned snapshots that reduce the time it takes to launch instances from your Windows faster launching-enabled AMI. For more information, see [the section called "Service-linked role"](#).

Amazon EC2 updates to AWS managed policies

View details about updates to AWS managed policies for Amazon EC2 since this service began tracking these changes.

Change	Description	Date
<u>AWSEC2VssSnapshotPolicy</u> – New policy	Amazon EC2 added the AWSEC2VssSnapshotPolicy policy that grants permissions to allow Amazon EC2 to create and manage VSS snapshots on your behalf.	March 28, 2024
<u>EC2FastLaunchServiceRolePolicy</u> – New policy	Amazon EC2 added the Windows faster launching feature to enable Windows AMIs to launch instances faster by creating a set of pre-provisioned snapshots.	November 26, 2021
Amazon EC2 started tracking changes	Amazon EC2 started tracking changes to its AWS managed policies	March 1, 2021

IAM roles for Amazon EC2

Applications must sign their API requests with AWS credentials. Therefore, if you are an application developer, you need a strategy for managing credentials for your applications that run on EC2 instances. For example, you can securely distribute your AWS credentials to the instances, enabling the applications on those instances to use your credentials to sign requests, while protecting your credentials from other users. However, it's challenging to securely distribute credentials to each instance, especially those that AWS creates on your behalf, such as Spot Instances or instances in Auto Scaling groups. You must also be able to update the credentials on each instance when you rotate your AWS credentials.

Note

For your Amazon EC2 workloads, we recommend that you retrieve session credentials using the method described below. These credentials should enable your workload to make AWS API requests, without needing to use `sts:AssumeRole` to assume the same role that is already associated with the instance. Unless you need to pass session tags for attribute-based access control (ABAC) or pass a session policy to further restrict permissions of the role, such role assumption calls are unnecessary as they create a new set of the same temporary role session credentials.

If your workload uses a role to assume itself, you must create a trust policy that explicitly allows that role to assume itself. If you do not create the trust policy, you get the `AccessDenied` error. For more information, see [Modifying a role trust policy](#) in the *IAM User Guide*.

We designed IAM roles so that your applications can securely make API requests from your instances, without requiring you to manage the security credentials that the applications use. Instead of creating and distributing your AWS credentials, you can delegate permission to make API requests using IAM roles as follows:

1. Create an IAM role.
2. Define which accounts or AWS services can assume the role.
3. Define which API actions and resources the application can use after assuming the role.
4. Specify the role when you launch your instance, or attach the role to an existing instance.
5. Have the application retrieve a set of temporary credentials and use them.

For example, you can use IAM roles to grant permissions to applications running on your instances that need to use a bucket in Amazon S3. You can specify permissions for IAM roles by creating a policy in JSON format. These are similar to the policies that you create for users. If you change a role, the change is propagated to all instances.

Note

Amazon EC2 IAM role credentials are not subject to maximum session durations configured in the role. For more information, see [Using IAM roles](#) in the *IAM User Guide*.

You can only attach one IAM role to an instance, but you can attach the same role to many instances. For more information about creating and using IAM roles, see [Roles](#) in the *IAM User Guide*.

You can apply resource-level permissions to your IAM policies to control the users' ability to attach, replace, or detach IAM roles for an instance. For more information, see [Supported resource-level permissions for Amazon EC2 API actions](#) and the following example: [Example: Work with IAM roles](#).

Contents

- [Instance profiles](#)
- [Retrieve security credentials from instance metadata](#)
- [Grant a user permission to pass an IAM role to an instance](#)
- [Work with IAM roles](#)

Instance profiles

Amazon EC2 uses an *instance profile* as a container for an IAM role. When you create an IAM role using the IAM console, the console creates an instance profile automatically and gives it the same name as the role to which it corresponds. If you use the Amazon EC2 console to launch an instance with an IAM role or to attach an IAM role to an instance, you choose the role based on a list of instance profile names.

If you use the AWS CLI, API, or an AWS SDK to create a role, you create the role and instance profile as separate actions, with potentially different names. If you then use the AWS CLI, API, or an AWS SDK to launch an instance with an IAM role or to attach an IAM role to an instance, specify the instance profile name.

An instance profile can contain only one IAM role. This limit cannot be increased.

For more information, see [Instance Profiles](#) in the *IAM User Guide*.

Retrieve security credentials from instance metadata

An application on the instance retrieves the security credentials provided by the role from the instance metadata item `iam/security-credentials/role-name`. The application is granted the permissions for the actions and resources that you've defined for the role through the security credentials associated with the role. These security credentials are temporary and we rotate them automatically. We make new credentials available at least five minutes before the expiration of the old credentials.

Warning

If you use services that use instance metadata with IAM roles, ensure that you don't expose your credentials when the services make HTTP calls on your behalf. The types of services that could expose your credentials include HTTP proxies, HTML/CSS validator services, and XML processors that support XML inclusion.

The following command retrieves the security credentials for an IAM role named s3access.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/iam/security-credentials/s3access
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/iam/security-credentials/s3access
```

The following is example output.

```
{  
    "Code" : "Success",  
    "LastUpdated" : "2012-04-26T16:39:16Z",  
    "Type" : "AWS-HMAC",  
    "AccessKeyId" : "ASIAIOSFODNN7EXAMPLE",  
    "SecretAccessKey" : "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",  
    "Token" : "token",  
    "Expiration" : "2017-05-17T15:09:54Z"  
}
```

For applications, AWS CLI, and Tools for Windows PowerShell commands that run on the instance, you do not have to explicitly get the temporary security credentials—the AWS SDKs, AWS CLI, and Tools for Windows PowerShell automatically get the credentials from the EC2 instance metadata

service and use them. To make a call outside of the instance using temporary security credentials (for example, to test IAM policies), you must provide the access key, secret key, and the session token. For more information, see [Using Temporary Security Credentials to Request Access to AWS Resources](#) in the *IAM User Guide*.

For more information about instance metadata, see [Instance metadata and user data](#). For information about the instance metadata IP address, see [Retrieve instance metadata](#).

Grant a user permission to pass an IAM role to an instance

To enable a user to launch an instance with an IAM role or to attach or replace an IAM role for an existing instance, you must grant the user permission to use the following API actions:

- `iam:PassRole`
- `ec2:AssociateIamInstanceProfile`
- `ec2:ReplaceIamInstanceProfileAssociation`

For example, the following IAM policy grants users permission to launch instances with an IAM role, or to attach or replace an IAM role for an existing instance using the AWS CLI.

Note

If you want the policy to grant users access to all of your roles, specify the resource as `*` in the policy. However, please consider the principle of [least privilege](#) as a best-practice .

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances",  
                "ec2:AssociateIamInstanceProfile",  
                "ec2:ReplaceIamInstanceProfileAssociation"  
            ],  
            "Resource": "*"  
        },  
        {  
            "  
        }  
    ]  
}
```

```
        "Effect": "Allow",
        "Action": "iam:PassRole",
        "Resource": "arn:aws:iam::123456789012:role/DevTeam*"
    }
]
}
```

To grant users permission to launch instances with an IAM role, or to attach or replace an IAM role for an existing instance using the Amazon EC2 console, you must grant them permission to use `iam>ListInstanceProfiles`, `iam:PassRole`, `ec2:AssociateIamInstanceProfile`, and `ec2:ReplaceIamInstanceProfileAssociation` in addition to any other permissions they might need. For example policies, see [Example policies for working in the Amazon EC2 console](#).

Work with IAM roles

You can create an IAM role and attach it to an instance during or after launch. You can also replace or detach an IAM role for an instance.

Contents

- [Create an IAM role](#)
- [Launch an instance with an IAM role](#)
- [Attach an IAM role to an instance](#)
- [Replace an IAM role](#)
- [Detach an IAM role](#)
- [Generate a policy for your IAM role based on access activity](#)

Create an IAM role

You must create an IAM role before you can launch an instance with that role or attach it to an instance.

Console

To create an IAM role using the IAM console

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles** then choose **Create role**.

3. On the **Select trusted entity** page, choose **AWS service**, and then select the **EC2** use case. Choose **Next**.
4. On the **Add permissions** page, select the policies that grants your instances access to the resources that they need. Choose **Next**.
5. On the **Name, review, and create** page, enter a name and description for the role. Optionally, add tags to the role. Choose **Create role**.

Command line

The following example creates an IAM role with a policy that allows the role to use an Amazon S3 bucket.

To create an IAM role and instance profile (AWS CLI)

1. Create the following trust policy and save it in a text file named `ec2-role-trust-policy.json`.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Principal": { "Service": "ec2.amazonaws.com"},  
            "Action": "sts:AssumeRole"  
        }  
    ]  
}
```

2. Create the `s3access` role and specify the trust policy that you created using the [create-role](#) command.

```
aws iam create-role \  
    --role-name s3access \  
    --assume-role-policy-document file://ec2-role-trust-policy.json
```

Example response

```
{  
    "Role": {  
        "AssumeRolePolicyDocument": {
```

```
        "Version": "2012-10-17",
        "Statement": [
            {
                "Action": "sts:AssumeRole",
                "Effect": "Allow",
                "Principal": {
                    "Service": "ec2.amazonaws.com"
                }
            }
        ],
        "RoleId": "AROAIIZKPBKS2LEXAMPLE",
        "CreateDate": "2013-12-12T23:46:37.247Z",
        "RoleName": "s3access",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:role/s3access"
    }
}
```

3. Create an access policy and save it in a text file named `ec2-role-access-policy.json`. For example, this policy grants administrative permissions for Amazon S3 to applications running on the instance.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["s3:*"],
            "Resource": ["*"]
        }
    ]
}
```

4. Attach the access policy to the role using the [put-role-policy](#) command.

```
aws iam put-role-policy \
    --role-name s3access \
    --policy-name S3-Permissions \
    --policy-document file://ec2-role-access-policy.json
```

5. Create an instance profile named `s3access-profile` using the [create-instance-profile](#) command.

```
aws iam create-instance-profile --instance-profile-name s3access-profile
```

Example response

```
{  
    "InstanceProfile": {  
        "InstanceProfileId": "AIPAJTLBPJLEGREXAMPLE",  
        "Roles": [],  
        "CreateDate": "2013-12-12T23:53:34.093Z",  
        "InstanceProfileName": "s3access-profile",  
        "Path": "/",  
        "Arn": "arn:aws:iam::123456789012:instance-profile/s3access-profile"  
    }  
}
```

6. Add the s3access role to the s3access-profile instance profile.

```
aws iam add-role-to-instance-profile \  
    --instance-profile-name s3access-profile \  
    --role-name s3access
```

Alternatively, you can use the following AWS Tools for Windows PowerShell commands:

- [New-IAMRole](#)
- [Register-IAMRolePolicy](#)
- [New-IAMInstanceProfile](#)

Launch an instance with an IAM role

After you've created an IAM role, you can launch an instance, and associate that role with the instance during launch.

Important

After you create an IAM role, it might take several seconds for the permissions to propagate. If your first attempt to launch an instance with a role fails, wait a few seconds

before trying again. For more information, see [Troubleshooting IAM roles in the IAM User Guide](#).

New console

To launch an instance with an IAM role (console)

1. Follow the procedure to [launch an instance](#).
2. Expand **Advanced details**, and for **IAM instance profile**, select the IAM role that you created.

Note

The **IAM instance profile** list displays the name of the instance profile that you created when you created your IAM role. If you created your IAM role using the console, the instance profile was created for you and given the same name as the role. If you created your IAM role using the AWS CLI, API, or an AWS SDK, you may have named your instance profile differently.

3. Configure any other details that you require for your instance or accept the defaults, and select a key pair. For information about the fields in the launch instance wizard, see [Launch an instance using defined parameters](#).
4. In the **Summary** panel, review your instance configuration, and then choose **Launch instance**.
5. If you are using the Amazon EC2 API actions in your application, retrieve the AWS security credentials made available on the instance and use them to sign the requests. The AWS SDK does this for you.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token}  
-Method GET -Uri http://169.254.169.254/latest/meta-data/iam/security-  
credentials/role_name
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/iam/  
security-credentials/role_name
```

Old console

To launch an instance with an IAM role (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the dashboard, choose **Launch instance**.
3. Select an AMI and instance type and then choose **Next: Configure Instance Details**.
4. On the **Configure Instance Details** page, for **IAM role**, select the IAM role that you created.

 **Note**

The **IAM role** list displays the name of the instance profile that you created when you created your IAM role. If you created your IAM role using the console, the instance profile was created for you and given the same name as the role. If you created your IAM role using the AWS CLI, API, or an AWS SDK, you may have named your instance profile differently.

5. Configure any other details, then follow the instructions through the rest of the wizard, or choose **Review and Launch** to accept default settings and go directly to the **Review Instance Launch** page.
6. Review your settings, then choose **Launch** to choose a key pair and launch your instance.
7. If you are using the Amazon EC2 API actions in your application, retrieve the AWS security credentials made available on the instance and use them to sign the requests. The AWS SDK does this for you.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/iam/security-credentials/role_name
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/iam/security-credentials/role_name
```

Command line

You can use the AWS CLI to associate a role with an instance during launch. You must specify the instance profile in the command.

To launch an instance with an IAM role (AWS CLI)

1. Use the [run-instances](#) command to launch an instance using the instance profile. The following example shows how to launch an instance with the instance profile.

```
aws ec2 run-instances \
--image-id ami-11aa22bb \
--iam-instance-profile Name="s3access-profile" \
--key-name my-key-pair \
--security-groups my-security-group \
--subnet-id subnet-1a2b3c4d
```

Alternatively, use the [New-EC2Instance](#) Tools for Windows PowerShell command.

2. If you are using the Amazon EC2 API actions in your application, retrieve the AWS security credentials made available on the instance and use them to sign the requests. The AWS SDK does this for you.

```
curl http://169.254.169.254/latest/meta-data/iam/security-credentials/role_name
```

Attach an IAM role to an instance

To attach an IAM role to an instance that has no role, the instance can be in the stopped or running state.

Console

To attach an IAM role to an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Security, Modify IAM role**.
4. Select the IAM role to attach to your instance, and choose **Save**.

Command line

To attach an IAM role to an instance (AWS CLI)

1. If required, describe your instances to get the ID of the instance to which to attach the role.

```
aws ec2 describe-instances
```

2. Use the [associate-iam-instance-profile](#) command to attach the IAM role to the instance by specifying the instance profile. You can use the Amazon Resource Name (ARN) of the instance profile, or you can use its name.

```
aws ec2 associate-iam-instance-profile \
--instance-id i-1234567890abcdef0 \
--iam-instance-profile Name="TestRole-1"
```

Example response

```
{  
    "IamInstanceProfileAssociation": {  
        "InstanceId": "i-1234567890abcdef0",  
        "State": "associating",  
    }  
}
```

```
        "AssociationId": "iip-assoc-0dbd8529a48294120",
        "IamInstanceProfile": {
            "Id": "AIPAJLNLDX3AMYZNWYYAY",
            "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-1"
        }
    }
```

Alternatively, use the following Tools for Windows PowerShell commands:

- [Get-EC2Instance](#)
- [Register-EC2IamInstanceProfile](#)

Replace an IAM role

To replace the IAM role on an instance that already has an attached IAM role, the instance must be in the running state. You can do this if you want to change the IAM role for an instance without detaching the existing one first. For example, you can do this to ensure that API actions performed by applications running on the instance are not interrupted.

Console

To replace an IAM role for an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Security, Modify IAM role**.
4. Select the IAM role to attach to your instance, and choose **Save**.

Command line

To replace an IAM role for an instance (AWS CLI)

1. If required, describe your IAM instance profile associations to get the association ID for the IAM instance profile to replace.

```
aws ec2 describe-iam-instance-profile-associations
```

2. Use the [replace-iam-instance-profile-association](#) command to replace the IAM instance profile by specifying the association ID for the existing instance profile and the ARN or name of the instance profile that should replace it.

```
aws ec2 replace-iam-instance-profile-association \
    --association-id iip-assoc-0044d817db6c0a4ba \
    --iam-instance-profile Name="TestRole-2"
```

Example response

```
{
    "IamInstanceProfileAssociation": {
        "InstanceId": "i-087711ddaf98f9489",
        "State": "associating",
        "AssociationId": "iip-assoc-09654be48e33b91e0",
        "IamInstanceProfile": {
            "Id": "AIPAJCJEDKX7QYHWYK7GS",
            "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"
        }
    }
}
```

Alternatively, use the following Tools for Windows PowerShell commands:

- [Get-EC2IamInstanceProfileAssociation](#)
- [Set-EC2IamInstanceProfileAssociation](#)

Detach an IAM role

You can detach an IAM role from a running or stopped instance.

Console

To detach an IAM role from an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Security, Modify IAM role**.
4. For **IAM role**, choose **No IAM Role**. Choose **Save**.

5. In the confirmation dialog box, enter **Detach**, and then choose **Detach**.

Command line

To detach an IAM role from an instance (AWS CLI)

1. If required, use [describe-iam-instance-profile-associations](#) to describe your IAM instance profile associations and get the association ID for the IAM instance profile to detach.

```
aws ec2 describe-iam-instance-profile-associations
```

Example response

```
{  
    "IamInstanceProfileAssociations": [  
        {  
            "InstanceId": "i-088ce778fbfeb4361",  
            "State": "associated",  
            "AssociationId": "iip-assoc-0044d817db6c0a4ba",  
            "IamInstanceProfile": {  
                "Id": "AIPAJEDNCAA64SSD265D6",  
                "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"  
            }  
        }  
    ]  
}
```

2. Use the [disassociate-iam-instance-profile](#) command to detach the IAM instance profile using its association ID.

```
aws ec2 disassociate-iam-instance-profile --association-id iip-assoc-0044d817db6c0a4ba
```

Example response

```
{  
    "IamInstanceProfileAssociation": {  
        "InstanceId": "i-087711ddaf98f9489",  
        "State": "disassociating",  
        "AssociationId": "iip-assoc-0044d817db6c0a4ba",  
        "IamInstanceProfile": {  
    
```

```
        "Id": "AIPAJEDNCAA64SSD265D6",
        "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"
    }
}
```

Alternatively, use the following Tools for Windows PowerShell commands:

- [Get-EC2IamInstanceProfileAssociation](#)
- [Unregister-EC2IamInstanceProfile](#)

Generate a policy for your IAM role based on access activity

When you first create an IAM role for your applications, you might sometimes grant permissions beyond what is required. Before launching your application in your production environment, you can generate an IAM policy that is based on the access activity for an IAM role. IAM Access Analyzer reviews your AWS CloudTrail logs and generates a policy template that contains the permissions that have been used by the role in your specified date range. You can use the template to create a managed policy with fine-grained permissions and then attach it to the IAM role. That way, you grant only the permissions that the role needs to interact with AWS resources for your specific use case. This helps you adhere to the best practice of [granting least privilege](#). To learn more, see [Generate policies based on access activity](#) in the *IAM User Guide*.

Authorize inbound traffic for your Windows instances

Security groups enable you to control traffic to your instance, including the kind of traffic that can reach your instance. For example, you can allow computers from only your home network to access your instance using RDP. If your instance is a web server, you can allow all IP addresses to access your instance using HTTP or HTTPS, so that external users can browse the content on your web server.

Your default security groups and newly created security groups include default rules that do not enable you to access your instance from the internet. For more information, see [Default security groups](#) and [Custom security groups](#). To enable network access to your instance, you must allow inbound traffic to your instance. To open a port for inbound traffic, add a rule to a security group that you associated with your instance when you launched it.

To connect to your instance, you must set up a rule to authorize RDP traffic from your computer's public IPv4 address. To allow RDP traffic from additional IP address ranges, add another rule for each range you need to authorize.

If you've enabled your VPC for IPv6 and launched your instance with an IPv6 address, you can connect to your instance using its IPv6 address instead of a public IPv4 address. Your local computer must have an IPv6 address and must be configured to use IPv6.

If you need to enable network access to a Linux instance, see [Authorizing inbound traffic for your Linux instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

Before you start

Decide who requires access to your instance; for example, a single host or a specific network that you trust such as your local computer's public IPv4 address. The security group editor in the Amazon EC2 console can automatically detect the public IPv4 address of your local computer for you. Alternatively, you can use the search phrase "what is my IP address" in an internet browser, or use the following service: [Check IP](#). If you are connecting through an ISP or from behind your firewall without a static IP address, you need to find out the range of IP addresses used by client computers.

Warning

If you use `0.0.0.0/0`, you enable all IPv4 addresses to access your instance using RDP. If you use `::/0`, you enable all IPv6 addresses to access your instance. You should authorize only a specific IP address or range of addresses to access your instance.

Windows Firewall may also block incoming traffic. If you're having trouble setting up access to your instance, you may have to disable Windows Firewall. For more information, see [Remote Desktop can't connect to the remote computer](#).

Add a rule for inbound RDP traffic to a Windows instance

Security groups act as a firewall for associated instances, controlling both inbound and outbound traffic at the instance level. You must add rules to a security group to enable you to connect to your Windows instance from your IP address using RDP.

To add a rule to a security group for inbound RDP traffic over IPv4 (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the top navigation bar, select a Region for the security group. Security groups are specific to a Region, so you should select the same Region in which you created your instance.
3. In the navigation pane, choose **Instances**.
4. Select your instance and, in bottom half of the screen, choose the **Security** tab. **Security groups** lists the security groups that are associated with the instance. **Inbound rules** displays a list of the inbound rules that are in effect for the instance.
5. For the security group to which you'll add the new rule, choose the security group ID link to open the security group.
6. On the **Inbound rules** tab, choose **Edit inbound rules**.
7. On the **Edit inbound rules** page, do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **RDP**.
 - c. For **Source**, choose **My IP** to automatically populate the field with the public IPv4 address of your local computer.

Alternatively, for **Source**, choose **Custom** and enter the public IPv4 address of your computer or network in CIDR notation. For example, if your IPv4 address is 203.0.113.25, enter 203.0.113.25/32 to list this single IPv4 address in CIDR notation. If your company allocates addresses from a range, enter the entire range, such as 203.0.113.0/24.

For information about finding your IP address, see [Before you start](#).
 - d. Choose **Save rules**.

If you launched an instance with an IPv6 address and want to connect to your instance using its IPv6 address, you must add rules that allow inbound IPv6 traffic over RDP.

To add a rule to a security group for inbound RDP traffic over IPv6 (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the top navigation bar, select a Region for the security group. Security groups are specific to a Region, so you should select the same Region in which you created your instance.

3. In the navigation pane, choose **Instances**.
4. Select your instance and, in bottom half of the screen, choose the **Security** tab. **Security groups** lists the security groups that are associated with the instance. **Inbound rules** displays a list of the inbound rules that are in effect for the instance.
5. For the security group to which you'll add the new rule, choose the security group ID link to open the security group.
6. On the **Inbound rules** tab, choose **Edit inbound rules**.
7. On the **Edit inbound rules** page, do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **RDP**.
 - c. For **Source**, choose **Custom** and enter the IPv6 address of your computer in CIDR notation. For example, if your IPv6 address is 2001:db8:1234:1a00:9691:9503:25ad:1761, enter 2001:db8:1234:1a00:9691:9503:25ad:1761/128 to list the single IP address in CIDR notation. If your company allocates addresses from a range, enter the entire range, such as 2001:db8:1234:1a00::/64.
 - d. Choose **Save rules**.

 **Note**

Be sure to run the following commands on your local system, not on the instance itself. For more information about these command line interfaces, see [Access Amazon EC2](#).

To add a rule to a security group using the command line

1. Find the security group that is associated with your instance using one of the following commands:

- [describe-instance-attribute](#) (AWS CLI)

```
aws ec2 describe-instance-attribute --region region --instance-id instance_id --attribute groupSet
```

- [Get-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
PS C:\> (Get-EC2InstanceAttribute -Region region -InstanceId instance_id -  
Attribute groupSet).Groups
```

Both commands return a security group ID, which you use in the next step.

2. Add the rule to the security group using one of the following commands:

- [authorize-security-group-ingress](#) (AWS CLI)

```
aws ec2 authorize-security-group-ingress --region region --group-  
id security_group_id --protocol tcp --port 3389 --cidr cidr_ip_range
```

- [Grant-EC2SecurityGroupIngress](#) (AWS Tools for Windows PowerShell)

The Grant-EC2SecurityGroupIngress command needs an IpPermission parameter, which describes the protocol, port range, and IP address range to be used for the security group rule. The following command creates the IpPermission parameter:

```
PS C:\> $ip1 = @{ IpProtocol="tcp"; FromPort="3389"; ToPort="3389";  
IpRanges="cidr_ip_range" }
```

```
PS C:\> Grant-EC2SecurityGroupIngress -Region region -GroupId security_group_id -  
IpPermission @($ip1)
```

Assign a security group to an instance

You can assign a security group to an instance when you launch the instance. When you add or remove rules, those changes are automatically applied to all instances to which you've assigned the security group.

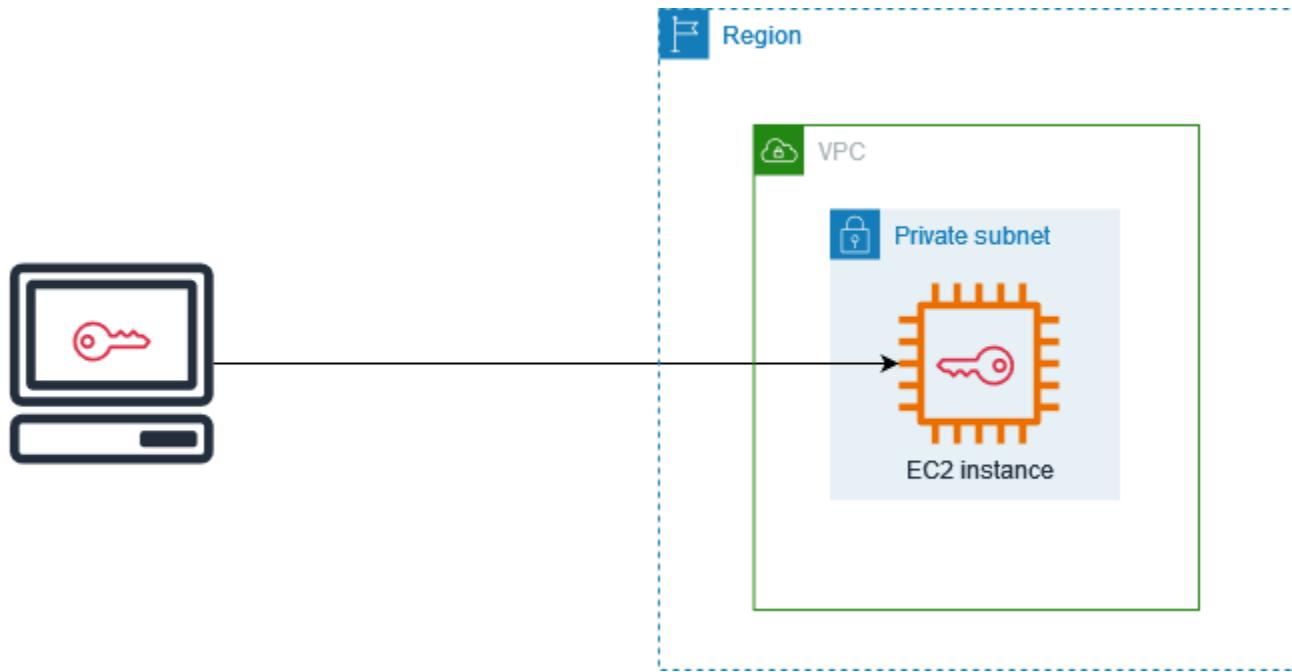

After you launch an instance, you can change its security groups. For more information, see [the section called "Change an instance's security group"](#).

Amazon EC2 key pairs and Amazon EC2 instances

A key pair, consisting of a public key and a private key, is a set of security credentials that you use to prove your identity when connecting to an Amazon EC2 instance. For Linux instances, the

private key allows you to securely SSH into your instance. For Windows instances, the private key is required to decrypt the administrator password, which you then use to connect to your instance.

Amazon EC2 stores the public key on your instance, and you store the private key, as shown in the following diagram. It's important that you store your private key in a secure place because anyone who possesses your private key can connect to your instances that use the key pair.

When you launch an instance, you can [specify a key pair](#). If you plan to connect to the instance using RDP, you must specify a key pair. Depending on how you manage your security, you can specify the same key pair for all your instances or you can specify different key pairs. For more information about connecting to your Windows instance, see [Connect to your Windows instance](#).

⚠ Important

Because Amazon EC2 doesn't keep a copy of your private key, there is no way to recover a private key if you lose it. However, there can still be a way to connect to instances for which you've lost the private key. For more information, see [I've lost my private key. How can I connect to my Windows instance?](#)

As an alternative to key pairs, you can use [AWS Systems Manager Session Manager](#) to connect to your instance with an interactive one-click browser-based shell or the AWS Command Line Interface (AWS CLI).

Contents

- [Create a key pair for your Amazon EC2 instance](#)
- [Tag a key pair](#)
- [Describe your key pairs](#)
- [Delete your key pair](#)
- [Verify the fingerprint of your key pair](#)

Create a key pair for your Amazon EC2 instance

You can use Amazon EC2 to create your key pairs, or you can use a third-party tool to create your key pairs, and then import them to Amazon EC2.

Amazon EC2 supports ED25519 and 2048-bit SSH-2 RSA keys for Linux instances. Amazon EC2 supports 2048-bit SSH-2 RSA keys for Windows instances. ED25519 keys are not supported for Windows instances.

For steps to connect to your Windows instance using RDP after you have created a key pair, see [Connect to your Windows instance](#).

Contents

- [Create a key pair using Amazon EC2](#)
- [Create a key pair using AWS CloudFormation](#)
- [Create a key pair using a third-party tool and import the public key to Amazon EC2](#)

Create a key pair using Amazon EC2

When you create a key pair using Amazon EC2, the public key is stored in Amazon EC2, and you store the private key.

You can create up to 5,000 key pairs per Region. To request an increase, create a support case. For more information, see [Creating a support case](#) in the *AWS Support User Guide*.

Console

To create a key pair using Amazon EC2

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, under **Network & Security**, choose **Key Pairs**.
3. Choose **Create key pair**.
4. For **Name**, enter a descriptive name for the key pair. Amazon EC2 associates the public key with the name that you specify as the key name. A key name can include up to 255 ASCII characters. It can't include leading or trailing spaces.
5. For **Key pair type**, choose **RSA**. Note that **ED25519** keys are not supported for Windows instances.
6. For **Private key file format**, choose the format in which to save the private key. To save the private key in a format that can be used with OpenSSH, choose **pem**. To save the private key in a format that can be used with PuTTY, choose **ppk**.
7. To add a tag to the public key, choose **Add tag**, and enter the key and value for the tag. Repeat for each tag.
8. Choose **Create key pair**.
9. The private key file is automatically downloaded by your browser. The base file name is the name that you specified as the name of your key pair, and the file name extension is determined by the file format that you chose. Save the private key file in a safe place.

 **Important**

This is the only chance for you to save the private key file.

AWS CLI

To create a key pair using Amazon EC2

- Use the [create-key-pair](#) command as follows to generate the key pair and to save the private key to a .pem file.

For --key-name, specify a name for the public key. The name can be up to 255 ASCII characters.

For --key-type, specify either `rsa` or `ed25519`. If you do not include the --key-type parameter, an `rsa` key is created by default. Note that ED25519 keys are not supported for Windows instances.

For `--key-format`, specify either `pem` or `ppk`. If you do not include the `--key-format` parameter, a `pem` file is created by default.

`--query "KeyMaterial"` prints the private key material to the output.

`--output text > my-key-pair.pem` saves the private key material in a file with the specified extension. The extension can be either `.pem` or `.ppk`. The private key can have a name that's different from the public key name, but for ease of use, use the same name.

```
aws ec2 create-key-pair \
--key-name my-key-pair \
--key-type rsa \
--key-format pem \
--query "KeyMaterial" \
--output text > my-key-pair.pem
```

PowerShell

To create a key pair using Amazon EC2

Use the [New-EC2KeyPair](#) AWS Tools for Windows PowerShell command as follows to generate the key and save it to a `.pem` or `.ppk` file.

For `-KeyName`, specify a name for the public key. The name can be up to 255 ASCII characters.

For `-KeyType`, specify either `rsa` or `ed25519`. If you do not include the `-KeyType` parameter, an `rsa` key is created by default. Note that `ED25519` keys are not supported for Windows instances.

For `-KeyFormat`, specify either `pem` or `ppk`. If you do not include the `-KeyFormat` parameter, a `pem` file is created by default.

`KeyMaterial` prints the private key material to the output.

`Out-File -Encoding ascii -FilePath C:\path\my-key-pair.pem` saves the private key material in a file with the the specified extension. The extension can be `.pem` or `.ppk`. The private key can have a name that's different from the public key name, but for ease of use, use the same name.

```
PS C:\> (New-EC2KeyPair -KeyName "my-key-pair" -KeyType "rsa" -KeyFormat "pem").KeyMaterial | Out-File -Encoding ascii -FilePath C:\path\my-key-pair.pem
```

Create a key pair using AWS CloudFormation

When you create a new key pair using AWS CloudFormation, the private key is saved to AWS Systems Manager Parameter Store. The parameter name has the following format:

```
/ec2/keypair/key_pair_id
```

For more information, see [AWS Systems Manager Parameter Store](#) in the *AWS Systems Manager User Guide*.

To create a key pair using AWS CloudFormation

1. Specify the [AWS::EC2::KeyPair](#) resource in your template.

```
Resources:  
  NewKeyPair:  
    Type: 'AWS::EC2::KeyPair'  
    Properties:  
      KeyName: new-key-pair
```

2. Use the [describe-key-pairs](#) command as follows to get the ID of the key pair.

```
aws ec2 describe-key-pairs --filters Name=key-name,Values=new-key-pair --query  
  KeyPairs[*].KeyId --output text
```

The following is example output.

```
key-05abb699beEXAMPLE
```

3. Use the [get-parameter](#) command as follows to get the parameter for your key and save the key material in a .pem file.

```
aws ssm get-parameter --name /ec2/keypair/key-05abb699beEXAMPLE --with-decryption  
  --query Parameter.Value --output text > new-key-pair.pem
```

Required IAM permissions

To enable AWS CloudFormation to manage Parameter Store parameters on your behalf, the IAM role assumed by AWS CloudFormation or your user must have the following permissions:

- `ssm:PutParameter` – Grants permission to create a parameter for the private key material.
- `ssm:DeleteParameter` – Grants permission to delete the parameter that stored the private key material. This permission is required whether the key pair was imported or created by AWS CloudFormation.

When AWS CloudFormation deletes a key pair that was created or imported by a stack, it performs a permissions check to determine whether you have permission to delete parameters, even though AWS CloudFormation creates a parameter only when it creates a key pair, not when it imports a key pair. AWS CloudFormation tests for the required permission using a fabricated parameter name that does not match any parameter in your account. Therefore, you might see a fabricated parameter name in the `AccessDeniedException` error message.

Create a key pair using a third-party tool and import the public key to Amazon EC2

Instead of using Amazon EC2 to create your key pair, you can create an RSA key pair by using a third-party tool, and then import the public key to Amazon EC2.

Requirements for key pairs

- Supported types: RSA. Amazon EC2 does not accept DSA keys.

 **Note**

ED25519 keys are not supported for Windows instances.

- Supported formats:
 - OpenSSH public key format
 - SSH private key file format must be PEM or PPK
 - (RSA only) Base64 encoded DER format
 - (RSA only) SSH public key file format as specified in [RFC 4716](#)
- Supported lengths: 1024, 2048, and 4096.

To create a key pair using a third-party tool

1. Generate a key pair with a third-party tool of your choice. For example, you can use **ssh-keygen** (a tool provided with the standard OpenSSH installation). Alternatively, Java, Ruby, Python, and many other programming languages provide standard libraries that you can use to create an RSA key pair.

 **Important**

The private key must be in the PEM or PPK format. For example, use `ssh-keygen -m PEM` to generate the OpenSSH key in the PEM format.

2. Save the public key to a local file. For example, `C:\keys\my-key-pair.pub`. The file name extension for this file is not important.
3. Save the private key to a local file that has the `.pem` or `.ppk` extension. For example, `C:\keys\my-key-pair.pem` or `C:\keys\my-key-pair.ppk`. The file name extension for this file is important because only `.pem` files can be selected when connecting to your Windows instance from the EC2 console.

 **Important**

Save the private key file in a safe place. You'll need to provide the name of your public key when you launch an instance, and the corresponding private key each time you connect to the instance.

After you have created the key pair, use one of the following methods to import your public key to Amazon EC2.

Console

To import the public key to Amazon EC2

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Key Pairs**.
3. Choose **Import key pair**.
4. For **Name**, enter a descriptive name for the public key. The name can include up to 255 ASCII characters. It can't include leading or trailing spaces.

Note

When you connect to your instance from the EC2 console, the console suggests this name for the name of your private key file.

5. Either choose **Browse** to navigate to and select your public key, or paste the contents of your public key into the **Public key contents** field.
6. Choose **Import key pair**.
7. Verify that the public key that you imported appears in the list of key pairs.

AWS CLI

To import the public key to Amazon EC2

Use the [import-key-pair](#) AWS CLI command.

To verify that the key pair was imported successfully

Use the [describe-key-pairs](#) AWS CLI command.

PowerShell

To import the public key to Amazon EC2

Use the [Import-EC2KeyPair](#) AWS Tools for Windows PowerShell command.

To verify that the key pair was imported successfully

Use the [Get-EC2KeyPair](#) AWS Tools for Windows PowerShell command.

Tag a key pair

To help categorize and manage the key pairs that you've either created using Amazon EC2 or imported to Amazon EC2, you can tag them with custom metadata. For more information about how tags work, see [Tag your Amazon EC2 resources](#).

Console

To view, add, or delete a tag for a key pair

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Key Pairs**.
3. Select a public key, and then choose **Actions, Manage tags**.
4. The **Manage tags** page displays any tags that are assigned to the public key.
 - To add a tag, choose **Add tag**, and then enter the tag key and value. You can add up to 50 tags per key. For more information, see [Tag restrictions](#).
 - To delete a tag, choose **Remove** next to the tag to delete.
5. Choose **Save**.

AWS CLI

To view the tags for your key pairs

Use the [describe-tags](#) AWS CLI command. In the following example, you describe the tags for all of your public keys.

```
C:\> aws ec2 describe-tags --filters "Name=resource-type,Values=key-pair"
```

```
{  
    "Tags": [  
        {  
            "Key": "Environment",  
            "ResourceId": "key-0123456789EXAMPLE",  
            "ResourceType": "key-pair",  
            "Value": "Production"  
        },  
        {  
            "Key": "Environment",  
            "ResourceId": "key-9876543210EXAMPLE",  
            "ResourceType": "key-pair",  
            "Value": "Production"  
        }  
    ]  
}
```

To describe the tags for a key pair

Use the [describe-key-pairs](#) AWS CLI command.

```
C:\> aws ec2 describe-key-pairs --key-pair-ids key-0123456789EXAMPLE
```

```
{  
    "KeyPairs": [  
        {  
            "KeyName": "MyKeyPair",  
            "KeyFingerprint":  
                "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f",  
            "KeyId": "key-0123456789EXAMPLE",  
            "Tags": [  
                {  
                    "Key": "Environment",  
                    "Value": "Production"  
                }]  
        }]  
    }  
}
```

To tag a key pair

Use the [create-tags](#) AWS CLI command. In the following example, the public key is tagged with Key=Cost-Center and Value=CC-123.

```
C:\> aws ec2 create-tags --resources key-0123456789EXAMPLE --tags Key=Cost-Center,Value=CC-123
```

To delete a tag from a key pair

Use the [delete-tags](#) AWS CLI command. For examples, see [Examples in the AWS CLI Command Reference](#).

PowerShell

To view tags for your key pairs

Use the [Get-EC2Tag](#) command.

To describe the tags for a key pair

Use the [Get-EC2KeyValuePair](#) command.

To tag a key pair

Use the [New-EC2Tag](#) command.

To delete a tag from a key pair

Use the [Remove-EC2Tag](#) command.

Describe your key pairs

You can describe the key pairs that you stored in Amazon EC2. You can also retrieve the public key material and identify the public key that was specified at launch.

Topics

- [Describe your key pairs](#)
- [Retrieve the public key material](#)
- [Identify the public key specified at launch](#)

Describe your key pairs

You can view the following information about your public keys that are stored in Amazon EC2: public key name, ID, key type, fingerprint, public key material, the date and time (in the UTC time zone) the key was created by Amazon EC2 (if the key was created by a third-party tool, then it's the date and time the key was imported to Amazon EC2), and any tags that are associated with the public key.

You can use the Amazon EC2 console or AWS CLI to view information about your public keys.

Console

To view information about your public keys

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigator, choose **Key Pairs**.
3. You can view the information about each public key in the **Key pairs** table.

Key pairs (23) Info					
<input type="text"/> Filter key pairs					
	Name	Type	Created	Fingerprint	ID
<input type="checkbox"/>	ed25519	2021/08/05 10:06 GMT+2	xeDxC7/lVRZ8mFlzsKidfQ2FcfWlg4C3...		key- key- key-
<input type="checkbox"/>	rsa	2020/05/13 17:16 GMT+2	ed:71:62:da:a4:d1:f6:47:61:4b:d1:a7:2:...		key- key- key-

4. To view a public key's tags, select the check box next to the key, and then choose **Actions**, **Manage tags**.

AWS CLI

To describe a public key

Use the `describe-key-pairs` command and specify the `--key-names` parameter.

```
aws ec2 describe-key-pairs --key-names key-pair-name
```

Example output

```
{  
    "KeyPairs": [  
        {  
            "KeyId": "key-0123456789example",  
            "KeyFingerprint":  
                "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f",  
            "KeyName": "key-pair-name",  
            "KeyType": "rsa",  
            "Tags": [],  
            "CreateTime": "2022-04-28T11:37:26.000Z"  
        }  
    ]  
}
```

Alternatively, instead of `--key-names`, you can specify the `--key-pair-ids` parameter to identify the public key.

```
aws ec2 describe-key-pairs --key-pair-ids key-0123456789example
```

To view the public key material in the output, you must specify the `--include-public-key` parameter.

```
aws ec2 describe-key-pairs --key-names key-pair-name --include-public-key
```

Example output – In the output, the PublicKey field contains the public key material.

```
{  
  "KeyPairs": [  
    {  
      "KeyId": "key-0123456789example",
```

```
        "KeyFingerprint":  
        "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f",  
        "KeyName": "key-pair-name",  
        "KeyType": "rsa",  
        "Tags": [],  
        "PublicKey": "ssh-ed25519  
AAAAAC3NzaC1lZDI1NTE5AAAIj7az1DjVHAsSxgcpCRZ3oWnTm0nAFM64y9jd22ioI/ my-key-pair",  
        "CreateTime": "2022-04-28T11:37:26.000Z"  
    }  
}  
}
```

Retrieve the public key material

You can use various methods to get access to the public key material. You can retrieve the public key material from the matching private key on your local computer, or from the instance metadata on the instance that was launched with the public key, or by using the `describe-key-pairs` AWS CLI command.

Use one of the following methods to retrieve the public key material.

From the private key

On your local Windows computer, you can use PuTTYgen to get the public key for your key pair.

Start PuTTYgen and choose **Load**. Select the .ppk or .pem private key file. PuTTYgen displays the public key under **Public key for pasting into OpenSSH authorized_keys file**. You can also view the public key by choosing **Save public key**, specifying a name for the file, saving the file, and then opening the file.

From the instance metadata

You can use Instance Metadata Service Version 2 or Instance Metadata Service Version 1 to retrieve the public key from the instance metadata.

Note

If you change the key pair that you use to connect to the instance, Amazon EC2 does not update the instance metadata to show the new public key. The instance metadata continues to show the public key for the key pair that you specified when you launched the instance.

To retrieve the public key material from the instance metadata

Use one of the following commands from your instance.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/public-keys/0/openssh-key
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/public-keys/0/openssh-key
```

Example output

```
ssh-rsa AAAAB3NzaC1yc2EAAAQABAAQClKsfkNkuSevGj3eYhCe53pcjqP3maAhDFcvBS706V  
hz2ItxCih+PnDSUaw+wNQn/mZphTk/a/gU8jEzo0wbkM4yxyb/wB96xbiFveSFJu0p/d6RJhJOI0iBXr  
lsLnBITntckiJ7FbtxJMXLvvwJryDUilBMTjYtwB+QhYXUM0zce5Pjz5/i8SeJtjnV3iAoG/cQk+0Fzz  
qaeJAAHco+CY/5WrUBkrHmFJr6HcXkvJdWPkYQS3xqC0+FmUZofz221CBt5IMucxXPkX4rWi+z7wB3Rb  
BQoQzd8v7yeb70z1PnW0yN0qFU0XA246RA8QFYiCNYwI3f05p6KLxEXAMPLE key-pair-name
```

For more information about instance metadata, see [Retrieve instance metadata](#).

From describe-key-pairs

To retrieve the public key material from the `describe-key-pairs` AWS CLI command

Use the [describe-key-pairs](#) command and specify the `--key-names` parameter to identify the public key. To include the public key material in the output, specify the `--include-public-key` parameter.

```
aws ec2 describe-key-pairs --key-names key-pair-name --include-public-key
```

Example output – In the output, the `PublicKey` field contains the public key material.

```
{
```

```
"KeyPairs": [  
    {  
        "KeyId": "key-0123456789example",  
        "KeyFingerprint":  
            "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f",  
        "KeyName": "key-pair-name",  
        "KeyType": "rsa",  
        "Tags": [],  
        "PublicKey": "ssh-ed25519  
AAAAC3NzaC1lZDI1NTE5AAAIj7az1DjVHAsSxgcpCRZ3oWnTm0nAFM64y9jd22ioI/ my-key-pair",  
        "CreateTime": "2022-04-28T11:37:26.000Z"  
    }  
]
```

Alternatively, instead of `--key-names`, you can specify the `--key-pair-ids` parameter to identify the public key.

```
aws ec2 describe-key-pairs --key-pair-ids key-0123456789example --include-public-key
```

Identify the public key specified at launch

If you specify a public key when you launch an instance, the public key name is recorded by the instance.

To identify the public key that was specified at launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and then select your instance.
3. On the **Details** tab, under **Instance details**, the **Key pair assigned at launch** field displays the name of the public key that you specified when you launched the instance.

Note

The value of the **Key pair assigned at launch** field does not change even if you change the public key on the instance, or add public keys.

Delete your key pair

You can delete a key pair, which removes the public key that is stored in Amazon EC2. Deleting a key pair does not delete the matching private key.

When you delete a public key using the following methods, you're only deleting the public key that you stored in Amazon EC2 when you [created](#) or [imported](#) the key pair. Deleting a public key doesn't remove the public key from any instances to which you've added it, either when you launched the instance or later. It also doesn't delete the private key on your local computer. You can continue to connect to instances that you launched using a public key that you've deleted from Amazon EC2 as long as you still have the private key (. pem) file.

Important

If you're using an Auto Scaling group (for example, in an Elastic Beanstalk environment), ensure that the public key you're deleting is not specified in an associated launch template or launch configuration. If Amazon EC2 Auto Scaling detects an unhealthy instance, it launches a replacement instance. However, the instance launch fails if the public key cannot be found. For more information, see [Launch templates](#) in the *Amazon EC2 Auto Scaling User Guide*.

Console

To delete your public key on Amazon EC2

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Key Pairs**.
3. Select the key pair to delete and choose **Actions, Delete**.
4. In the confirmation field, enter Delete and then choose **Delete**.

AWS CLI

To delete your public key on Amazon EC2

Use the [delete-key-pair](#) AWS CLI command.

PowerShell

To delete your public key on Amazon EC2

Use the [Remove-EC2KeyPair](#) AWS Tools for Windows PowerShell command.

Verify the fingerprint of your key pair

To verify the fingerprint of your key pair, compare the fingerprint displayed on the **Key pairs** page in the Amazon EC2 console, or returned by the [describe-key-pairs](#) command, with the fingerprint that you generate using the private key on your local computer. These fingerprints should match.

When Amazon EC2 calculates a fingerprint, Amazon EC2 might append padding to the fingerprint with = characters. Other tools, such as **ssh-keygen**, might omit this padding.

How the fingerprints are calculated

Amazon EC2 calculates the fingerprints differently using different hash functions depending on whether the key pair was created by Amazon EC2 or imported to Amazon EC2.

The following table lists the hash functions that are used to calculate the fingerprints for RSA key pairs that are created by Amazon EC2 and imported to Amazon EC2.

Hash functions used to calculate fingerprints

Key pair source	RSA key pairs
Created by Amazon EC2	SHA-1
Imported to Amazon EC2	MD5 ¹

¹ If you import a public RSA key to Amazon EC2, the fingerprint is calculated using an MD5 hash function. This is true regardless of how you created the key pair, for example, by using a third-party tool or by generating a new public key from an existing private key created using Amazon EC2.

When using the same key pair in different Regions

If you plan to use the same key pair to connect to instances in different AWS Regions, you must import the public key to all of the Regions in which you'll use it. If you use Amazon EC2 to create the key pair, you can [Retrieve the public key material](#) so that you can import the public key to the other Regions.

Note

If you create an RSA key pair using Amazon EC2, and then you generate a public key from the Amazon EC2 private key, the imported public keys will have a different fingerprint than the original public key. This is because the fingerprint of the original RSA key created using Amazon EC2 is calculated using a SHA-1 hash function, while the fingerprint of the imported RSA keys is calculated using an MD5 hash function.

Generate a fingerprint from the private key

Use one of the following commands to generate a fingerprint from the private key on your local machine.

If you're using a Windows local machine, you can run the following commands using the Windows Subsystem for Linux (WSL). Install the WSL and a Linux distribution using the instructions in the [Windows 10 Installation Guide](#). The example in the instructions installs the Ubuntu distribution of Linux, but you can install any distribution. You are prompted to restart your computer for the changes to take effect.

- **If you created the key pair using Amazon EC2**

Use the OpenSSL tools to generate a fingerprint as shown in the following examples.

```
openssl pkcs8 -in path_to_private_key -inform PEM -outform DER -topk8 -nocrypt |  
openssl sha1 -c
```

- **If you imported the public key to Amazon EC2**

You can follow this procedure regardless of how you created the key pair, for example, by using a third-party tool or by generating a new public key from an existing private key created using Amazon EC2

Use the OpenSSL tools to generate the fingerprint as shown in the following example.

```
openssl rsa -in path_to_private_key -pubout -outform DER | openssl md5 -c
```

- **If you created an OpenSSH key pair using OpenSSH 7.8 or later and imported the public key to Amazon EC2**

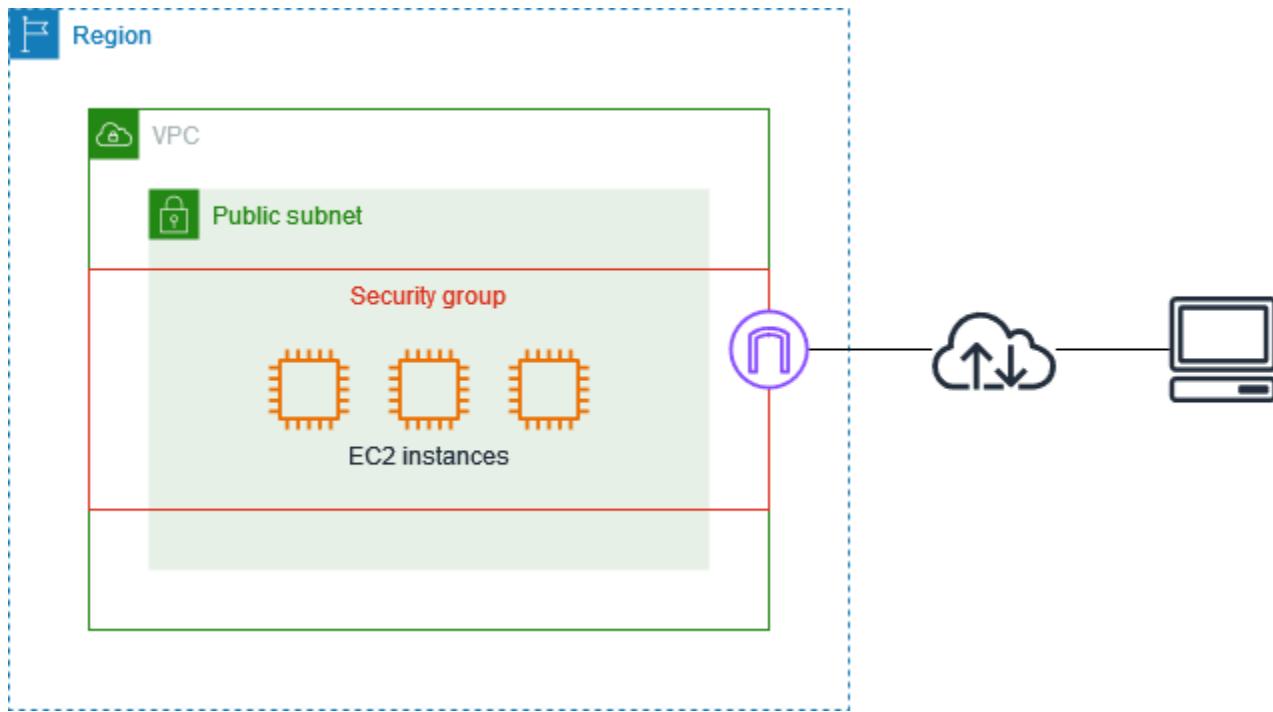

Use **ssh-keygen** to generate the fingerprint as shown in the following examples.

```
ssh-keygen -ef path_to_private_key -m PEM | openssl rsa -RSAPublicKey_in -outform DER  
| openssl md5 -c
```

Amazon EC2 security groups for Windows instances

A *security group* acts as a virtual firewall for your EC2 instances to control incoming and outgoing traffic. Inbound rules control the incoming traffic to your instance, and outbound rules control the outgoing traffic from your instance. When you launch an instance, you can specify one or more security groups. If you don't specify a security group, Amazon EC2 uses the default security group for the VPC. You can add rules to each security group that allow traffic to or from its associated instances. You can modify the rules for a security group at any time. New and modified rules are automatically applied to all instances that are associated with the security group. When Amazon EC2 decides whether to allow traffic to reach an instance, it evaluates all of the rules from all of the security groups that are associated with the instance.

The following diagram shows a VPC with a subnet, an internet gateway, and a security group. The subnet contains EC2 instances. The security group is assigned to the instances. The only traffic that reaches the instance is the traffic allowed by the security group rules. For example, if the security group contains a rule that allows RDP traffic from your network, then you can connect to your instance from your computer using RDP. If the security group contains a rule that allows all traffic from the resources assigned to it, then each instance can receive any traffic sent from the other instances.

After you launch an instance, you can change its security groups. Security groups are associated with network interfaces. Changing an instance's security groups changes the security groups associated with the primary network interface (eth0). For more information, see [Change an instance's security group](#). You can also change the security groups associated with any other network interface. For more information, see [Modify network interface attributes](#).

Security is a shared responsibility between AWS and you. For more information, see [Security in Amazon EC2](#). AWS provides security groups as one of the tools for securing your instances, and you need to configure them to meet your security needs. If you have requirements that aren't fully met by security groups, you can maintain your own firewall on any of your instances in addition to using security groups.

To allow traffic to a Linux instance, see [Amazon EC2 security groups for Linux instances](#) in the [Amazon EC2 User Guide for Linux Instances](#).

There is no additional charge for using security groups.

Security group rules

The rules of a security group control the inbound traffic that's allowed to reach the instances that are associated with the security group. The rules also control the outbound traffic that's allowed to leave them.

The following are the characteristics of security group rules:

- By default, security groups contain outbound rules that allow all outbound traffic. You can delete these rules. Note that Amazon EC2 blocks traffic on port 25 by default. For more information, see [Restriction on email sent using port 25](#).
- Security group rules are always permissive; you can't create rules that deny access.
- Security group rules enable you to filter traffic based on protocols and port numbers.
- Security groups are stateful—if you send a request from your instance, the response traffic for that request is allowed to flow in regardless of inbound security group rules. For VPC security groups, this also means that responses to allowed inbound traffic are allowed to flow out, regardless of outbound rules. For more information, see [Security group connection tracking](#).
- You can add and remove rules at any time. Your changes are automatically applied to the instances that are associated with the security group.

The effect of some rule changes can depend on how the traffic is tracked. For more information, see [Security group connection tracking](#).

- When you associate multiple security groups with an instance, the rules from each security group are effectively aggregated to create one set of rules. Amazon EC2 uses this set of rules to determine whether to allow access.

You can assign multiple security groups to an instance. Therefore, an instance can have hundreds of rules that apply. This might cause problems when you access the instance. We recommend that you condense your rules as much as possible.

 **Note**

Security groups cannot block DNS requests to or from the Route 53 Resolver, sometimes referred to as the 'VPC+2 IP address' (see [What is Amazon Route 53 Resolver?](#) in the

*Amazon Route 53 Developer Guide), or the 'AmazonProvidedDNS' (see [Work with DHCP option sets](#) in the *Amazon Virtual Private Cloud User Guide*). If you wish to filter DNS requests through the Route 53 Resolver, you can enable Route 53 Resolver DNS Firewall (see [Route 53 Resolver DNS Firewall](#) in the *Amazon Route 53 Developer Guide*).*

For each rule, you specify the following:

- **Name:** The name for the security group (for example, "my-security-group").

A name can be up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and `._-:/()#@[]+=;{}!$^*`. When the name contains trailing spaces, we trim the spaces when we save the name. For example, if you enter "Test Security Group " for the name, we store it as "Test Security Group".

- **Protocol:** The protocol to allow. The most common protocols are 6 (TCP), 17 (UDP), and 1 (ICMP).
- **Port range:** For TCP, UDP, or a custom protocol, the range of ports to allow. You can specify a single port number (for example, 22), or range of port numbers (for example, 7000-8000).
- **ICMP type and code:** For ICMP, the ICMP type and code. For example, use type 8 for ICMP Echo Request or type 128 for ICMPv6 Echo Request.
- **Source or destination:** The source (inbound rules) or destination (outbound rules) for the traffic to allow. Specify one of the following:
 - A single IPv4 address. You must use the /32 prefix length. For example, 203.0.113.1/32.
 - A single IPv6 address. You must use the /128 prefix length. For example, 2001:db8:1234:1a00::123/128.
 - A range of IPv4 addresses, in CIDR block notation. For example, 203.0.113.0/24.
 - A range of IPv6 addresses, in CIDR block notation. For example, 2001:db8:1234:1a00::/64.
 - The ID of a prefix list. For example, p1-1234abc1234abc123. For more information, see [Prefix lists](#) in the *Amazon VPC User Guide*.
 - The ID of a security group (referred to here as the specified security group). For example, the current security group, a security group from the same VPC, or a security group for a peered VPC. This allows traffic based on the private IP addresses of the resources associated with the specified security group. This does not add rules from the specified security group to the current security group.

- **(Optional) Description:** You can add a description for the rule, which can help you identify it later. A description can be up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and ._-:/()#@[]+=;{}!\$*.

When you create a security group rule, AWS assigns a unique ID to the rule. You can use the ID of a rule when you use the API or CLI to modify or delete the rule.

When you specify a security group as the source or destination for a rule, the rule affects all instances that are associated with the security group. Incoming traffic is allowed based on the private IP addresses of the instances that are associated with the source security group (and not the public IP or Elastic IP addresses). For more information about IP addresses, see [Amazon EC2 instance IP addressing](#). If your security group rule references a deleted security group in the same VPC or in a peer VPC, or if it references a security group in a peer VPC for which the VPC peering connection has been deleted, the rule is marked as stale. For more information, see [Working with Stale Security Group Rules](#) in the *Amazon VPC Peering Guide*.

If there is more than one rule for a specific port, Amazon EC2 applies the most permissive rule. For example, if you have a rule that allows access to TCP port 3389 (RDP) from IP address 203.0.113.1, and another rule that allows access to TCP port 3389 from everyone, everyone has access to TCP port 3389.

When you add, update, or remove rules, the changes are automatically applied to all instances associated with the security group.

Security group connection tracking

Your security groups use connection tracking to track information about traffic to and from the instance. Rules are applied based on the connection state of the traffic to determine if the traffic is allowed or denied. With this approach, security groups are stateful. This means that responses to inbound traffic are allowed to flow out of the instance regardless of outbound security group rules, and vice versa.

As an example, suppose that you initiate a command such as netcat or similar to your instances from your home computer, and your inbound security group rules allow ICMP traffic. Information about the connection (including the port information) is tracked. Response traffic from the instance for the command is not tracked as a new request, but rather as an established connection, and is allowed to flow out of the instance, even if your outbound security group rules restrict outbound ICMP traffic.

For protocols other than TCP, UDP, or ICMP, only the IP address and protocol number is tracked. If your instance sends traffic to another host, and the host sends the same type of traffic to your instance within 600 seconds, the security group for your instance accepts it regardless of inbound security group rules. The security group accepts it because it's regarded as response traffic for the original traffic.

When you change a security group rule, its tracked connections are not immediately interrupted. The security group continues to allow packets until existing connections time out. To ensure that traffic is immediately interrupted, or that all traffic is subject to firewall rules regardless of the tracking state, you can use a network ACL for your subnet. Network ACLs are stateless and therefore do not automatically allow response traffic. Adding a network ACL that blocks traffic in either direction breaks existing connections. For more information, see [Network ACLs](#) in the *Amazon VPC User Guide*.

Note

Security groups have no effect on DNS traffic to or from the Route 53 Resolver, sometimes referred to as the 'VPC+2 IP address' (see [What is Amazon Route 53 Resolver?](#) in the *Amazon Route 53 Developer Guide*), or the 'AmazonProvidedDNS' (see [Work with DHCP option sets](#) in the *Amazon Virtual Private Cloud User Guide*). If you wish to filter DNS requests through the Route 53 Resolver, you can enable Route 53 Resolver DNS Firewall (see [Route 53 Resolver DNS Firewall](#) in the *Amazon Route 53 Developer Guide*).

Untracked connections

Not all flows of traffic are tracked. If a security group rule permits TCP or UDP flows for all traffic (0.0.0.0/0 or ::/0) and there is a corresponding rule in the other direction that permits all response traffic (0.0.0.0/0 or ::/0) for any port (0-65535), then that flow of traffic is not tracked, unless it is part of an [automatically tracked connection](#). The response traffic for an untracked flow is allowed based on the inbound or outbound rule that permits the response traffic, not based on tracking information.

An untracked flow of traffic is immediately interrupted if the rule that enables the flow is removed or modified. For example, if you have an open (0.0.0.0/0) outbound rule, and you remove a rule that allows all (0.0.0.0/0) inbound SSH (TCP port 22) traffic to the instance (or modify it such that the connection would no longer be permitted), your existing SSH connections to the instance are immediately dropped. The connection was not previously being tracked, so the change will break

the connection. On the other hand, if you have a narrower inbound rule that initially allows an SSH connection (meaning that the connection was tracked), but change that rule to no longer allow new connections from the address of the current SSH client, the existing SSH connection is not interrupted because it is tracked.

Automatically tracked connections

Connections made through the following are automatically tracked, even if the security group configuration does not otherwise require tracking. These connections must be tracked to ensure symmetric routing, as there could be multiple valid reply paths.

- Egress-only internet gateways
- Gateway Load Balancers
- Global Accelerator accelerators
- NAT gateways
- Network Firewall firewall endpoints
- Network Load Balancers
- AWS PrivateLink (interface VPC endpoints)
- Transit gateway attachments
- AWS Lambda (Hyperplane elastic network interfaces)

Throttling

Amazon EC2 defines the maximum number of connections that can be tracked per instance. After the maximum is reached, any packets that are sent or received are dropped because a new connection cannot be established. When this happens, applications that send and receive packets cannot communicate properly. Use the `conntrack_allowance_available` network performance metric to determine the number of tracked connections still available for that instance type.

To determine whether packets were dropped because the network traffic for your instance exceeded the maximum number of connections that can be tracked, use the `conntrack_allowance_exceeded` network performance metric. For more information, see [Monitor network performance for your EC2 instance](#).

With Elastic Load Balancing, if you exceed the maximum number of connections that can be tracked per instance, we recommend that you scale either the number of instances registered with the load balancer or the size of the instances registered with the load balancer.

Idle connection tracking timeout

The security group tracks each connection established to ensure that return packets are delivered as expected. There is a maximum number of connections that can be tracked per instance. Connections that remain idle can lead to connection tracking exhaustion and cause connections not to be tracked and packets to be dropped. You can set the timeout for idle connection tracking on an Elastic network interface.

 **Note**

This feature is only available for [instances built on the AWS Nitro System](#).

There are three configurable timeouts:

- **TCP established timeout:** Timeout (in seconds) for idle TCP connections in an established state. Min: 60 seconds. Max: 432000 seconds (5 days). Default: 432000 seconds. Recommended: Less than 432000 seconds.
- **UDP timeout:** Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction. Min: 30 seconds. Max: 60 seconds. Default: 30 seconds.
- **UDP stream timeout:** Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction. Min: 60 seconds. Max: 180 seconds (3 minutes). Default: 180 seconds.

You may want to modify the default timeouts for any of the following cases:

- If you are [monitoring tracked connections using Amazon EC2 network performance metrics](#), the *conntrack_allowance_exceeded* and *conntrack_allowance_available* metrics enable you to monitor dropped packets and tracked connection utilization to proactively manage EC2 instance capacity with scale up or out actions to help meet network connections demand before dropping packets. If you are observing *conntrack_allowance_exceeded* drops on your EC2 instances, you may benefit from setting a lower TCP established timeout to account for stale TCP/UDP sessions resulting from improper clients or network middle boxes.

- Typically, load balancers or firewalls have TCP Established idle timeout in the range of 60 to 90 minutes. If you are running workloads that are expected to handle a very high number of connections (greater than 100k) from appliances like network firewalls, configuring a similar timeout on an EC2 network interface is advised.
- If you are running workloads with high numbers of connections like DNS, SIP, SNMP, Syslog, Radius and other services that primarily use UDP to serve requests, setting the 'UDP-stream' timeout to 60s provides higher scale/performance for existing capacity and to prevent gray failures.
- For TCP/UDP connections through network load balancers (NLBs) and elastic load balancers (ELB), all connections are tracked. Idle timeout value for TCP flows is 350secs and UDP flows is 120 secs, and varies from interface level timeout values. You may want to configure timeouts at the network interface level to allow for more flexibility for timeout than the defaults for ELB/NLB.

You have the option to configure the connection tracking timeouts when you do the following:

- [Create a network interface](#)
- [Modify network interface attributes](#)
- [Launch an EC2 instance](#)
- [Create an EC2 instance launch template](#)

Example

In the following example, the security group has inbound rules that allow TCP and ICMP traffic, and outbound rules that allow all outbound traffic.

Inbound

Protocol type	Port number	Source
TCP	22 (SSH)	203.0.113.1/32
TCP	80 (HTTP)	0.0.0.0/0
TCP	80 (HTTP)	::/0
ICMP	All	0.0.0.0/0

Outbound

Protocol type	Port number	Destination
All	All	0.0.0.0/0
All	All	::/0

With a direct network connection to the instance or network interface, the tracking behavior is as follows:

- Inbound and outbound TCP traffic on port 22 (SSH) is tracked, because the inbound rule allows traffic from 203.0.113.1/32 only, and not all IP addresses (0.0.0.0/0).
- Inbound and outbound TCP traffic on port 80 (HTTP) is not tracked, because the inbound and outbound rules allow traffic from all IP addresses.
- ICMP traffic is always tracked.

If you remove the outbound rule for IPv4 traffic, all inbound and outbound IPv4 traffic is tracked, including traffic on port 80 (HTTP). The same applies for IPv6 traffic if you remove the outbound rule for IPv6 traffic.

Default and custom security groups

Your AWS account automatically has a default security group for the default VPC in each Region. If you don't specify a security group when you launch an instance, the instance is automatically associated with the default security group for the VPC. If you don't want your instances to use the default security group, you can create your own custom security groups and specify them when you launch your instances.

Contents

- [Default security groups](#)
- [Custom security groups](#)

Default security groups

Each VPC comes with a default security group. We recommend that you create security groups for specific instances or groups of instances instead of using the default security group. However, if

If you don't specify a security group when you launch an instance, we associate the instance with the default security group for the VPC.

The name of a default security group is "default". The following are the default rules for a default security group.

Inbound

Source	Protocol	Port range	Description
<i>sg-1234567890abcde f0</i>	All	All	Allows inbound traffic from all resources that are assigned to this security group. The source is the ID of this security group.

Outbound

Destination	Protocol	Port range	Description
0.0.0.0/0	All	All	Allows all outbound IPv4 traffic.
::/0	All	All	Allows all outbound IPv6 traffic. This rule is added only if your VPC has an associated IPv6 CIDR block.

Default security group basics

- You can change the rules for a default security group.
- You can't delete a default security group. If you try to delete a default security group, we return the following error code: `Client.CannotDelete`.

Custom security groups

You can create multiple security groups to reflect the different roles that your instances play; for example, web servers or database servers.

When you create a security group, you must provide it with a name and a description. Security group names and descriptions can be up to 255 characters in length, and are limited to the following characters:

a-z, A-Z, 0-9, spaces, and . _:/()#@[]+=&{}!\$*

A security group name cannot start with the following: sg-. A security group name must be unique for the VPC.

The following are the default rules for a security group that you create:

- Allows no inbound traffic
- Allows all outbound traffic

After you've created a security group, you can change its inbound rules to reflect the type of inbound traffic that you want to reach the associated instances. You can also change its outbound rules.

For more information about the rules you can add to a security group, see [Security group rules for different use cases](#).

Work with security groups

You can assign a security group to an instance when you launch the instance. When you add or remove rules, those changes are automatically applied to all instances to which you've assigned the security group. For more information, see [Assign a security group to an instance](#).

After you launch an instance, you can change its security groups. For more information, see [Change an instance's security group](#).

You can create, view, update, and delete security groups and security group rules using the Amazon EC2 console and the command line tools.

Tasks

- [Create a security group](#)
- [Copy a security group](#)
- [View your security groups](#)
- [Add rules to a security group](#)

- [Update security group rules](#)
- [Delete rules from a security group](#)
- [Delete a security group](#)
- [Assign a security group to an instance](#)
- [Change an instance's security group](#)

Create a security group

Although you can use the default security group for your instances, you might want to create your own groups to reflect the different roles that instances play in your system.

By default, new security groups start with only an outbound rule that allows all traffic to leave the instances. You must add rules to enable any inbound traffic or to restrict the outbound traffic.

A security group can be used only in the VPC for which it is created.

Console

To create a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Choose **Create security group**.
4. In the **Basic details** section, do the following.
 - a. Enter a descriptive name and brief description for the security group. They can't be edited after the security group is created. The name and description can be up to 255 characters long. The valid characters are a-z, A-Z, 0-9, spaces, and _-:/()#@[]+=&{}!\$*.
 - b. For **VPC**, choose the VPC.
5. You can add security group rules now, or you can add them later. For more information, see [Add rules to a security group](#).
6. You can add tags now, or you can add them later. To add a tag, choose **Add new tag** and enter the tag key and value.
7. Choose **Create security group**.

Command line

To create a security group

Use one of the following commands:

- [create-security-group](#) (AWS CLI)
- [New-EC2SecurityGroup](#) (AWS Tools for Windows PowerShell)

Copy a security group

You can create a new security group by creating a copy of an existing one. When you copy a security group, the copy is created with the same inbound and outbound rules as the original security group. If the original security group is in a VPC, the copy is created in the same VPC unless you specify a different one.

The copy receives a new unique security group ID and you must give it a name. You can also add a description.

You can't copy a security group from one Region to another Region.

You can create a copy of a security group using the Amazon EC2 console.

To copy a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group to copy and choose **Actions, Copy to new security group**.
4. Specify a name and optional description, and change the VPC and security group rules if needed.
5. Choose **Create**.

View your security groups

You can view information about your security groups using one of the following methods.

Console

To view your security groups

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Your security groups are listed. To view the details for a specific security group, including its inbound and outbound rules, choose its ID in the **Security group ID** column.

Command line

To view your security groups

Use one of the following commands.

- [describe-security-groups](#) (AWS CLI)
- [describe-security-group-rules](#) (AWS CLI)
- [Get-EC2SecurityGroup](#) (AWS Tools for Windows PowerShell)

Amazon EC2 Global View

You can use Amazon EC2 Global View to view your security groups across all Regions for which your AWS account is enabled. For more information, see [Amazon EC2 Global View](#).

Add rules to a security group

When you add a rule to a security group, the new rule is automatically applied to any instances that are associated with the security group. There might be a short delay before the rule is applied. For more information, see [Security group rules for different use cases](#) and [Security group rules](#).

Console

To add an inbound rule to a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group, and choose **Actions, Edit inbound rules**.
4. For each rule, choose **Add rule** and do the following.

- a. For **Type**, choose the type of protocol to allow.
 - For **Custom TCP** or **Custom UDP**, you must enter the port range to allow. For example, 0–99.
 - For **Custom ICMP**, you must choose the ICMP type from **Protocol**. The port range is configured for you. For example, to allow **ping** commands, choose **Echo Request** from **Protocol**.
 - For any other type, the protocol and port range are configured for you.
- b. For **Source**, do one of the following to allow traffic.
 - Choose **Custom** and then enter an IP address in CIDR notation, a CIDR block, another security group, or a prefix list.
 - Choose **Anywhere** to allow all traffic for the specified protocol to reach your instance. This option automatically adds the 0.0.0.0/0 IPv4 CIDR block as the source. If your security group is in a VPC that's enabled for IPv6, this option automatically adds a rule for the ::/0 IPv6 CIDR block.

 **Warning**

If you choose **Anywhere**, you enable all IPv4 and IPv6 addresses to access your instance the specified protocol. If you are adding rules for ports 22 (SSH) or 3389 (RDP), you should authorize only a specific IP address or range of addresses to access your instance.

- Choose **My IP** to allow inbound traffic from only your local computer's public IPv4 address.
 - c. For **Description**, optionally specify a brief description for the rule.
5. Choose **Preview changes**, **Save rules**.

To add an outbound rule to a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group, and choose **Actions**, **Edit outbound rules**.
4. For each rule, choose **Add rule** and do the following.

- a. For **Type**, choose the type of protocol to allow.
 - For **Custom TCP** or **Custom UDP**, you must enter the port range to allow. For example, 0–99.
 - For **Custom ICMP**, you must choose the ICMP type from **Protocol**. The port range is configured for you.
 - For any other type, the protocol and port range are configured automatically.
 - b. For **Destination**, do one of the following.
 - Choose **Custom** and then enter an IP address in CIDR notation, a CIDR block, another security group, or a prefix list for which to allow outbound traffic.
 - Choose **Anywhere** to allow outbound traffic to all IP addresses. This option automatically adds the 0.0.0.0/0 IPv4 CIDR block as the destination.
- If your security group is in a VPC that's enabled for IPv6, this option automatically adds a rule for the ::/0 IPv6 CIDR block.
- c. (Optional) For **Description**, specify a brief description for the rule.

5. Choose **Preview changes, Confirm**.

Command line

To add rules to a security group

Use one of the following commands.

- [authorize-security-group-ingress](#) (AWS CLI)
- [Grant-EC2SecurityGroupIngress](#) (AWS Tools for Windows PowerShell)

To add one or more egress rules to a security group

Use one of the following commands.

- [authorize-security-group-egress](#) (AWS CLI)
- [Grant-EC2SecurityGroupEgress](#) (AWS Tools for Windows PowerShell)

Update security group rules

You can update a security group rule using one of the following methods. The updated rule is automatically applied to any instances that are associated with the security group.

Console

When you modify the protocol, port range, or source or destination of an existing security group rule using the console, the console deletes the existing rule and adds a new one for you.

To update a security group rule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group.
4. Choose **Actions, Edit inbound rules** to update a rule for inbound traffic or **Actions, Edit outbound rules** to update a rule for outbound traffic.
5. Update the rule as required.
6. Choose **Preview changes, Confirm**.

To tag a security group rule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group.
4. On the **Inbound rules** or **Outbound rules** tab, select the check box for the rule and then choose **Manage tags**.
5. The **Manage tags** page displays any tags that are assigned to the rule. To add a tag, choose **Add tag** and enter the tag key and value. To delete a tag, choose **Remove** next to the tag that you want to delete.
6. Choose **Save changes**.

Command line

You cannot modify the protocol, port range, or source or destination of an existing rule using the Amazon EC2 API or a command line tools. Instead, you must delete the existing rule and add a new rule. You can, however, update the description of an existing rule.

To update a rule

Use one the following command.

- [modify-security-group-rules](#) (AWS CLI)

To update the description for an existing inbound rule

Use one of the following commands.

- [update-security-group-rule-descriptions-ingress](#) (AWS CLI)
- [Update-EC2SecurityGroupRuleIngressDescription](#) (AWS Tools for Windows PowerShell)

To update the description for an existing outbound rule

Use one of the following commands.

- [update-security-group-rule-descriptions-egress](#) (AWS CLI)
- [Update-EC2SecurityGroupRuleEgressDescription](#) (AWS Tools for Windows PowerShell)

To tag a security group rule

Use one of the following commands.

- [create-tags](#) (AWS CLI)
- [New-EC2Tag](#) (AWS Tools for Windows PowerShell)

Delete rules from a security group

When you delete a rule from a security group, the change is automatically applied to any instances associated with the security group.

You can delete rules from a security group using one of the following methods.

Console

To delete a security group rule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group to update, choose **Actions**, and then choose **Edit inbound rules** to remove an inbound rule or **Edit outbound rules** to remove an outbound rule.
4. Choose the **Delete** button to the right of the rule to delete.
5. Choose **Save rules**. Alternatively, choose **Preview changes**, review your changes, and choose **Confirm**.

Command line

To remove one or more ingress rules from a security group

Use one of the following commands.

- [revoke-security-group-ingress](#) (AWS CLI)
- [Revoke-EC2SecurityGroupIngress](#) (AWS Tools for Windows PowerShell)

To remove one or more egress rules from a security group

Use one of the following commands.

- [revoke-security-group-egress](#) (AWS CLI)
- [Revoke-EC2SecurityGroupEgress](#) (AWS Tools for Windows PowerShell)

Delete a security group

You can't delete a security group that is associated with an instance. You can't delete the default security group. You can't delete a security group that is referenced by a rule in another security group in the same VPC. If your security group is referenced by one of its own rules, you must delete the rule before you can delete the security group.

Console

To delete a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group and choose **Actions, Delete security groups**.
4. When prompted for confirmation, choose **Delete**.

Command line

To delete a security group

Use one of the following commands.

- [delete-security-group](#) (AWS CLI)
- [Remove-EC2SecurityGroup](#) (AWS Tools for Windows PowerShell)

Assign a security group to an instance

You can assign one or more security groups to an instance when you launch the instance. You can also specify one or more security groups in a launch template. The security groups are assigned to all instances that are launched using the launch template.

- To assign a security group to an instance when you launch the instance, see [Network settings of Launch an instance using defined parameters](#) (new console) or [Step 6: Configure Security Group](#) (old console).
- To specify a security group in a launch template, see [Network settings of Create a launch template from parameters](#).

Change an instance's security group

After you launch an instance, you can change its security groups by adding or removing security groups.

Requirements

- The instance must be in the running or stopped state.

- A security group is specific to a VPC. You can assign a security group to one or more instances launched in the VPC for which you created the security group.

Console

To change the security groups for an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and then choose **Actions, Security, Change security groups**.
4. For **Associated security groups**, select a security group from the list and choose **Add security group**.

To remove an already associated security group, choose **Remove** for that security group.

5. Choose **Save**.

Command line

To change the security groups for an instance

Use one of the following commands.

- [modify-instance-attribute](#) (AWS CLI)
- [Edit-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

Security group rules for different use cases

You can create a security group and add rules that reflect the role of the instance that's associated with the security group. For example, an instance that's configured as a web server needs security group rules that allow inbound HTTP and HTTPS access. Likewise, a database instance needs rules that allow access for the type of database, such as access over port 3306 for MySQL.

The following are examples of the kinds of rules that you can add to security groups for specific kinds of access.

Examples

- [Web server rules](#)

- [Database server rules](#)
- [Rules to connect to instances from your computer](#)
- [Rules to connect to instances from an instance with the same security group](#)
- [Rules for ping/ICMP](#)
- [DNS server rules](#)
- [Amazon EFS rules](#)
- [Elastic Load Balancing rules](#)
- [VPC peering rules](#)

Web server rules

The following inbound rules allow HTTP and HTTPS access from any IP address. If your VPC is enabled for IPv6, you can add rules to control inbound HTTP and HTTPS traffic from IPv6 addresses.

Protocol type	Protocol number	Port	Source IP	Notes
TCP	6	80 (HTTP)	0.0.0.0/0	Allows inbound HTTP access from any IPv4 address
TCP	6	443 (HTTPS)	0.0.0.0/0	Allows inbound HTTPS access from any IPv4 address
TCP	6	80 (HTTP)	::/0	Allows inbound HTTP access from any IPv6 address
TCP	6	443 (HTTPS)	::/0	Allows inbound HTTPS access from any IPv6 address

Database server rules

The following inbound rules are examples of rules you might add for database access, depending on what type of database you're running on your instance. For more information about Amazon RDS instances, see the [Amazon RDS User Guide](#).

For the source IP, specify one of the following:

- A specific IP address or range of IP addresses (in CIDR block notation) in your local network
- A security group ID for a group of instances that access the database

Protocol type	Protocol number	Port	Notes
TCP	6	1433 (MS SQL)	The default port to access a Microsoft SQL Server database, for example, on an Amazon RDS instance
TCP	6	3306 (MySQL/Aurora)	The default port to access a MySQL or Aurora database, for example, on an Amazon RDS instance
TCP	6	5439 (Redshift)	The default port to access an Amazon Redshift cluster database.
TCP	6	5432 (PostgreSQL)	The default port to access a PostgreSQL database, for example, on an Amazon RDS instance
TCP	6	1521 (Oracle)	The default port to access an Oracle database, for example, on an Amazon RDS instance

You can optionally restrict outbound traffic from your database servers. For example, you might want to allow access to the internet for software updates, but restrict all other kinds of traffic. You must first remove the default outbound rule that allows all outbound traffic.

Protocol type	Protocol number	Port	Destination IP	Notes
TCP	6	80 (HTTP)	0.0.0.0/0	Allows outbound HTTP access to any IPv4 address
TCP	6	443 (HTTPS)	0.0.0.0/0	Allows outbound HTTPS access to any IPv4 address
TCP	6	80 (HTTP)	::/0	(IPv6-enabled VPC only) Allows outbound HTTP access to any IPv6 address
TCP	6	443 (HTTPS)	::/0	(IPv6-enabled VPC only) Allows outbound HTTPS access to any IPv6 address

Rules to connect to instances from your computer

To connect to your instance, your security group must have inbound rules that allow SSH access (for Linux instances) or RDP access (for Windows instances).

Protocol type	Protocol number	Port	Source IP
TCP	6	22 (SSH)	The public IPv4 address of your computer, or a range of IP addresses in your local network. If your VPC is enabled for IPv6 and your instance has an IPv6 address, you can enter an IPv6 address or range.
TCP	6	3389 (RDP)	The public IPv4 address of your computer, or a range of IP addresses in your local network. If your VPC is enabled for IPv6 and your instance

Protocol type	Protocol number	Port	Source IP
			has an IPv6 address, you can enter an IPv6 address or range.

Rules to connect to instances from an instance with the same security group

To allow instances that are associated with the same security group to communicate with each other, you must explicitly add rules for this.

 **Note**

If you configure routes to forward the traffic between two instances in different subnets through a middlebox appliance, you must ensure that the security groups for both instances allow traffic to flow between the instances. The security group for each instance must reference the private IP address of the other instance, or the CIDR range of the subnet that contains the other instance, as the source. If you reference the security group of the other instance as the source, this does not allow traffic to flow between the instances.

The following table describes the inbound rule for a security group that enables associated instances to communicate with each other. The rule allows all types of traffic.

Protocol type	Protocol number	Ports	Source IP
-1 (All)	-1 (All)	-1 (All)	The ID of the security group, or the CIDR range of the subnet that contains the other instance (see note).

Rules for ping/ICMP

The **ping** command is a type of ICMP traffic. To ping your instance, you must add one of the following inbound ICMP rules.

Type	Protocol	Source		
Custom ICMP - IPv4	Echo request	The public IPv4 address of your computer, a specific IPv4 address, or an IPv4 or IPv6 address from anywhere.		
All ICMP - IPv4	IPv4 ICMP (1)	The public IPv4 address of your computer, a specific IPv4 address, or an IPv4 or IPv6 address from anywhere.		

To use the **ping6** command to ping the IPv6 address for your instance, you must add the following inbound ICMPv6 rule.

Type	Protocol	Source		
All ICMP - IPv6	IPv6 ICMP (58)	The IPv6 address of your computer, a specific IPv4 address, or an IPv4 or IPv6 address from anywhere.		

DNS server rules

If you've set up your EC2 instance as a DNS server, you must ensure that TCP and UDP traffic can reach your DNS server over port 53.

For the source IP, specify one of the following:

- An IP address or range of IP addresses (in CIDR block notation) in a network
- The ID of a security group for the set of instances in your network that require access to the DNS server

Protocol type	Protocol number	Port
TCP	6	53
UDP	17	53

Amazon EFS rules

If you're using an Amazon EFS file system with your Amazon EC2 instances, the security group that you associate with your Amazon EFS mount targets must allow traffic over the NFS protocol.

Protocol type	Protocol number	Ports	Source IP	Notes
TCP	6	2049 (NFS)	The ID of the security group	Allows inbound NFS access from resources (including the mount target) associated with this security group

To mount an Amazon EFS file system on your Amazon EC2 instance, you must connect to your instance. Therefore, the security group associated with your instance must have rules that allow inbound SSH from your local computer or local network.

Protocol type	Protocol number	Ports	Source IP	Notes
TCP	6	22 (SSH)	The IP address range of your local computer, or the range of IP addresses (in CIDR block notation) for your network.	Allows inbound SSH access from your local computer.

Elastic Load Balancing rules

If you're using a load balancer, the security group associated with your load balancer must have rules that allow communication with your instances or targets. For more information, see [Configure security groups for your Classic Load Balancer](#) in the *User Guide for Classic Load Balancers*, and [Security groups for your Application Load Balancer](#) in the *User Guide for Application Load Balancers*.

VPC peering rules

You can update the inbound or outbound rules for your VPC security groups to reference security groups in the peered VPC. Doing so allows traffic to flow to and from instances that are associated with the referenced security group in the peered VPC. For more information about how to configure security groups for VPC peering, see [Updating your security groups to reference peer VPC groups](#).

Access Amazon EC2 using an interface VPC endpoint

You can improve the security posture of your VPC by creating a private connection between your VPC and Amazon EC2. You can access Amazon EC2 as if it were in your VPC, without the use of an internet gateway, NAT device, VPN connection, or AWS Direct Connect connection. Instances in your VPC don't need public IP addresses to access Amazon EC2.

For more information, see [Access AWS services through AWS PrivateLink](#) in the *AWS PrivateLink Guide*.

Contents

- [Create an interface VPC endpoint](#)

- [Create an endpoint policy](#)

Create an interface VPC endpoint

Create an interface endpoint for Amazon EC2 using the following service name:

- **com.amazonaws.*region*.ec2** — Creates an endpoint for the Amazon EC2 API actions.

For more information, see [Access an AWS service using an interface VPC endpoint](#) in the *AWS PrivateLink Guide*.

Create an endpoint policy

An endpoint policy is an IAM resource that you can attach to your interface endpoint. The default endpoint policy allows full access to the Amazon EC2 API through the interface endpoint. To control the access allowed to the Amazon EC2 API from your VPC, attach a custom endpoint policy to the interface endpoint.

An endpoint policy specifies the following information:

- The principals that can perform actions.
- The actions that can be performed.
- The resource on which the actions can be performed.

Important

When a non-default policy is applied to an interface VPC endpoint for Amazon EC2, certain failed API requests, such as those failing from RequestLimitExceeded, might not be logged to AWS CloudTrail or Amazon CloudWatch.

For more information, see [Control access to services using endpoint policies](#) in the *AWS PrivateLink Guide*.

The following example shows a VPC endpoint policy that denies permission to create unencrypted volumes or to launch instances with unencrypted volumes. The example policy also grants permission to perform all other Amazon EC2 actions.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Action": "ec2:*",  
            "Effect": "Allow",  
            "Resource": "*",  
            "Principal": "*"  
        },  
        {  
            "Action": [  
                "ec2:CreateVolume"  
            ],  
            "Effect": "Deny",  
            "Resource": "*",  
            "Principal": "*",  
            "Condition": {  
                "Bool": {  
                    "ec2:Encrypted": "false"  
                }  
            }  
        },  
        {  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Effect": "Deny",  
            "Resource": "*",  
            "Principal": "*",  
            "Condition": {  
                "Bool": {  
                    "ec2:Encrypted": "false"  
                }  
            }  
        }  
    ]  
}
```

Configuration management in Amazon EC2

Amazon Machine Images (AMIs) provide an initial configuration for an Amazon EC2 instance, which includes the Windows OS and optional customer-specific customizations, such as applications and security controls. Create an AMI catalog containing customized security configuration baselines to

ensure all Windows instances are launched with standard security controls. Security baselines can be baked into an AMI, bootstrapped dynamically when an EC2 instance is launched, or packaged as a product for uniform distribution through AWS Service Catalog portfolios. For more information on securing an AMI, see [Best Practices for Building an AMI](#).

Each Amazon EC2 instance should adhere to organizational security standards. Do not install any Windows roles and features that are not required, and do install software to protect against malicious code (antivirus, antimalware, exploit mitigation), monitor host-integrity, and perform intrusion detection. Configure security software to monitor and maintain OS security settings, protect the integrity of critical OS files, and alert on deviations from the security baseline. Consider implementing recommended security configuration benchmarks published by Microsoft, the Center for Internet Security (CIS), or the National Institute of Standards and Technology (NIST). Consider using other Microsoft tools for particular application servers, such as the [Best Practice Analyzer for SQL Server](#).

AWS customers can also run Amazon Inspector assessments to improve the security and compliance of applications deployed on Amazon EC2 instances. Amazon Inspector automatically assesses applications for vulnerabilities or deviations from best practices and includes a knowledge base of hundreds of rules mapped to common security compliance standards (for example, PCI DSS) and vulnerability definitions. Examples of built-in rules include checking if remote root login is enabled, or if vulnerable software versions are installed. These rules are regularly updated by AWS security researchers.

Update management in Amazon EC2

We recommend that you regularly patch, update, and secure the operating system and applications on your EC2 instances. You can use [AWS Systems Manager Patch Manager](#) to automate the process of installing security-related updates for both the operating system and applications.

For EC2 instances in an Auto Scaling group, you can use the [AWS-PatchAsgInstance](#) runbook to help avoid instances that are undergoing patching from being replaced. Alternatively, you can use any automatic update services or recommended processes for installing updates that are provided by the application vendor.

You should configure Windows Update on your Amazon EC2 instances running Windows Server. By default, you will not receive Windows updates on AMIs provided by AWS. For more information, see [Best practices for Windows on Amazon EC2](#).

For a list of the latest Amazon EC2 AMIs running Windows Server, see [Details About AWS Windows AMI Versions](#).

Change management in Amazon EC2

After initial security baselines are applied to Amazon EC2 instances at launch, control ongoing Amazon EC2 changes to maintain the security of your virtual machines. Establish a change management process to authorize and incorporate changes to AWS resources (such as security groups, route tables, and network ACLs) as well as to OS and application configurations (such as Windows or application patching, software upgrades, or configuration file updates).

AWS provides several tools to help manage changes to AWS resources, including AWS CloudTrail, AWS Config, AWS CloudFormation, and AWS Elastic Beanstalk, AWS OpsWorks, and management packs for Systems Center Operations Manager and System Center Virtual Machine Manager. Note that Microsoft releases Windows patches every Tuesday (sometimes even daily) and AWS updates all Windows AMIs managed by AWS within five days after Microsoft releases a patch. Therefore it is important to continually patch all baseline AMIs, update AWS CloudFormation templates and Auto Scaling group configurations with the latest AMI IDs, and implement tools to automate running instance patch management.

Microsoft provides several options for managing Windows OS and application changes. SCCM, for example, provides full lifecycle coverage of environment modifications. Select tools that address business requirements and control how changes will affect application SLAs, capacity, security, and disaster recovery procedures. Avoid manual changes and instead leverage automated configuration management software or command line tools such as the EC2 Run Command or Windows PowerShell to implement scripted, repeatable change processes. To assist with this requirement, use bastion hosts with enhanced logging for all interactions with your Windows instances to ensure that all events and tasks are automatically recorded.

Compliance validation for Amazon EC2

To learn whether an AWS service is within the scope of specific compliance programs, see [AWS services in Scope by Compliance Program](#) and choose the compliance program that you are interested in. For general information, see [AWS Compliance Programs](#).

You can download third-party audit reports using AWS Artifact. For more information, see [Downloading Reports in AWS Artifact](#).

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- [Security and Compliance Quick Start Guides](#) – These deployment guides discuss architectural considerations and provide steps for deploying baseline environments on AWS that are security and compliance focused.
- [Architecting for HIPAA Security and Compliance on Amazon Web Services](#) – This whitepaper describes how companies can use AWS to create HIPAA-eligible applications.

 **Note**

Not all AWS services are HIPAA eligible. For more information, see the [HIPAA Eligible Services Reference](#).

- [AWS Compliance Resources](#) – This collection of workbooks and guides might apply to your industry and location.
- [AWS Customer Compliance Guides](#) – Understand the shared responsibility model through the lens of compliance. The guides summarize the best practices for securing AWS services and map the guidance to security controls across multiple frameworks (including National Institute of Standards and Technology (NIST), Payment Card Industry Security Standards Council (PCI), and International Organization for Standardization (ISO)).
- [Evaluating Resources with Rules](#) in the *AWS Config Developer Guide* – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- [AWS Security Hub](#) – This AWS service provides a comprehensive view of your security state within AWS. Security Hub uses security controls to evaluate your AWS resources and to check your compliance against security industry standards and best practices. For a list of supported services and controls, see [Security Hub controls reference](#).
- [AWS Audit Manager](#) – This AWS service helps you continuously audit your AWS usage to simplify how you manage risk and compliance with regulations and industry standards.

Amazon EC2 provides Amazon Machine Images (AMI) for Windows Server to help you meet the compliance standards of the Security Technical Implementation Guide (STIG). These AMIs are pre-configured with a number of STIG standards to help you get started with your deployments

while meeting STIG compliance standards. For more information, see [STIG Hardened Amazon EC2 Windows Server AMIs](#).

Audit and accountability in Amazon EC2

AWS CloudTrail, AWS Config, and AWS Config Rules provide audit and change tracking features for auditing AWS resource changes. Configure Windows event logs to send local log files to a centralized log management system to preserve log data for security and operational behavior analysis. Microsoft System Center Operations Manager (SCOM) aggregates information about Microsoft applications deployed to Windows instances and applies preconfigured and custom rulesets based on application roles and services. System Center Management Packs build on SCOM to provide application-specific monitoring and configuration guidance. These [Management Packs](#) support Windows Server Active Directory, SharePoint Server 2013, Exchange Server 2013, Lync Server 2013, SQL Server 2014, and many more servers and technologies. The AWS Management Pack for Microsoft System Center Operations Manager (SCOM) and the Systems Manager for Microsoft System Center Virtual Machine Manager (SCVMM) integrate with Microsoft Systems Center to help you monitor and manage your on-premises and AWS environments together.

In addition to Microsoft systems management tools, customers can use Amazon CloudWatch to monitor instance CPU utilization, disk performance, network I/O, and perform host and instance status checks. The EC2Config and EC2Launch services provide access to additional, advanced features for Windows instances. For example, they can export Windows system, security, application, and Internet Information Services (IIS) logs to CloudWatch Logs which can then be integrated with Amazon CloudWatch metrics and alarms. Customers can also create scripts that export Windows performance counters to Amazon CloudWatch custom metrics.

NitroTPM

Nitro Trusted Platform Module (NitroTPM) is a virtual device that is provided by the [AWS Nitro System](#) and conforms to the [TPM 2.0 specification](#). It securely stores artifacts (such as passwords, certificates, or encryption keys) that are used to authenticate the instance. NitroTPM can generate keys and use them for cryptographic functions (such as hashing, signing, encryption, and decryption).

NitroTPM provides *measured boot*, a process where the bootloader and operating system create cryptographic hashes of every boot binary and combine them with the previous values in NitroTPM internal Platform Configuration Registers (PCRs). With measured boot, you can obtain signed PCR

values from NitroTPM and use them to prove to remote entities the integrity of the instance's boot software. This is known as remote *attestation*.

With NitroTPM, keys and secrets can be tagged with a specific PCR value so that they can never be accessed if the value of the PCR, and thus the instance integrity, changes. This special form of conditional access is referred to as *sealing and unsealing*. Operating system technologies, like [BitLocker](#), can use NitroTPM to seal a drive decryption key so that the drive can only be decrypted when the operating system has booted correctly and is in a known good state.

To use NitroTPM, you must select an [Amazon Machine Image](#) (AMI) that has been configured for NitroTPM support, and then use the AMI to launch [instances built on the AWS Nitro System](#). You can select one of Amazon's prebuilt AMIs or create one yourself.

Costs

There is no additional cost for using NitroTPM. You pay only for the underlying resources that you use.

Topics

- [Considerations](#)
- [Prerequisites for launching Windows instances](#)
- [Verify whether an AMI is enabled for NitroTPM](#)
- [Enable or stop using NitroTPM on an instance](#)

Considerations

The following considerations apply when using NitroTPM:

- BitLocker volumes that are encrypted with NitroTPM-based keys can only be used on the original instance.
- The NitroTPM state is not included in [Amazon EBS snapshots](#).
- The NitroTPM state is not included in [VM Import/Export](#) images.
- NitroTPM support is enabled by specifying a value of v2.0 for the tpm-support parameter when creating an AMI. After you launch an instance with the AMI, you can't modify the attributes on the instance. Instances with NitroTPM do not support the [ModifyInstanceAttribute](#) API.
- You can only create an AMI with NitroTPM configured by using the [RegisterImage](#) API by using the AWS CLI and not with the Amazon EC2 console.

- NitroTPM is not supported on Outposts.
- NitroTPM is not supported in Local Zones or Wavelength Zones.

Prerequisites for launching Windows instances

To launch a Windows instance with NitroTPM enabled, the following prerequisites must be in place.

For the prerequisites for launching a Linux instance, see [Prerequisites for launching Linux instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

AMI

Requires an AMI with NitroTPM enabled.

The following Windows AMIs are preconfigured to enable NitroTPM and UEFI Secure Boot with Microsoft keys:

- TPM-Windows_Server-2022-English-Core-Base
- TPM-Windows_Server-2022-English-Full-Base
- TPM-Windows_Server-2022-English-Full-SQL_2022_Enterprise
- TPM-Windows_Server-2022-English-Full-SQL_2022_Standard
- TPM-Windows_Server-2019-English-Core-Base
- TPM-Windows_Server-2019-English-Full-Base
- TPM-Windows_Server-2019-English-Full-SQL_2019_Enterprise
- TPM-Windows_Server-2019-English-Full-SQL_2019_Standard
- TPM-Windows_Server-2016-English-Core-Base
- TPM-Windows_Server-2016-English-Full-Base

Currently, we do not support importing Windows with NitroTPM by using the [import-image](#) command.

Operating system

The AMI must include an operating system with a TPM 2.0 Command Response Buffer (CRB) driver. Most current operating systems, such as TPM-Windows_Server-2022-English-Full-Base, contain a TPM 2.0 CRB driver.

Instance type

Supported virtualized instance types:

- **General purpose:** M5, M5a, M5ad, M5d, M5dn, M5n, M5zn, M6a, M6i, M6id, M6idn, M6in, M7a, M7i, M7i-flex, T3, T3a
- **Compute optimized:** C5, C5a, C5ad, C5d, C5n, C6a, C6i, C6id, C6in, C7a, C7i
- **Memory optimized:** R5, R5a, R5ad, R5b, R5d, R5dn, R5n, R6a, R6i, R6idn, R6in, R6id, R7a, R7i, R7iz, z1d
- **Storage optimized:** D3, D3en, I3en, I4i
- **Accelerated computing:** G4dn, G5
- **High-performance computing:** Hpc6id

Not supported: Graviton-based instances, Xen instances, Mac instances, and bare metal instances

UEFI boot mode

NitroTPM requires that an instance runs in UEFI boot mode, which requires that the AMI must be configured for UEFI boot mode. For more information, see [UEFI Secure Boot](#).

Verify whether an AMI is enabled for NitroTPM

You can use either `describe-images` or `describe-image-attributes` to verify whether an AMI is enabled for NitroTPM.

To verify whether an AMI is enabled for NitroTPM using `describe-images`

Use the [`describe-images`](#) command and specify the AMI ID.

```
aws ec2 describe-images --image-ids ami-0123456789example
```

If NitroTPM is enabled for the AMI, "TpmSupport": "v2.0" appears in the output.

```
{  
    "Images": [  
        {  
            ...  
            "BootMode": "uefi",  
            ...  
            "TpmSupport": "v2.0"  
        }  
    ]  
}
```

```
]  
}
```

To verify whether an AMI is enabled for NitroTPM using `describe-image-attribute`

Use the [describe-image-attribute](#) command and specify the attribute parameter with the `tpmSupport` value.

 **Note**

You must be the AMI owner to call `describe-image-attribute`.

```
aws ec2 describe-image-attribute \  
  --region us-east-1 \  
  --image-id ami-0123456789example \  
  --attribute tpmSupport
```

If NitroTPM is enabled for the AMI, the value for `TpmSupport` is "v2.0". Note that `describe-image-attribute` only returns the attributes that are specified in the request.

```
{  
    "ImageId": "ami-0123456789example",  
    "TpmSupport": {  
        "Value": "v2.0"  
    }  
}
```

Enable or stop using NitroTPM on an instance

When you launch an instance from an AMI that has NitroTPM support enabled, the instance launches with NitroTPM enabled. You can configure the instance to stop using NitroTPM. You can verify whether an instance is enabled for NitroTPM.

Topics

- [Launch an instance with NitroTPM enabled](#)
- [Stop using NitroTPM on an instance](#)
- [Verify whether NitroTPM is accessible inside the instance](#)

Launch an instance with NitroTPM enabled

When you launch an instance with the [prerequisites](#), NitroTPM is automatically enabled on the instance. You can only enable NitroTPM on an instance at launch. For information about launching an instance, see [Launch your instance](#).

Stop using NitroTPM on an instance

After launching an instance with NitroTPM enabled, you can't disable NitroTPM for the instance. However, you can configure the operating system to stop using NitroTPM by disabling the TPM 2.0 device driver on the instance by using the following tools:

- For Windows, use the TPM management console, tpm.msc.

For more information about disabling the device driver, see the documentation for your operating system.

Verify whether NitroTPM is accessible inside the instance

To verify whether an instance is enabled for NitroTPM support using the AWS CLI

Use the [describe-instances](#) AWS CLI command and specify the instance ID. Currently, the Amazon EC2 console does not display the TpmSupport field.

```
aws ec2 describe-instances --instance-ids i-0123456789example
```

If NitroTPM support is enabled on the instance, "TpmSupport": "v2.0" appears in the output.

```
"Instances": {  
    "InstanceId": "0123456789example",  
    "InstanceType": "c5.large",  
    ...  
    "BootMode": "uefi",  
    "TpmSupport": "v2.0"  
    ...  
}
```

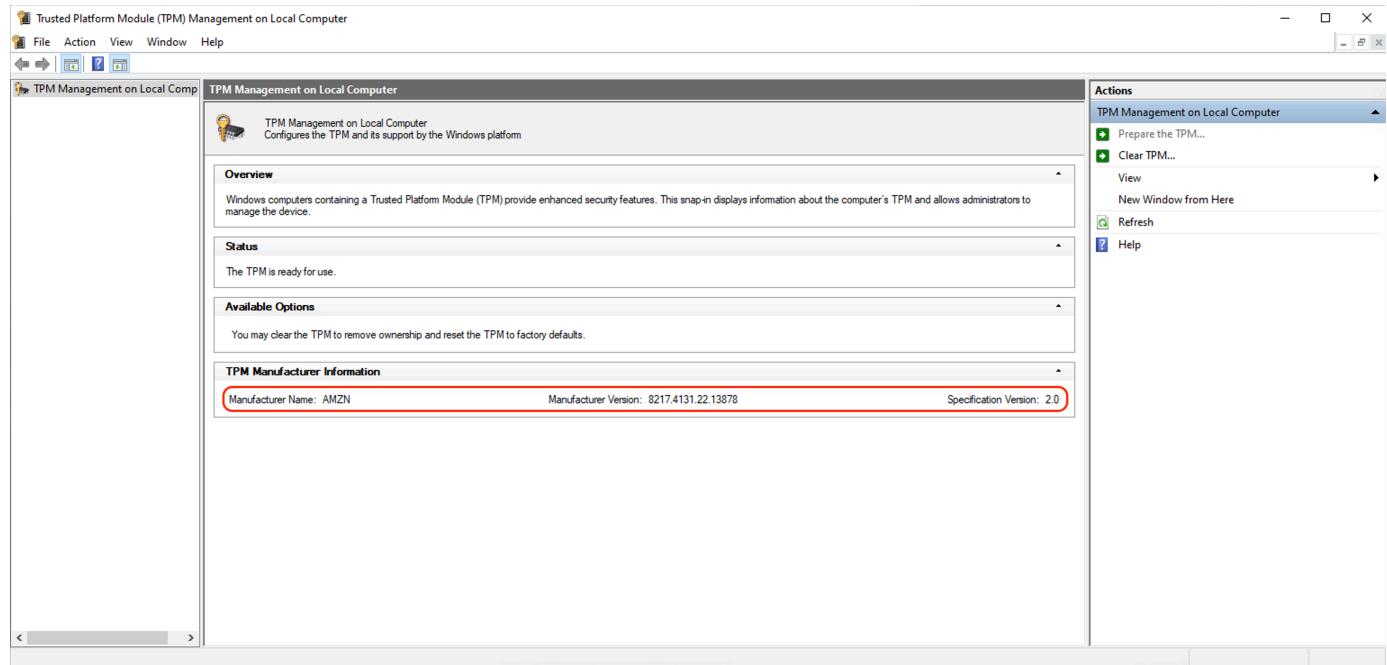

To verify whether NitroTPM is accessible inside an Amazon EC2 Windows instance

1. [Connect to your EC2 Windows instance.](#)

2. On the instance, run the tpm.msc program.

The **TPM Management on Local Computer** window opens.

3. Check the **TPM Manufacturer Information** field. It contains the manufacturer's name and the version of the NitroTPM on the instance.

Storage options for your Amazon EC2 instances

Amazon EC2 provides you with flexible, cost effective, and easy-to-use data storage options for your instances. Each option has a unique combination of performance and durability. These storage options can be used independently or in combination to suit your requirements.

Amazon EBS

Amazon EBS provides durable, block-level storage volumes that you can attach and detach from your instances. You can attach multiple EBS volumes to an instance. An EBS volume persists independently from the life of its associated instance. You can encrypt your EBS volumes. To keep a backup copy of your data, you can create snapshots from your EBS volumes. Snapshots are stored in Amazon S3. You can create an EBS volume from a snapshot.

Instance store

Instance store provides temporary block-level storage for instances. The number, size, and type of instance store volumes are determined by the instance type and instance size. The data on an instance store volume persists only during the life of the associated instance; if you stop, hibernate, or terminate an instance, any data on instance store volumes is lost.

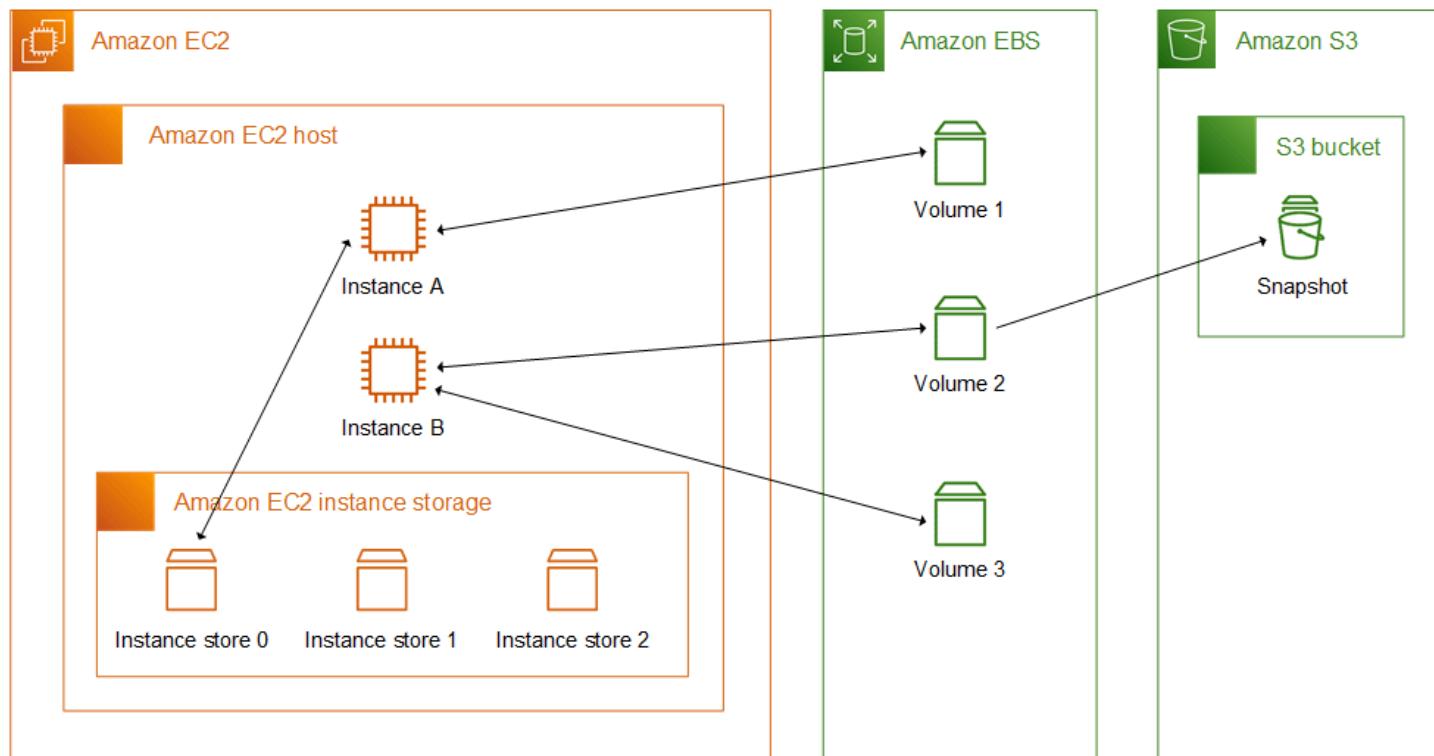

Amazon S3

Amazon S3 provides access to reliable and inexpensive data storage infrastructure. It is designed to make web-scale computing easier by enabling you to store and retrieve any amount of data, at any time, from within Amazon EC2 or anywhere on the web. For example, you can use Amazon S3 to store backup copies of your data and applications. Amazon EC2 uses Amazon S3 to store EBS snapshots and instance store-backed AMIs.

Amazon FSx

With Amazon FSx, you can launch, run, and scale feature-rich, high-performance file systems in the cloud. Amazon FSx is a fully-managed service that supports a wide range of workloads. You can choose between these widely-used file systems: Lustre, NetApp ONTAP, OpenZFS, and Windows File Server.

The following figure shows the relationship between these storage options and your instance.

Storage pricing

Open [AWS Pricing](#), scroll to **Pricing for AWS products** and select **Storage**. Choose the storage product to open its pricing page.

Use Amazon EBS with Amazon EC2

Amazon Elastic Block Store (Amazon EBS) provides scalable, high-performance block storage resources that can be used with Amazon Elastic Compute Cloud (Amazon EC2) instances. With Amazon EBS, you can create and manage the following block storage resources:

- **Amazon EBS volumes** — These are storage volumes that you attach to Amazon EC2 instances. After you attach a volume to an instance, you can use it in the same way you would use block storage. The instance can interact with the volume just as it would with a local drive.
- **Amazon EBS snapshots** — These are point-in-time backups of Amazon EBS volumes that persist independently from the volume itself. You can create snapshots to back up the data on your Amazon EBS volumes. You can then restore new volumes from those snapshots at any time.

You can create and attach Amazon EBS volumes to an instance during launch, and you can create and attach EBS volumes to an instance at any time after launch. And you can create snapshots from a volume at any time after creation.

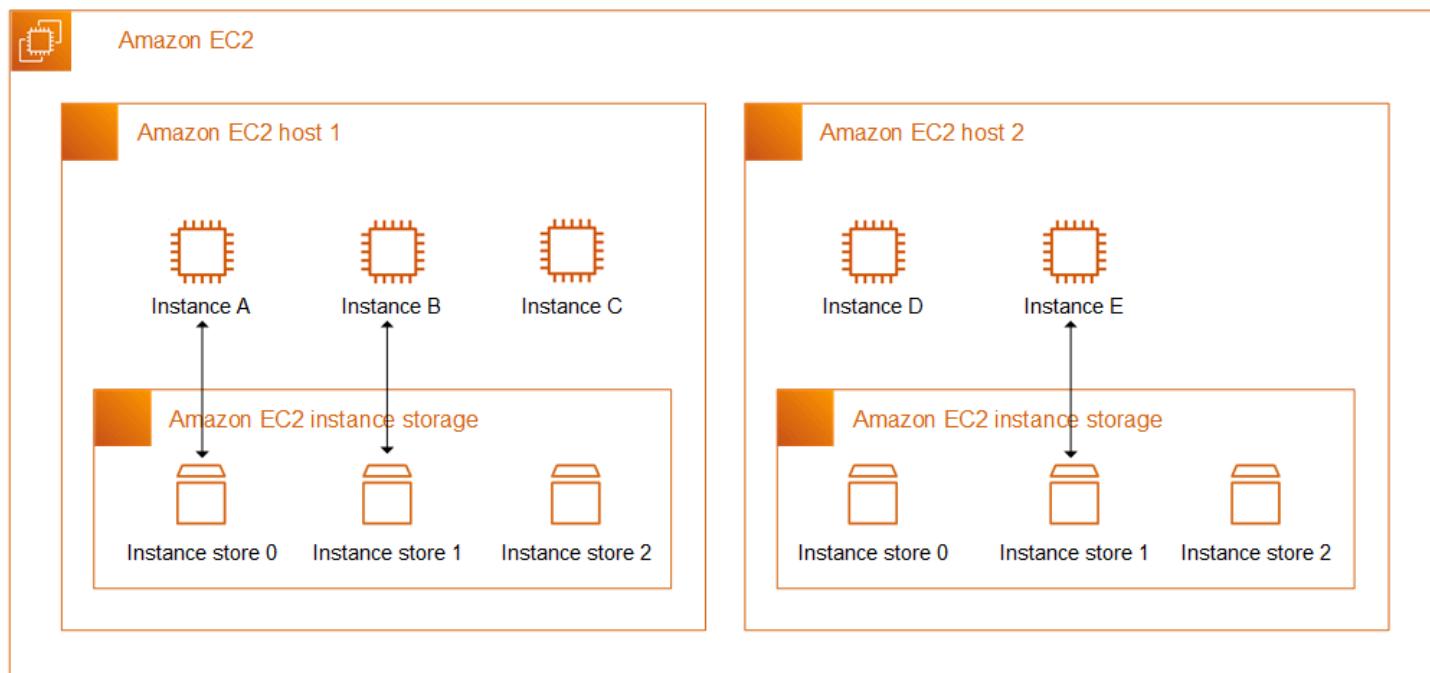

For more information about working with volumes and snapshots, see the [Amazon EBS User Guide](#).

Amazon EC2 instance store

An *instance store* provides temporary block-level storage for your instance. This storage is located on disks that are physically attached to the host computer. Instance store is ideal for temporary storage of information that changes frequently, such as buffers, caches, scratch data, and other temporary content. It can also be used to store temporary data that you replicate across a fleet of instances, such as a load-balanced pool of web servers.

An instance store consists of one or more instance store volumes exposed as block devices. The size of an instance store as well as the number of devices available varies by instance type and instance size. For more information, see [Instance store volumes](#).

The virtual devices for instance store volumes are ephemeral[0-23]. Instance types that support one instance store volume have ephemeral0. Instance types that support two or more instance store volumes have ephemeral0, ephemeral1, and so on.

Instance store pricing

Instance store volumes are included as part of the instance's usage cost.

Contents

- [Instance store volume and data lifetime](#)
- [Instance store volumes](#)
- [Add instance store volumes to your EC2 instance](#)
- [SSD instance store volumes](#)

Instance store volume and data lifetime

The number, size, and type of instance store volumes are determined by the instance type and instance size. For more information, see [Instance store volumes](#).

Instance store volumes are attached only at instance launch. You can't attach instance store volumes after launch. You can't detach an instance store volume from one instance and attach it to a different instance.

An instance store volume exists only during the lifetime of the instance to which it is attached. You can't configure an instance store volume to persist beyond the lifetime of its associated instance.

The data on an instance store volume persists even if the instance is rebooted. However, the data does not persist if the instance is stopped, hibernated, or terminated. When the instance is stopped, hibernated, or terminated, every block of the instance store volume is cryptographically erased.

Therefore, do not rely on instance store volumes for valuable, long-term data. If you need to retain the data stored on an instance store volume beyond the lifetime of the instance, you need to manually copy that data to more persistent storage, such as an Amazon EBS volume, an Amazon S3 bucket, or an Amazon EFS file system.

There are some events that can result in your data not persisting throughout the lifetime of the instance. The following table indicates whether data on instance store volumes is persisted during specific events, for both virtualized and bare metal instances.

Event	What happens to your data?
User-initiated instance lifecycle events	

Event	What happens to your data?
<u>The instance is rebooted</u>	The data persists
<u>The instance is stopped</u>	The data does not persist
<u>The instance is hibernated</u>	The data does not persist
<u>The instance is terminated</u>	The data does not persist
<u>The instance type is changed</u>	The data does not persist *
<u>A Windows AMI is created from the instance</u>	The data does not persist in the created AMI **
<u>An EBS-backed AMI is created from the instance</u>	The data does not persist in the created AMI **
<u>An instance store-backed AMI is created from the instance</u>	The data persists in the AMI bundle uploaded to Amazon S3 ***
User-initiated OS events	
A shutdown is initiated	The data does not persist †
A restart is initiated	The data persists
AWS scheduled events	
<u>Instance stop</u>	The data does not persist
<u>Instance reboot</u>	The data persists
<u>System reboot</u>	The data persists
<u>Instance retirement</u>	The data does not persist
Unplanned events	
<u>Simplified automatic recovery</u>	The data does not persist
<u>CloudWatch action based recovery</u>	The data does not persist

Event	What happens to your data?
The underlying disk fails	The data on the failed disk does not persist
Power failure	The data persists upon reboot

* If the new instance type supports instance store, the instance gets the number of instance store volumes supported by the new instance type, but the data does not transfer to the new instance. If the new instance type does not support instance store, the instance does not get the instance store volumes.

** The data is not included in the EBS-backed AMI, and it is not included on instance store volumes attached to instances launched from that AMI.

*** The data is included in the AMI bundle that is uploaded to Amazon S3. When you launch an instance from that AMI, the instance gets the instance store volumes bundled in the AMI with the data they contained at the time the AMI was created.

† Termination protection and stop protection do not protect instances against instance stops or terminations as a result of shutdowns initiated through the operating system on the instance. Data stored on instance store volumes does not persist in both instance stop and termination events.

Instance store volumes

The number, size, and type of instance store volumes are determined by the instance type and instance size. Some instance types, such as M6, C6, and R6, do not support instance store volumes, while other instance types, such as M5d, C6gd, and R6gd, do support instance store volumes. You can't attach more instance store volumes to an instance than is supported by its instance type. For the instance types that do support instance store volumes, the number and size of the instance store volumes vary by instance size. For example, m5d.large supports 1 x 75 GB instance store volume, while m5d.24xlarge supports 4 x 900 GB instance store volumes.

For instance types with **NVMe instance store volumes**, all of the supported instance store volumes are automatically attached to the instance at launch. For instance types with **non-NVMe instance store volumes**, such as C1, C3, M1, M2, M3, R3, D2, H1, I2, X1, and X1e, you must manually specify the block device mappings for the instance store volumes that you want to attach at launch. Then, after the instance has launched, you must [format and mount the attached instance store volumes](#) before you can use them. You can't attach an instance store volume after you launch the instance.

Some instance types use NVMe or SATA-based solid state drives (SSD), while others use SATA-based hard disk drives (HDD). SSDs deliver high random I/O performance with very low latency, but you don't need the data to persist when the instance terminates or you can take advantage of fault-tolerant architectures. For more information, see [SSD instance store volumes](#).

The data on NVMe instance store volumes and some HDD instance store volumes is encrypted at rest. For more information, see [Data protection in Amazon EC2](#).

Available instance store volumes

The *Amazon EC2 Instance Types Guide* provides the quantity, size, type, and performance optimizations of instance store volumes available on each supported instance type. For more information, see the following:

- [Instance store specifications – General purpose](#)
- [Instance store specifications – Compute optimized](#)
- [Instance store specifications – Memory optimized](#)
- [Instance store specifications – Storage optimized](#)
- [Instance store specifications – Accelerated computing](#)
- [Instance store specifications – High-performance computing](#)
- [Instance store specifications – Previous generation](#)

To retrieve instance store volume information using the AWS CLI

You can use the [describe-instance-types](#) AWS CLI command to display information about an instance type, such as its instance store volumes. The following example displays the total size of instance storage for all R5 instances with instance store volumes.

```
aws ec2 describe-instance-types \
    --filters "Name=instance-type,Values=r5*" "Name=instance-storage-
supported,Values=true" \
    --query "InstanceTypes[].[InstanceType, InstanceStorageInfo.TotalSizeInGB]" \
    --output table
```

Example output

```
-----  
| DescribeInstanceTypes |
```

r5ad.24xlarge 3600		
r5ad.12xlarge 1800		
r5dn.8xlarge 1200		
r5ad.8xlarge 1200		
r5ad.large 75		
r5d.4xlarge 600		
. . .		
r5dn.2xlarge 300		
r5d.12xlarge 1800		
+-----+-----+		

The following example displays the complete instance storage details for the specified instance type.

```
aws ec2 describe-instance-types \
--filters "Name=instance-type,Values=r5d.4xlarge" \
--query "InstanceTypes[0].InstanceStorageInfo"
```

The example output shows that this instance type has two 300 GB NVMe SSD volumes, for a total of 600 GB of instance storage.

```
[  
 {  
     "TotalSizeInGB": 600,  
     "Disks": [  
         {  
             "SizeInGB": 300,  
             "Count": 2,  
             "Type": "ssd"  
         }  
     ],  
     "NvmeSupport": "required"  
 }  
 ]
```

Add instance store volumes to your EC2 instance

For instance types with **NVMe instance store volumes**, all of the supported instance store volumes are automatically attached to the instance at launch. They are automatically enumerated and assigned a device name on instance launch.

For instance types with **non-NVMe instance store volumes**, such as C1, C3, M1, M2, M3, R3, D2, H1, I2, X1, and X1e, you must manually specify the block device mappings for the instance store volumes that you want to attach at launch. Block device mappings can be specified in the instance launch request or in the AMI used to launch the instance. The block device mapping includes a device name and the volume that it maps to. For more information, see [Block device mappings](#)

Important

Instance store volumes can be attached to an instance only when you launch it. You can't attach instance store volumes to an instance after you've launched it.

After you launch an instance, you must ensure that the instance store volumes for your instance are formatted and mounted before you can use them. The root volume of an instance store-backed instance is mounted automatically.

Consideration for root volumes

A block device mapping always specifies the root volume for the instance. The root volume is mounted automatically. For Windows instances, the root volume must be an Amazon EBS volume; instance store is not supported for the root volume.

Contents

- [Add instance store volumes to an AMI](#)
- [Add non-NVME instance store volumes to an instance](#)
- [Make instance store volumes available on your instance](#)

Add instance store volumes to an AMI

You can create an AMI with a block device mapping that includes instance store volumes.

If you launch an instance that supports **non-NVMe instance store volumes** using an AMI that specifies instance store volume block device mappings, the instance includes the instance store volumes. If the number of instance store volume block device mappings in the AMI exceeds the number of instance store volumes available to the instance, the additional instance store volume block device mappings are ignored.

If you launch an instance that supports **NVMe instance store volumes** using an AMI that specifies instance store volume block device mappings, the instance store volume block device mappings are

ignored. Instances that support NVMe instance store volumes get all of their supported instance store volumes, regardless of the block device mappings specified in the instance launch request and the AMI.

Considerations

- For M3 instances, specify instance store volumes in the block device mapping of the instance, not the AMI. Amazon EC2 might ignore instance store volume block device mappings in the AMI.
- When you launch an instance, you can omit non-NVMe instance store volumes specified in the AMI block device mapping or add instance store volumes.

New console

To add instance store volumes to an Amazon EBS-backed AMI using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select the instance.
3. Choose **Actions, Image and templates, Create image**.
4. On the **Create image** page, enter a meaningful name and description for your image.
5. For each instance store volume to add, choose **Add volume**, from **Volume type** select an instance store volume, and from **Device** select a device name. (For more information, see [Device names on Windows instances](#).) The number of available instance store volumes depends on the instance type. For instances with NVMe instance store volumes, the device mapping of these volumes depends on the order in which the operating system enumerates the volumes.
6. Choose **Create image**.

AWS CLI

To add instance store volumes to an AMI using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [create-image](#) or [register-image](#) (AWS CLI)
- [New-EC2Image](#) and [Register-EC2Image](#) (AWS Tools for Windows PowerShell)

Add non-NVMe instance store volumes to an instance

When you launch an instance that supports **non-NVMe instance store volumes** you must specify block device mappings for the instance store volumes to attach. The block device mappings must be specified in the instance launch request or in the AMI used to launch the instance.

If the AMI includes block device mappings for the instance store volumes, you do not need to specify block device mappings in the instance launch request, unless you need more instance store volumes than is included in the AMI.

If the AMI does not include block device mappings for instance store volumes, then you must specify the block device mappings in the instance launch request.

Considerations

- For M3 instances, you might receive instance store volumes even if you do not specify them in the block device mapping for the instance.

To specify block device mappings in the instance launch request, use one of the following methods.

Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the dashboard, choose **Launch instance**.
3. In the **Application and OS Images** section, select the AMI to use.
4. In the **Configure storage** section, the **Instance store volumes** section lists the instance store volumes that can be attached to the instance. The number of available instance store volumes depends on the instance type.
5. For each instance store volume to attach, for **Device name**, select the device name to use.
6. Configure the remaining instance settings as needed, and then choose **Launch instance**.

Command line

You can use one of the following options commands with the corresponding option.

- --block-device-mappings with [run-instances](#) (AWS CLI)
- -BlockDeviceMapping with [New-EC2Instance](#) (AWS Tools for Windows PowerShell)

Make instance store volumes available on your instance

After you launch an instance with attached instance store volumes, you must mount the volumes before you can access them.

For Linux instances, many instance store volumes are pre-formatted with the ext3 file system. SSD-based instance store volumes that support TRIM instruction are not pre-formatted with any file system. However, you can format volumes with the file system of your choice after you launch your instance. For more information, see [Instance store volume TRIM support](#). For Windows instances, we reformat the instance store volumes with the NTFS file system.

You can confirm that the instance store devices are available from within the instance itself using instance metadata. For more information, see [View the instance block device mapping for instance store volumes](#).

For Windows instances, you can also view the instance store volumes using Windows Disk Management. For more information, see [List disks using Disk Management](#).

To manually mount an instance store volume

1. Choose **Start**, enter **Computer Management**, and then press **Enter**.
2. In left-hand panel, choose **Disk Management**.
3. If you are prompted to initialize the volume, choose the volume to initialize, select the required partition type depending on your use case, and then choose **OK**.
4. In the list of volumes, right-click the volume to mount, and then choose **New Simple Volume**.
5. On the wizard, choose **Next**.
6. On the Specify Volume Size screen, choose **Next** to use the maximum volume size. Alternatively, choose a volume size that is between the minimum and maximum disk space.
7. On the Assign a Drive Letter or Path screen, do one of the following, and choose **Next**.
 - To mount the volume with a drive letter, choose **Assign the following drive letter** and then choose the drive letter to use.
 - To mount the volume as a folder, choose **Mount in the following empty NTFS folder** and then choose **Browse** to create or select the folder to use.
 - To mount the volume without a drive letter or path, choose **Do not assign a drive letter or drive path**.

8. On the Format Partition screen, specify whether or not to format the volume. If you choose to format the volume, choose the required file system and unit size, and specify a volume label.
9. Choose **Next, Finish**.

SSD instance store volumes

Like other instance store volumes, you must map the SSD instance store volumes for your instance when you launch it. The data on an SSD instance volume persists only for the life of its associated instance. For more information, see [Add instance store volumes to your EC2 instance](#).

NVMe SSD volumes

Some instances offer non-volatile memory express (NVMe) solid state drives (SSD) instance store volumes. For more information about the type of instance store volume supported by each instance type, see [Instance store volumes](#).

The latest AWS Windows AMIs for the following operating systems contain the AWS NVMe drivers used to interact with SSD instance store volumes that are exposed as NVMe block devices for better performance:

- Windows Server 2019
- Windows Server 2016
- Windows Server 2012 R2
- Windows Server 2012
- Windows Server 2008 R2

After you connect to your instance, you can verify that you see the NVMe volumes in Disk Manager. On the taskbar, open the context (right-click) menu for the Windows logo and choose **Disk Management**. On Windows Server 2008 R2, choose **Start, Administrative Tools, Computer Management, Disk Management**.

The AWS Windows AMIs provided by Amazon include the AWS NVMe driver. If you are not using the latest AWS Windows AMIs, you can [install the current AWS NVMe driver](#).

The data on NVMe instance storage is encrypted using an XTS-AES-256 block cipher implemented in a hardware module on the instance. The encryption keys are generated using the hardware

module and are unique to each NVMe instance storage device. All encryption keys are destroyed when the instance is stopped or terminated and cannot be recovered. You cannot disable this encryption and you cannot provide your own encryption key.

Non-NVMe SSD volumes

The following instances support instance store volumes that use non-NVMe SSDs to deliver high random I/O performance: C3, I2, M3, R3, and X1. For more information about the instance store volumes supported by each instance type, see [Instance store volumes](#).

SSD-based instance store volume I/O performance

As you fill the SSD-based instance store volumes for your instance, the number of write IOPS that you can achieve decreases. This is due to the extra work the SSD controller must do to find available space, rewrite existing data, and erase unused space so that it can be rewritten. This process of garbage collection results in internal write amplification to the SSD, expressed as the ratio of SSD write operations to user write operations. This decrease in performance is even larger if the write operations are not in multiples of 4,096 bytes or not aligned to a 4,096-byte boundary. If you write a smaller amount of bytes or bytes that are not aligned, the SSD controller must read the surrounding data and store the result in a new location. This pattern results in significantly increased write amplification, increased latency, and dramatically reduced I/O performance.

SSD controllers can use several strategies to reduce the impact of write amplification. One such strategy is to reserve space in the SSD instance storage so that the controller can more efficiently manage the space available for write operations. This is called *over-provisioning*. The SSD-based instance store volumes provided to an instance do not have any space reserved for over-provisioning. To reduce write amplification, we recommend that you leave 10 percent of the volume unpartitioned so that the SSD controller can use it for over-provisioning. This decreases the storage that you can use, but increases performance even if the disk is close to full capacity.

For instance store volumes that support TRIM, you can use the TRIM command to notify the SSD controller whenever you no longer need data that you have written. This provides the controller with more free space, which can reduce write amplification and increase performance. For more information, see [Instance store volume TRIM support](#).

Instance store volume TRIM support

Some instance types support SSD volumes with TRIM. For more information, see [Instance store volumes](#).

Instances running Windows Server 2012 R2 support TRIM as of AWS PV Driver version 7.3.0.

Instances running earlier versions of Windows Server do not support TRIM.

Instance store volumes that support TRIM are fully trimmed before they are allocated to your instance. These volumes are not formatted with a file system when an instance launches, so you must format them before they can be mounted and used. For faster access to these volumes, you should skip the TRIM operation when you format them. On Windows, to temporarily disable TRIM support during initial formatting, use the `fsutil behavior set DisableDeleteNotify 1` command. After formatting is complete, re-enable TRIM support by using `fsutil behavior set DisableDeleteNotify 0`.

With instance store volumes that support TRIM, you can use the TRIM command to notify the SSD controller when you no longer need data that you've written. This provides the controller with more free space, which can reduce write amplification and increase performance. On Windows, use the `fsutil behavior set DisableDeleteNotify 0` command to ensure TRIM support is enabled during normal operation.

File storage

Cloud file storage is a method for storing data in the cloud that provides servers and applications access to data through shared file systems. This compatibility makes cloud file storage ideal for workloads that rely on shared file systems and provides simple integration without code changes.

There are many file storage solutions that exist, ranging from a single node file server on a compute instance using block storage as the underpinnings with no scalability or few redundancies to protect the data, to a do-it-yourself clustered solution, to a fully-managed solution. The following content introduces some of the storage services provided by AWS for use with Windows.

Contents

- [Use Amazon S3 with Amazon EC2](#)
- [Use Amazon EFS with Amazon EC2](#)
- [Use Amazon FSx with Amazon EC2](#)
- [Use Amazon File Cache with Amazon EC2](#)

Use Amazon S3 with Amazon EC2

Amazon Simple Storage Service (Amazon S3) is an object storage service that offers industry-leading scalability, data availability, security, and performance. You can use Amazon S3 to store and retrieve any amount of data for a range of use cases, such as data lakes, websites, backups, and big data analytics, from an Amazon EC2 instance or from anywhere over the internet. For more information, see [What is Amazon S3?](#)

Objects are the fundamental entities stored in Amazon S3. Every object stored in Amazon S3 is contained in a bucket. Buckets organize the Amazon S3 namespace at the highest level and identify the account responsible for that storage. Amazon S3 buckets are similar to internet domain names. Objects stored in the buckets have a unique key value and are retrieved using a URL. For example, if an object with a key value /photos/mygarden.jpg is stored in the *DOC-EXAMPLE-BUCKET1* bucket, then it is addressable using the URL <https://DOC-EXAMPLE-BUCKET1.s3.amazonaws.com/photos/mygarden.jpg>. For more information, see [How Amazon S3 works](#).

Usage examples

Given the benefits of Amazon S3 for storage, you might decide to use this service to store files and data sets for use with EC2 instances. There are several ways to move data to and from Amazon S3 to your instances. In addition to the examples discussed below, there are a variety of tools that people have written that you can use to access your data in Amazon S3 from your computer or your instance. Some of the common ones are discussed in the AWS forums.

If you have permission, you can copy a file to or from Amazon S3 and your instance using one of the following methods.

AWS Tools for Windows PowerShell

Windows instances have the benefit of a graphical browser that you can use to access the Amazon S3 console directly; however, for scripting purposes, Windows users can also use the [AWS Tools for Windows PowerShell](#) to move objects to and from Amazon S3.

Use the following command to copy an Amazon S3 object to your Windows instance.

```
PS C:\> Copy-S3Object -BucketName my_bucket -Key path-to-file -  
LocalFile my_copied_file.ext
```

AWS Command Line Interface

The AWS Command Line Interface (AWS CLI) is a unified tool to manage your AWS services. The AWS CLI enables users to authenticate themselves and download restricted items from Amazon S3 and also to upload items. For more information, such as how to install and configure the tools, see the [AWS Command Line Interface detail page](#).

The **aws s3 cp** command is similar to the Unix **cp** command. You can copy files from Amazon S3 to your instance, copy files from your instance to Amazon S3, and copy files from one Amazon S3 location to another.

Use the following command to copy an object from Amazon S3 to your instance.

```
aws s3 cp s3://my_bucket/my_folder/my_file.ext my_copied_file.ext
```

Use the following command to copy an object from your instance back into Amazon S3.

```
aws s3 cp my_copied_file.ext s3://my_bucket/my_folder/my_file.ext
```

The **aws s3 sync** command can synchronize an entire Amazon S3 bucket to a local directory location. This can be helpful for downloading a data set and keeping the local copy up-to-date with the remote set. If you have the proper permissions on the Amazon S3 bucket, you can push your local directory back up to the cloud when you are finished by reversing the source and destination locations in the command.

Use the following command to download an entire Amazon S3 bucket to a local directory on your instance.

```
aws s3 sync s3://remote_S3_bucket local_directory
```

Amazon S3 API

If you are a developer, you can use an API to access data in Amazon S3. For more information, see the [Amazon Simple Storage Service User Guide](#). You can use this API and its examples to help develop your application and integrate it with other APIs and SDKs, such as the boto Python interface.

Use Amazon EFS with Amazon EC2

Note

Amazon EFS is not supported on Windows instances. To use Amazon EFS with a Linux instance, see [Amazon Elastic File System \(Amazon EFS\)](#) in the *Amazon EC2 User Guide for Linux Instances*.

Amazon EFS provides scalable file storage for use with Amazon EC2. You can use an EFS file system as a common data source for workloads and applications running on multiple instances. For more information, see the [Amazon Elastic File System product page](#).

Note

When you create an EFS file system using EFS Quick Create, the file system is created with the following service recommended settings:

- [Automatic backups enabled](#).
- [Mount targets in each default subnet](#) in the selected VPC.
- [General Purpose performance mode](#).
- [Bursting throughput mode](#).
- [Encryption of data at rest enabled](#) using your default key for Amazon EFS (aws/elasticfilesystem).
- [Amazon EFS lifecycle management enabled](#) with a 30-day policy.

Use Amazon FSx with Amazon EC2

The Amazon FSx family of services makes it easy to launch, run, and scale shared storage powered by popular commercial and open-source file systems. You can use the *new launch instance wizard* to automatically attach the following types of Amazon FSx file systems to your Amazon EC2 instances at launch:

- Amazon FSx for NetApp ONTAP provides fully managed shared storage in the AWS Cloud with the popular data access and management capabilities of NetApp ONTAP.

- Amazon FSx for OpenZFS provides fully managed cost-effective shared storage powered by the popular OpenZFS file system.

Note

- This functionality is available in the new launch instance wizard only. For more information, see [Launch an instance using the new launch instance wizard](#)
- Amazon FSx for Windows File Server and Amazon FSx for Lustre file systems can't be mounted at launch. You must mount these file systems manually after launch.

You can choose to mount an existing file system that you created previously, or you can create a new file system to mount to an instance at launch.

Topics

- [Security groups and user data script](#)
- [Mount an Amazon FSx file system at launch](#)

Security groups and user data script

When you mount an Amazon FSx file system to an instance using the launch instance wizard, you can choose whether to automatically create and attach the security groups needed to enable access to the file system, and whether to automatically include the user data scripts needed to mount the file system and make it available for use.

Topics

- [Security groups](#)
- [User data script](#)

Security groups

If you choose to automatically create the security groups that are needed to enable access to the file system, the launch instance wizard creates and attaches two security groups - one security group is attached to the instance, and the other is attached to the file system. For more information about the security group requirements, see [FSx for ONTAP file system access control with Amazon VPC](#) and [FSx for OpenZFS file system access control with Amazon VPC](#).

We add the tag Name=instance-sg-**1** to the security group that is created and attached to the instance. The value in the tag is automatically incremented each time the launch instance wizard creates a security group for Amazon FSx file systems.

The security group includes the following output rules, but no inbound rules.

Outbound rules

Protocol type	Port number	Destination
UDP	111	<i>file system security group</i>
UDP	20001 - 20003	<i>file system security group</i>
UDP	4049	<i>file system security group</i>
UDP	2049	<i>file system security group</i>
UDP	635	<i>file system security group</i>
UDP	4045 - 4046	<i>file system security group</i>
TCP	4049	<i>file system security group</i>
TCP	635	<i>file system security group</i>
TCP	2049	<i>file system security group</i>
TCP	111	<i>file system security group</i>
TCP	4045 - 4046	<i>file system security group</i>
TCP	20001 - 20003	<i>file system security group</i>
All	All	<i>file system security group</i>

The security group that is created and attached to the file system is tagged with Name=fsx-sg-**1**. The value in the tag is automatically incremented each time the launch instance wizard creates a security group for Amazon FSx file systems.

The security group includes the following rules.

Inbound rules

Protocol type	Port number	Source
UDP	2049	<i>instance security group</i>
UDP	20001 - 20003	<i>instance security group</i>
UDP	4049	<i>instance security group</i>
UDP	111	<i>instance security group</i>
UDP	635	<i>instance security group</i>
UDP	4045 - 4046	<i>instance security group</i>
TCP	4045 - 4046	<i>instance security group</i>
TCP	635	<i>instance security group</i>
TCP	2049	<i>instance security group</i>
TCP	4049	<i>instance security group</i>
TCP	20001 - 20003	<i>instance security group</i>
TCP	111	<i>instance security group</i>

Outbound rules

Protocol type	Port number	Destination
All	All	0.0.0.0/0

User data script

If you choose to automatically attach user data scripts, the launch instance wizard adds the following user data to the instance. This script installs the necessary packages, mounts the file system, and updates your instance settings so that the file system will automatically re-mount whenever the instance restarts.

```
#cloud-config
package_update: true
package_upgrade: true
runcmd:
- yum install -y nfs-utils
- apt-get -y install nfs-common
- svm_id_1=svm_id
- file_system_id_1=file_system_id
- vol_path_1=/vol1
- fsx_mount_point_1=/mnt/fsx/fs1
- mkdir -p "${fsx_mount_point_1}"
- if [ -z "$svm_id_1" ]; then printf "\n${file_system_id_1}.fsx.eu-
north-1.amazonaws.com:/${vol_path_1} ${fsx_mount_point_1} nfs4
nfsvers=4.1,rsize=1048576,wsize=1048576,hard,timeo=600,retrans=2,noresvport,_netdev
0 0\n" >> /etc/fstab; else printf "\n${svm_id_1}.${file_system_id_1}.fsx.eu-
north-1.amazonaws.com:/${vol_path_1} ${fsx_mount_point_1} nfs4
nfsvers=4.1,rsize=1048576,wsize=1048576,hard,timeo=600,retrans=2,noresvport,_netdev 0
0\n" >> /etc/fstab; fi
- retryCnt=15; waitTime=30; while true; do mount -a -t nfs4 defaults; if [ $? = 0 ] || [ $retryCnt -lt 1 ]; then echo File system mounted successfully; break; fi; echo File
system not available, retrying to mount.; ((retryCnt--)); sleep $waitTime; done;
```

Mount an Amazon FSx file system at launch

To mount a new or existing Amazon FSx file system at launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and then choose **Launch instance** to open the launch instance wizard.
3. In the **Application and OS Images** section, select the AMI to use.
4. In the **Instance type** section, select the instance type.
5. In the **Key pair** section, select an existing key pair or create a new one.
6. In the **Network settings** section, do the following:
 - a. Choose **Edit**.
 - b. If you want to **mount an existing file system**, for **Subnet**, choose the file system's preferred subnet. We recommend that you launch the instance into the same Availability Zone as the file system's preferred subnet to optimize performance.

If you want to **create a new file system** to mount to an instance, for **Subnet**, choose the subnet into which to launch the instance.

⚠️ Important

You must select a subnet to enable the Amazon FSx functionality in the new launch instance wizard. If you do not select a subnet, you will not be able to mount an existing file system or create a new one.

7. In the **Storage** section, do the following:

- a. Configure the volumes as needed.
- b. Expand the **File systems** section and select **FSx**.
- c. Choose **Add shared file system**.
- d. For **File system**, select the file system to mount.

ℹ️ Note

The list displays all Amazon FSx for NetApp ONTAP and Amazon FSx for OpenZFS file systems in your account in the selected Region.

- e. To automatically create and attach the security groups needed to enable access to the file system, select **Automatically create and attach security groups**. If you prefer to create the security groups manually, clear the check box. For more information, see [Security groups](#).
 - f. To automatically attach the user data scripts needed to mount the file system, select **Automatically mount shared file system by attaching required user data script**. If you prefer to provide the user data scripts manually, clear the check box. For more information, see [User data script](#).
8. In the **Advanced** section, configure the additional instance settings as needed.
9. Choose **Launch**.

Use Amazon File Cache with Amazon EC2

Amazon File Cache is a fully managed, high-speed cache on AWS that's used to process file data, regardless of where the data is stored. Amazon File Cache serves as a temporary, high-performance

storage location for data that's stored in on-premises file systems, AWS file systems, and Amazon Simple Storage Service (Amazon S3) buckets. You can use this capability to make dispersed datasets available to file-based applications on AWS with a unified view, and at high speeds—sub-millisecond latencies and high throughput. For more information, see [What is Amazon File Cache?](#).

You can access your cache from your Amazon EC2 instances using the open-source Lustre client. Amazon EC2 instances can access your cache from other Availability Zones within the same Amazon Virtual Private Cloud (Amazon VPC), provided that your networking allows access across subnets within the VPC. After your cache is mounted, you can work with its files and directories as you do when using a local file system.

To get started, see [Getting started with Amazon File Cache](#).

Instance volume limits

The maximum number of Amazon EBS volumes that you can attach to an instance depends on the instance type and instance size. When considering how many volumes to attach to your instance, you should consider whether you need increased I/O bandwidth or increased storage capacity.

Bandwidth versus capacity

For consistent and predictable bandwidth use cases, use Amazon EBS-optimized instances with General Purpose SSD volumes or Provisioned IOPS SSD volumes. For maximum performance, match the IOPS you have provisioned for your volumes with the bandwidth available for your instance type.

For RAID configurations, you might find that arrays larger than 8 volumes have diminished performance returns due to increased I/O overhead. Test your individual application performance and tune it as required.

Topics

- [Volume limits for instances built on the Nitro System](#)
- [Volume limits for Xen-based instances](#)

Volume limits for instances built on the Nitro System

Topics

- [Dedicated Amazon EBS volume limit](#)
- [Shared Amazon EBS volume limit](#)

Dedicated Amazon EBS volume limit

The following Nitro instance types have a dedicated Amazon EBS volume limit that varies depending on instance size. The limit is not shared with other device attachments. In other words, you can attach any number of Amazon EBS volumes up to the volume attachment limit, regardless of the number of attached devices, such as NVMe instance store volumes and network interfaces.

- General purpose: M7a, M7i, M7i-flex
- Compute optimized: C7a, C7i
- Memory optimized: R7a, R7i, R7iz

For these instance types that support **dedicated volume limits**, the volume limits depend on the instance size. The following table shows the limit for each instance size.

Instance size	Volume limit
medium large xlarge 2xlarge 4xlarge 8xlarge 12xlarge	32
16xlarge	48
24xlarge	64
32xlarge	88
48xlarge	128
metal-16x1 metal-24x1	39
metal-32x1 metal-48x1	79

Shared Amazon EBS volume limit

All other Nitro instance types (not listed in [Dedicated Amazon EBS volume limit](#)) have a volume attachment limit that is shared between Amazon EBS volumes, network interfaces, and NVMe instance store volumes. You can attach any number of Amazon EBS volumes up to that limit, less the number of attached network interfaces and NVMe instance store volumes. Keep in mind that every instance must have at least one network interface, and that NVMe instance store volumes are automatically attached at launch.

Most of these instances support a maximum of 28 attachments. For example, if you have no additional network interface attachments on an m5.xlarge instance, you can attach up to 27 EBS volumes (*28 volume limit - 1 network interface*). If you have two additional network interfaces on an m5.xlarge instance, you can attach up to 25 EBS volumes (*28 volume limit - 3 network interfaces*). Similarly, if you have two additional network interfaces on an m5d.xlarge instance, which has 1 NVMe instance store volume, you can attach up to 24 EBS volumes (*28 volume limit - 3 network interfaces - 1 NVMe instance store volume*).

The following exceptions for instance types that have **shared volume limits**:

- DL2q instances support a maximum of 19 EBS volumes.
- Most bare metal instances support a maximum of 31 EBS volumes.
- High memory virtualized instances support a maximum of 27 EBS volumes.
- High memory bare metal instances support a maximum of 19 EBS volumes.
- mac1.metal instances support a maximum of 16 EBS volumes.
- mac2.metal, mac2-m2.metal, and mac2-m2pro.metal instances support a maximum of 10 EBS volumes.
- inf1.24xlarge instances support a maximum of 11 EBS volumes.
- g5.48xlarge instances support a maximum of 9 EBS volumes.
- d3.8xlarge and d3en.12xlarge instances support a maximum of 3 EBS volumes.
- For accelerated computing instances, the attached accelerators count towards the shared volume limit. For example, for p4d.24xlarge instances, which have a shared volume limit of 28, 8 GPUs, and 8 NVMe instance store volumes, you can attach up to 11 Amazon EBS volumes (*28 volume limit - 1 network interface - 8 GPUs - 8 NVMe instance store volumes*).

Volume limits for Xen-based instances

The following table shows the volume limits for Xen-based Windows instances based on the driver used. That these numbers include the root volume, plus any attached instance store volumes and Amazon EBS volumes.

Important

Attaching more than the following number of volumes to a Xen-based Windows instance is supported on a best effort basis only and is not guaranteed.

Driver	Volume Limit
AWS PV	26
Citrix PV	26
Red Hat PV	17

We recommend that you do not attach more than 26 volumes to a Xen-based Windows instance with AWS PV or Citrix PV drivers, as it is likely to cause performance issues.

To determine which PV drivers your instance is using, or to upgrade your Windows instance from Red Hat to Citrix PV drivers, see [Upgrade PV drivers on Windows instances](#).

For more information about how device names are related to volumes, see [Map disks to volumes on your Windows instance](#).

Amazon EC2 instance root device volume

When you launch an instance, the *root device volume* contains the image used to boot the instance. When you launch a Windows instance, a root EBS volume is created from an EBS snapshot and attached to the instance.

Topics

- [Configure the root volume to persist](#)
- [Confirm that a root volume is configured to persist](#)

- [Change the initial size of the root volume](#)

Configure the root volume to persist

By default, the root volume is deleted when the instance terminates (the `DeleteOnTermination` attribute is `true`). Using the console, you can change `DeleteOnTermination` when you launch an instance. To change this attribute for an existing instance, you must use the command line.

Topics

- [Configure the root volume to persist during instance launch](#)
- [Configure the root volume to persist for an existing instance](#)

Configure the root volume to persist during instance launch

You can configure the root volume to persist when you launch an instance using the Amazon EC2 console or the command line tools.

Console

To configure the root volume to persist when you launch an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and then choose **Launch instances**.
3. On the **Choose an Amazon Machine Image (AMI)** page, select the AMI to use and choose **Select**.
4. Follow the wizard to complete the **Choose an Instance Type** and **Configure Instance Details** pages.
5. On the **Add Storage** page, deselect **Delete On Termination** for the root volume.
6. Complete the remaining wizard pages, and then choose **Launch**.

AWS CLI

To configure the root volume to persist when you launch an instance using the AWS CLI

Use the [run-instances](#) command and include a block device mapping that sets the `DeleteOnTermination` attribute to `false`.

```
C:\> aws ec2 run-instances --block-device-mappings file://mapping.json ...other parameters...
```

Specify the following in mapping.json.

```
[  
  {  
    "DeviceName": "/dev/sda1",  
    "Ebs": {  
      "DeleteOnTermination": false  
    }  
  }  
]
```

Tools for Windows PowerShell

To configure the root volume to persist when you launch an instance using the Tools for Windows PowerShell

Use the [New-EC2Instance](#) command and include a block device mapping that sets the DeleteOnTermination attribute to false.

```
C:\> $ebs = New-Object Amazon.EC2.Model.EbsBlockDevice  
C:\> $ebs.DeleteOnTermination = $false  
C:\> $bdm = New-Object Amazon.EC2.Model.BlockDeviceMapping  
C:\> $bdm.DeviceName = "dev/xvda"  
C:\> $bdm.Ebs = $ebs  
C:\> New-EC2Instance -ImageId ami-0abcdef1234567890 -BlockDeviceMapping  
$bdm ...other parameters...
```

Configure the root volume to persist for an existing instance

You can configure the root volume to persist for a running instance using the command line tools only.

AWS CLI

To configure the root volume to persist for an existing instance using the AWS CLI

Use the [modify-instance-attribute](#) command with a block device mapping that sets the DeleteOnTermination attribute to false.

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --block-device-mappings file://mapping.json
```

Specify the following in mapping.json.

```
[  
  {  
    "DeviceName": "/dev/xvda",  
    "Ebs": {  
      "DeleteOnTermination": false  
    }  
  }  
]
```

Tools for Windows PowerShell

To configure the root volume to persist for an existing instance using the AWS Tools for Windows PowerShell

Use the [Edit-EC2InstanceAttribute](#) command with a block device mapping that sets the DeleteOnTermination attribute to false.

```
C:\> $ebs = New-Object Amazon.EC2.Model.EbsInstanceBlockDeviceSpecification  
C:\> $ebs.DeleteOnTermination = $false  
C:\> $bdm = New-Object Amazon.EC2.Model.InstanceBlockDeviceMappingSpecification  
C:\> $bdm.DeviceName = "/dev/xvda"  
C:\> $bdm.Ebs = $ebs  
C:\> Edit-EC2InstanceAttribute -InstanceId i-1234567890abcdef0 -BlockDeviceMapping  
$bdm
```

Confirm that a root volume is configured to persist

You can confirm that a root volume is configured to persist using the Amazon EC2 console or the command line tools.

Console

To confirm that a root volume is configured to persist using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Instances** and then select the instance.
3. In the **Storage** tab, under **Block devices**, locate the entry for the root volume. If **Delete on termination** is No, the volume is configured to persist.

AWS CLI

To confirm that a root volume is configured to persist using the AWS CLI

Use the [describe-instances](#) command and verify that the DeleteOnTermination attribute in the BlockDeviceMappings response element is set to false.

```
C:\> aws ec2 describe-instances --instance-id i-1234567890abcdef0
```

```
...
"BlockDeviceMappings": [
{
    "DeviceName": "/dev/sda1",
    "Ebs": {
        "Status": "attached",
        "DeleteOnTermination": "false,
        "VolumeId": "vol-1234567890abcdef0",
        "AttachTime": "2013-07-19T02:42:39.000Z"
    }
}
...
...
```

Tools for Windows PowerShell

To confirm that a root volume is configured to persist using the AWS Tools for Windows PowerShell

Use the [Get-EC2Instance](#) and verify that the DeleteOnTermination attribute in the BlockDeviceMappings response element is set to false.

```
C:\> (Get-EC2Instance -InstanceId i-
-1234567890abcdef0).Instances.BlockDeviceMappings.Ebs
```

Change the initial size of the root volume

By default, the size of the root volume is determined by the size of the snapshot. You can increase the initial size of the root volume using the block device mapping of the instance as follows.

1. Determine the device name of the root volume specified in the AMI, as described in [View the EBS volumes in an AMI block device mapping](#).
2. Confirm the size of the snapshot specified in the AMI block device mapping.
3. Override the size of the root volume using the instance block device mapping, as described in [Update the block device mapping when launching an instance](#), specifying a volume size that is larger than the snapshot size.

For example, the following entry for the instance block device mapping increases the size of the root volume, `/dev/xvda`, to 100 GiB. You can omit the snapshot ID in the instance block device mapping because the snapshot ID is already specified in the AMI block device mapping.

```
{  
    "DeviceName": "/dev/xvda",  
    "Ebs": {  
        "VolumeSize": 100  
    }  
}
```

For more information, see [Block device mappings](#).

Device names on Windows instances

When you attach a volume to your instance, you include a device name for the volume. This device name is used by Amazon EC2. The block device driver for the instance assigns the actual volume name when mounting the volume, and the name assigned can be different from the name that Amazon EC2 uses.

The number of volumes that your instance can support is determined by the operating system. For more information, see [Instance volume limits](#).

Contents

- [Available device names](#)
- [Device name considerations](#)

For information about device names on Linux instances, see [Device naming on Linux instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

Available device names

Windows AMIs use one of the following sets of drivers to permit access to virtualized hardware: AWS PV, Citrix PV, and RedHat PV. For more information, see [Paravirtual drivers for Windows instances](#).

The following table lists the available device names that you can specify in a block device mapping or when attaching an EBS volume.

Driver type	Available	Reserved for root volume	Recommended for EBS volumes	Instance store volumes
AWS PV, Citrix PV	xvd[b-z]	/dev/sda1	xvd[f-z] *	xvdc[a-x]
	xvd[b-c][a-z]			xvd[a-e]
	/dev/sda1			**
	/dev/sd[b-e]			
Red Hat PV	xvd[a-z]	/dev/sda1	xvd[f-p]	xvdc[a-x]
	xvd[b-c][a-z]			xvd[a-e]
	/dev/sda1			
	/dev/sd[b-e]			

* For Citrix PV and Red Hat PV, if you map an EBS volume with the name xvda, Windows does not recognize the volume (the volume is visible for AWS PV or AWS NVMe).

** NVMe instance store volumes are automatically enumerated and assigned a Windows drive letter.

For more information about instance store volumes, see [Amazon EC2 instance store](#). For more information about NVMe EBS volumes (Nitro-based instances), including how to identify the EBS device, see [Amazon EBS and NVMe](#) in the *Amazon EBS User Guide*.

Device name considerations

Keep the following in mind when selecting a device name:

- Although you can attach your EBS volumes using the device names used to attach instance store volumes, we strongly recommend that you don't because the behavior can be unpredictable.
- The number of NVMe instance store volumes for an instance depends on the size of the instance. NVMe instance store volumes are automatically enumerated and assigned a Windows drive letter.
- AWS Windows AMIs come with additional software that prepares an instance when it first boots up. This is either the EC2Config service (Windows AMIs prior to Windows Server 2016) or EC2Launch (Windows Server 2016 and later). After the devices have been mapped to drives, they are initialized and mounted. The root drive is initialized and mounted as C:\. By default, when an EBS volume is attached to a Windows instance, it can show up as any drive letter on the instance. You can change the settings to set the drive letters of the volumes per your specifications. For instance store volumes, the default depends on the driver. AWS PV drivers and Citrix PV drivers assign instance store volumes drive letters going from Z: to A:. Red Hat drivers assign instance store volumes drive letters going from D: to Z:. For more information, see [Configure a Windows instance using the EC2Config service \(legacy\)](#), [Configure a Windows instance using EC2Launch](#), and [Map disks to volumes on your Windows instance](#).

Before you specify the device name that you've selected, verify that it is available. Otherwise, you'll get an error that the device name is already in use. For example, on Linux, you can use the **lsblk** command to view the disk devices and their mount points. On Windows you can use the Disk Management utility or the **diskpart** command.

Block device mappings

Each instance that you launch has an associated root device volume, which is either an Amazon EBS volume or an instance store volume. You can use block device mapping to specify additional EBS volumes or instance store volumes to attach to an instance when it's launched. You can also attach additional EBS volumes to a running instance. However, the only way to attach instance store volumes to an instance is to use block device mapping to attach the volumes as the instance is launched.

For more information about root device volumes, see [Amazon EC2 instance root device volume](#).

Contents

- [Block device mapping concepts](#)
- [AMI block device mapping](#)
- [Instance block device mapping](#)

Block device mapping concepts

A *block device* is a storage device that moves data in sequences of bytes or bits (blocks). These devices support random access and generally use buffered I/O. Examples include hard disks, CD-ROM drives, and flash drives. A block device can be physically attached to a computer or accessed remotely as if it were physically attached to the computer.

Amazon EC2 supports two types of block devices:

- Instance store volumes (virtual devices whose underlying hardware is physically attached to the host computer for the instance)
- EBS volumes (remote storage devices)

A *block device mapping* defines the block devices (instance store volumes and EBS volumes) to attach to an instance. You can specify a block device mapping as part of creating an AMI so that the mapping is used by all instances launched from the AMI. Alternatively, you can specify a block device mapping when you launch an instance, so this mapping overrides the one specified in the AMI from which you launched the instance. Note that all NVMe instance store volumes supported by an instance type are automatically enumerated and assigned a device name on instance launch; including them in your block device mapping has no effect.

Contents

- [Block device mapping entries](#)
- [Block device mapping instance store caveats](#)
- [Example block device mapping](#)
- [How devices are made available in the operating system](#)

Block device mapping entries

When you create a block device mapping, you specify the following information for each block device that you need to attach to the instance:

- The device name used within Amazon EC2. The block device driver for the instance assigns the actual volume name when mounting the volume. The name assigned can be different from the name that Amazon EC2 recommends. For more information, see [Device names on Windows instances](#).

For Instance store volumes, you also specify the following information:

- The virtual device: `ephemeral[0-23]`. Note that the number and size of available instance store volumes for your instance varies by instance type.

For NVMe instance store volumes, the following information also applies:

- These volumes are automatically enumerated and assigned a device name; including them in your block device mapping has no effect.

For EBS volumes, you also specify the following information:

- The ID of the snapshot to use to create the block device (`snap-xxxxxxxx`). This value is optional as long as you specify a volume size. You can't specify the ID of an archived snapshot.
- The size of the volume, in GiB. The specified size must be greater than or equal to the size of the specified snapshot.
- Whether to delete the volume on instance termination (true or false). The default value is true for the root device volume and false for attached volumes. When you create an AMI, its block device mapping inherits this setting from the instance. When you launch an instance, it inherits this setting from the AMI.
- The volume type, which can be gp2 and gp3 for General Purpose SSD, io1 and io2 for Provisioned IOPS SSD, st1 for Throughput Optimized HDD, sc1 for Cold HDD, or standard for Magnetic.
- The number of input/output operations per second (IOPS) that the volume supports. (Used only with io1 and io2 volumes.)

Block device mapping instance store caveats

There are several caveats to consider when launching instances with AMIs that have instance store volumes in their block device mappings.

- Some instance types include more instance store volumes than others, and some instance types contain no instance store volumes at all. If your instance type supports one instance store volume, and your AMI has mappings for two instance store volumes, then the instance launches with one instance store volume.
- Instance store volumes can only be mapped at launch time. You cannot stop an instance without instance store volumes (such as the t2.micro), change the instance to a type that supports instance store volumes, and then restart the instance with instance store volumes. However, you can create an AMI from the instance and launch it on an instance type that supports instance store volumes, and map those instance store volumes to the instance.
- If you launch an instance with instance store volumes mapped, and then stop the instance and change it to an instance type with fewer instance store volumes and restart it, the instance store volume mappings from the initial launch still show up in the instance metadata. However, only the maximum number of supported instance store volumes for that instance type are available to the instance.

 **Note**

When an instance is stopped, all data on the instance store volumes is lost.

- Depending on instance store capacity at launch time, M3 instances may ignore AMI instance store block device mappings at launch unless they are specified at launch. You should specify instance store block device mappings at launch time, even if the AMI you are launching has the instance store volumes mapped in the AMI, to ensure that the instance store volumes are available when the instance launches.

Example block device mapping

This figure shows an example block device mapping for an EBS-backed instance. It maps /dev/sdb to ephemeral0 and maps two EBS volumes, one to /dev/sdh and the other to /dev/sdj. It also shows the EBS volume that is the root device volume, /dev/sda1.

Note that this example block device mapping is used in the example commands and APIs in this topic. You can find example commands and APIs that create block device mappings in [Specify a block device mapping for an AMI](#) and [Update the block device mapping when launching an instance](#).

How devices are made available in the operating system

Device names like `/dev/sdh` and `xvdh` are used by Amazon EC2 to describe block devices. The block device mapping is used by Amazon EC2 to specify the block devices to attach to an EC2 instance. After a block device is attached to an instance, it must be mounted by the operating system before you can access the storage device. When a block device is detached from an instance, it is unmounted by the operating system and you can no longer access the storage device.

With a Windows instance, the device names specified in the block device mapping are mapped to their corresponding block devices when the instance first boots, and then the `Ec2Config` service initializes and mounts the drives. The root device volume is mounted as `C:\`. The instance store volumes are mounted as `Z:\`, `Y:\`, and so on. When an EBS volume is mounted, it can be mounted using any available drive letter. However, you can configure how the `Ec2Config` Service assigns drive letters to EBS volumes; for more information, see [Configure a Windows instance using the Ec2Config service \(legacy\)](#).

AMI block device mapping

Each AMI has a block device mapping that specifies the block devices to attach to an instance when it is launched from the AMI. To add more block devices to an AMI, you must create your own AMI.

Contents

- [Specify a block device mapping for an AMI](#)
- [View the EBS volumes in an AMI block device mapping](#)

Specify a block device mapping for an AMI

There are two ways to specify volumes in addition to the root volume when you create an AMI. If you've already attached volumes to a running instance before you create an AMI from the instance, the block device mapping for the AMI includes those same volumes. For EBS volumes, the existing data is saved to a new snapshot, and it's this new snapshot that's specified in the block device mapping. For instance store volumes, the data is not preserved.

For an EBS-backed AMI, you can add EBS volumes and instance store volumes using a block device mapping. For an instance store-backed AMI, you can add instance store volumes only by modifying the block device mapping entries in the image manifest file when registering the image.

 **Note**

For M3 instances, you must specify instance store volumes in the block device mapping for the instance when you launch it. When you launch an M3 instance, instance store volumes specified in the block device mapping for the AMI may be ignored if they are not specified as part of the instance block device mapping.

To add volumes to an AMI using the console

1. Open the Amazon EC2 console.
2. In the navigation pane, choose **Instances**.
3. Select an instance and choose **Actions, Image and templates, Create image**.
4. Enter a name and a description for the image.
5. The instance volumes appear under **Instance volumes**. To add another volume, choose **Add volume**.

6. For **Volume type**, choose the volume type. For **Device** choose the device name. For an EBS volume, you can specify additional details, such as a snapshot, volume size, volume type, IOPS, and encryption state.
7. Choose **Create image**.

To add volumes to an AMI using the command line

Use the [create-image](#) AWS CLI command to specify a block device mapping for an EBS-backed AMI.

Use the [register-image](#) AWS CLI command to specify a block device mapping for an instance store-backed AMI.

Specify the block device mapping using the `--block-device-mappings` parameter. Arguments encoded in JSON can be supplied either directly on the command line or by reference to a file:

```
--block-device-mappings [mapping, ...]  
--block-device-mappings [file://mapping.json]
```

To add an instance store volume, use the following mapping.

```
{  
    "DeviceName": "xvdb",  
    "VirtualName": "ephemeral0"  
}
```

To add an empty 100 GiB gp2 volume, use the following mapping.

```
{  
    "DeviceName": "xvdg",  
    "Ebs": {  
        "VolumeSize": 100  
    }  
}
```

To add an EBS volume based on a snapshot, use the following mapping.

```
{  
    "DeviceName": "xvdh",  
    "Ebs": {  
        "SnapshotId": "snap-xxxxxxxx"  
    }  
}
```

```
    }  
}
```

To omit a mapping for a device, use the following mapping.

```
{  
    "DeviceName": "xvdj",  
    "NoDevice": ""  
}
```

Alternatively, you can use the `-BlockDeviceMapping` parameter with the following commands (AWS Tools for Windows PowerShell):

- [New-EC2Image](#)
- [Register-EC2Image](#)

View the EBS volumes in an AMI block device mapping

You can easily enumerate the EBS volumes in the block device mapping for an AMI.

To view the EBS volumes for an AMI using the console

1. Open the Amazon EC2 console.
2. In the navigation pane, choose **AMIs**.
3. Choose **EBS images** from the **Filter** list to get a list of EBS-backed AMIs.
4. Select the desired AMI, and look at the **Details** tab. At a minimum, the following information is available for the root device:
 - **Root Device Type (ebs)**
 - **Root Device Name** (for example, `/dev/sda1`)
 - **Block Devices** (for example, `/dev/sda1=snap-1234567890abcdef0:8:true`)

If the AMI was created with additional EBS volumes using a block device mapping, the **Block Devices** field displays the mapping for those additional volumes as well. (This screen doesn't display instance store volumes.)

To view the EBS volumes for an AMI using the command line

Use the [describe-images \(AWS CLI\)](#) command or [Get-EC2Image \(AWS Tools for Windows PowerShell\)](#) command to enumerate the EBS volumes in the block device mapping for an AMI.

Instance block device mapping

By default, an instance that you launch includes any storage devices specified in the block device mapping of the AMI from which you launched the instance. You can specify changes to the block device mapping for an instance when you launch it, and these updates overwrite or merge with the block device mapping of the AMI.

Limitations

- For the root volume, you can only modify the following: volume size, volume type, and the **Delete on Termination** flag.
- When you modify an EBS volume, you can't decrease its size. Therefore, you must specify a snapshot whose size is equal to or greater than the size of the snapshot specified in the block device mapping of the AMI.

Contents

- [Update the block device mapping when launching an instance](#)
- [Update the block device mapping of a running instance](#)
- [View the EBS volumes in an instance block device mapping](#)
- [View the instance block device mapping for instance store volumes](#)

Update the block device mapping when launching an instance

You can add EBS volumes and instance store volumes to an instance when you launch it. Note that updating the block device mapping for an instance doesn't make a permanent change to the block device mapping of the AMI from which it was launched.

To add volumes to an instance using the console

1. Open the Amazon EC2 console.
2. From the dashboard, choose **Launch Instance**.
3. On the **Choose an Amazon Machine Image (AMI)** page, select the AMI to use and choose **Select**.

4. Follow the wizard to complete the **Choose an Instance Type** and **Configure Instance Details** pages.
5. On the **Add Storage** page, you can modify the root volume, EBS volumes, and instance store volumes as follows:
 - To change the size of the root volume, locate the **Root** volume under the **Type** column, and change its **Size** field.
 - To suppress an EBS volume specified by the block device mapping of the AMI used to launch the instance, locate the volume and click its **Delete** icon.
 - To add an EBS volume, choose **Add New Volume**, choose **EBS** from the **Type** list, and fill in the fields (**Device**, **Snapshot**, and so on).
 - To suppress an instance store volume specified by the block device mapping of the AMI used to launch the instance, locate the volume, and choose its **Delete** icon.
 - To add an instance store volume, choose **Add New Volume**, select **Instance Store** from the **Type** list, and select a device name from **Device**.
6. Complete the remaining wizard pages, and choose **Launch**.

To add volumes to an instance using the AWS CLI

Use the [run-instances](#) AWS CLI command with the `--block-device-mappings` option to specify a block device mapping for an instance at launch.

For example, suppose that an EBS-backed AMI specifies the following block device mapping:

- `xvdb=ephemeral0`
- `xvdh=snap-1234567890abcdef0`
- `xvdj=:100`

To prevent `xvdj` from attaching to an instance launched from this AMI, use the following mapping.

```
{  
    "DeviceName": "xvdj",  
    "NoDevice": ""  
}
```

To increase the size of xvdh to 300 GiB, specify the following mapping. Notice that you don't need to specify the snapshot ID for xvdh, because specifying the device name is enough to identify the volume.

```
{  
    "DeviceName": "xvdh",  
    "Ebs": {  
        "VolumeSize": 300  
    }  
}
```

To increase the size of the root volume at instance launch, first call [describe-images](#) with the ID of the AMI to verify the device name of the root volume. For example, "RootDeviceName": "/dev/xvda". To override the size of the root volume, specify the device name of the root device used by the AMI and the new volume size.

```
{  
    "DeviceName": "/dev/xvda",  
    "Ebs": {  
        "VolumeSize": 100  
    }  
}
```

To attach an additional instance store volume, xvdc, specify the following mapping. If the instance type doesn't support multiple instance store volumes, this mapping has no effect. If the instance supports NVMe instance store volumes, they are automatically enumerated and assigned an NVMe device name.

```
{  
    "DeviceName": "xvdc",  
    "VirtualName": "ephemeral1"  
}
```

To add volumes to an instance using the AWS Tools for Windows PowerShell

Use the `-BlockDeviceMapping` parameter with the [New-EC2Instance](#) command (AWS Tools for Windows PowerShell).

Update the block device mapping of a running instance

You can use the [modify-instance-attribute](#) AWS CLI command to update the block device mapping of a running instance. You do not need to stop the instance before changing this attribute.

```
aws ec2 modify-instance-attribute --instance-id i-1a2b3c4d --block-device-mappings  
file://mapping.json
```

For example, to preserve the root volume at instance termination, specify the following in `mapping.json`.

```
[  
 {  
   "DeviceName": "/dev/sda1",  
   "Ebs": {  
     "DeleteOnTermination": false  
   }  
 }  
]
```

Alternatively, you can use the `-BlockDeviceMapping` parameter with the [Edit-EC2InstanceAttribute](#) command (AWS Tools for Windows PowerShell).

View the EBS volumes in an instance block device mapping

You can easily enumerate the EBS volumes mapped to an instance.

Note

For instances launched before the release of the 2009-10-31 API, AWS can't display the block device mapping. You must detach and reattach the volumes so that AWS can display the block device mapping.

To view the EBS volumes for an instance using the console

1. Open the Amazon EC2 console.
2. In the navigation pane, choose **Instances**.
3. In the search box, enter **Root device type**, and then choose **EBS**. This displays a list of EBS-backed instances.

4. Select the desired instance and look at the details displayed in the **Storage** tab. At a minimum, the following information is available for the root device:
 - **Root device type** (for example, **EBS**)
 - **Root device name** (for example, `/dev/xvda`)
 - **Block devices** (for example, `/dev/xvda`, `xvdf`, and `xvdj`)

If the instance was launched with additional EBS volumes using a block device mapping, they appear under **Block devices**. Any instance store volumes do not appear on this tab.

5. To display additional information about an EBS volume, choose its volume ID to go to the volume page.

To view the EBS volumes for an instance using the command line

Use the [describe-instances](#) (AWS CLI) command or [Get-EC2Instance](#) (AWS Tools for Windows PowerShell) command to enumerate the EBS volumes in the block device mapping for an instance.

View the instance block device mapping for instance store volumes

When you view the block device mapping for your instance, you can see only the EBS volumes, not the instance store volumes. The method you use to view the instance store volumes for your instance depends on the volume type.

NVMe instance store volumes

You can use Disk Management or PowerShell to list both EBS and instance store NVMe volumes. For more information, see [the section called “List NVMe volumes”](#).

HDD or SSD instance store volumes

You can use instance metadata to query the HDD or SSD instance store volumes in the block device mapping. NVMe instance store volumes are not included.

The base URI for all requests for instance metadata is `http://169.254.169.254/latest/`. For more information, see [Instance metadata and user data](#).

First, connect to your running instance. From the instance, use this query to get its block device mapping.

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/block-device-mapping/
```

The response includes the names of the block devices for the instance. For example, the output for an instance store-backed m1.small instance looks like this.

```
ami  
ephemeral0  
root  
swap
```

The `ami` device is the root device as seen by the instance. The instance store volumes are named `ephemeral[0-23]`. The `swap` device is for the page file. If you've also mapped EBS volumes, they appear as `ebs1`, `ebs2`, and so on.

To get details about an individual block device in the block device mapping, append its name to the previous query, as shown here.

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/block-device-mapping/ephemeral0
```

The instance type determines the number of instance store volumes that are available to the instance. If the number of instance store volumes in a block device mapping exceeds the number of instance store volumes available to an instance, the additional volumes are ignored. To view the instance store volumes for your instance, open Windows Disk Management. To learn how many instance store volumes are supported by each instance type, see [Instance store volumes](#).

Map disks to volumes on your Windows instance

Your Windows instance comes with an EBS volume that serves as the root volume. If your Windows instance uses AWS PV or Citrix PV drivers, you can optionally add up to 25 volumes, making a total of 26 volumes. For more information, see [Instance volume limits](#).

Depending on the instance type of your instance, you'll have from 0 to 24 possible instance store volumes available to the instance. To use any of the instance store volumes that are available to your instance, you must specify them when you create your AMI or launch your instance. You can also add EBS volumes when you create your AMI or launch your instance, or attach them while your instance is running.

When you add a volume to your instance, you specify the device name that Amazon EC2 uses. For more information, see [Device names on Windows instances](#). AWS Windows Amazon Machine Images (AMIs) contain a set of drivers that are used by Amazon EC2 to map instance store and EBS volumes to Windows disks and drive letters. If you launch an instance from a Windows AMI that uses AWS PV or Citrix PV drivers, you can use the relationships described on this page to map your Windows disks to your instance store and EBS volumes. If your Windows AMI uses Red Hat PV drivers, you can update your instance to use the Citrix drivers. For more information, see [Upgrade PV drivers on Windows instances](#).

Contents

List NVMe volumes

You can find the disks on your Windows instance using Disk Management or Powershell.

List NVMe disks using Disk Management

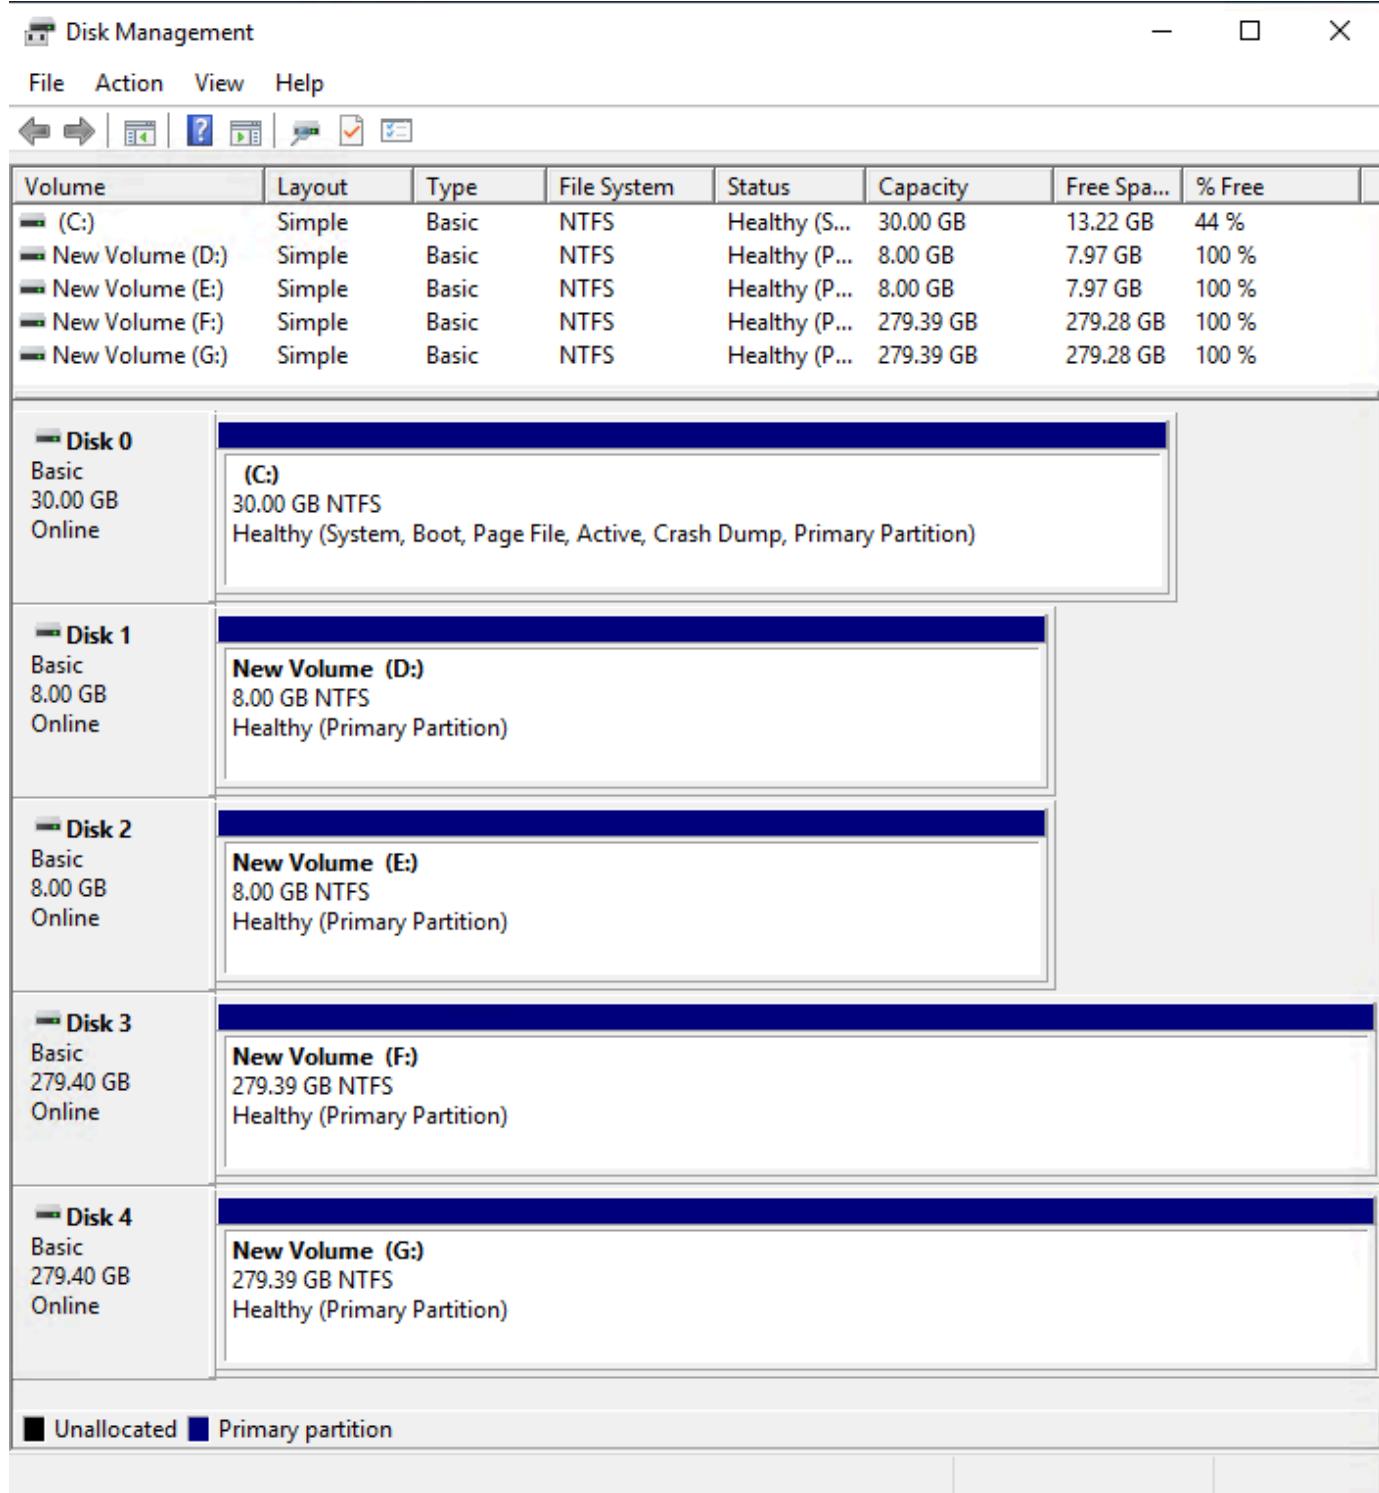

You can find the disks on your Windows instance using Disk Management.

To find the disks on your Windows instance

1. Log in to your Windows instance using Remote Desktop. For more information, see [Connect to your Windows instance](#).
2. Start the Disk Management utility.

3. Review the disks. The root volume is an EBS volume mounted as C:\. If there are no other disks shown, then you didn't specify additional volumes when you created the AMI or launched the instance.

The following is an example that shows the disks that are available if you launch an `r5d.4xlarge` instance with two additional EBS volumes.

List NVMe disks using PowerShell

The following PowerShell script lists each disk and its corresponding device name and volume. It is intended for use with [instances built on the AWS Nitro System](#), which use NVMe EBS and instance store volumes.

Connect to your Windows instance and run the following command to enable PowerShell script execution.

```
Set-ExecutionPolicy RemoteSigned
```

Copy the following script and save it as `mapping.ps1` on your Windows instance.

```
# List the disks for NVMe volumes

function Get-EC2InstanceMetadata {
    param([string]$Path)
    (Invoke-WebRequest -Uri "http://169.254.169.254/latest/$Path").Content
}

function GetEBSVolumeId {
    param($Path)
    $SerialNumber = (Get-Disk -Path $Path).SerialNumber
    if($SerialNumber -clike 'vol*'){
        $EbsVolumeId = $SerialNumber.Substring(0,20).Replace("vol","vol-")
    }
    else {
        $EbsVolumeId = $SerialNumber.Substring(0,20).Replace("AWS","AWS-")
    }
    return $EbsVolumeId
}

function GetDeviceName{
    param($EbsVolumeId)
    if($EbsVolumeId -clike 'vol*'){

        $Device  = ((Get-EC2Volume -VolumeId $EbsVolumeId ).Attachment).Device
        $VolumeName = ""
    }
    else {
        $Device = "Ephemeral"
        $VolumeName = "Temporary Storage"
    }
}
```

```
        Return $Device,$VolumeName
    }

function GetDriveLetter{
    param($Path)
    $DiskNumber = (Get-Disk -Path $Path).Number
    if($DiskNumber -eq 0){
        $VirtualDevice = "root"
        $DriveLetter = "C"
        $PartitionNumber = (Get-Partition -DriveLetter C).PartitionNumber
    }
    else
    {
        $VirtualDevice = "N/A"
        $DriveLetter = (Get-Partition -DiskNumber $DiskNumber).DriveLetter
        if(!$DriveLetter)
        {
            $DriveLetter = ((Get-Partition -DiskId $Path).AccessPaths).Split(",")[0]
        }
        $PartitionNumber = (Get-Partition -DiskId $Path).PartitionNumber
    }

    return $DriveLetter,$VirtualDevice,$PartitionNumber
}

$Report = @()
foreach($Path in (Get-Disk).Path)
{
    $Disk_ID = (Get-Partition -DiskId $Path).DiskId
    $Disk = (Get-Disk -Path $Path).Number
    $EbsVolumeId = GetEBSVolumeId($Path)
    $Size =(Get-Disk -Path $Path).Size
    $DriveLetter,$VirtualDevice, $Partition = (GetDriveLetter($Path))
    $Device,$VolumeName = GetDeviceName($EbsVolumeId)
    $Disk = New-Object PSObject -Property @{
        Disk          = $Disk
        Partitions    = $Partition
        DriveLetter   = $DriveLetter
        EbsVolumeId   = $EbsVolumeId
        Device        = $Device
        VirtualDevice = $VirtualDevice
        VolumeName    = $VolumeName
    }
}
```

```
$Report += $Disk
}

$Report | Sort-Object Disk | Format-Table -AutoSize -Property Disk, Partitions,
DriveLetter, EbsVolumeId, Device, VirtualDevice, VolumeName
```

Run the script as follows:

```
PS C:\> .\mapping.ps1
```

The following is example output for an instance with a root volume, two EBS volumes, and two instance store volumes.

Disk	Partitions	DriveLetter	EbsVolumeId	Device	VirtualDevice	VolumeName
0	1	C	vol-03683f1d861744bc7	/dev/sda1	root	
1	1	D	vol-082b07051043174b9	xvdb	N/A	
2	1	E	vol-0a4064b39e5f534a2	xvdc	N/A	
3	1	F	AWS-6AAD8C2AEEE1193F0	Ephemeral	N/A	Temporary Storage
4	1	G	AWS-13E7299C2BD031A28	Ephemeral	N/A	Temporary Storage

If you did not configure your credentials for Tools for Windows PowerShell on the Windows instance, the script cannot get the EBS volume ID and uses N/A in the EbsVolumeId column.

Map NVMe EBS volumes

With [instances built on the AWS Nitro System](#), EBS volumes are exposed as NVMe devices. You can use the [Get-Disk](#) command to map Windows disk numbers to EBS volume IDs.

```
PS C:\> Get-Disk
Number Friendly Name Serial Number          HealthStatus
OperationalStatus      Total Size Partition

Style
-----
-----
3   NVMe Amazo... AWS6AAD8C2AEEE1193F0_00000001.  Healthy      Online
    279.4 GB MBR
4   NVMe Amazo... AWS13E7299C2BD031A28_00000001.  Healthy      Online
    279.4 GB MBR
```

2	NVMe Amazo... vol0a4064b39e5f534a2_00000001.	Healthy	Online
	8 GB MBR		
0	NVMe Amazo... vol03683f1d861744bc7_00000001.	Healthy	Online
	30 GB MBR		
1	NVMe Amazo... vol082b07051043174b9_00000001.	Healthy	Online
	8 GB MBR		

You can also run the **ebsnvme-id** command to map NVMe disk numbers to EBS volume IDs and device names.

```
PS C:\> C:\PROGRAMDATA\Amazon\Tools\ebsnvme-id.exe
Disk Number: 0
Volume ID: vol-03683f1d861744bc7
Device Name: sda1

Disk Number: 1
Volume ID: vol-082b07051043174b9
Device Name: xvdb

Disk Number: 2
Volume ID: vol-0a4064b39e5f534a2
Device Name: xvdc
```

List volumes

You can find the disks on your Windows instance using Disk Management or Powershell.

List disks using Disk Management

You can find the disks on your Windows instance using Disk Management.

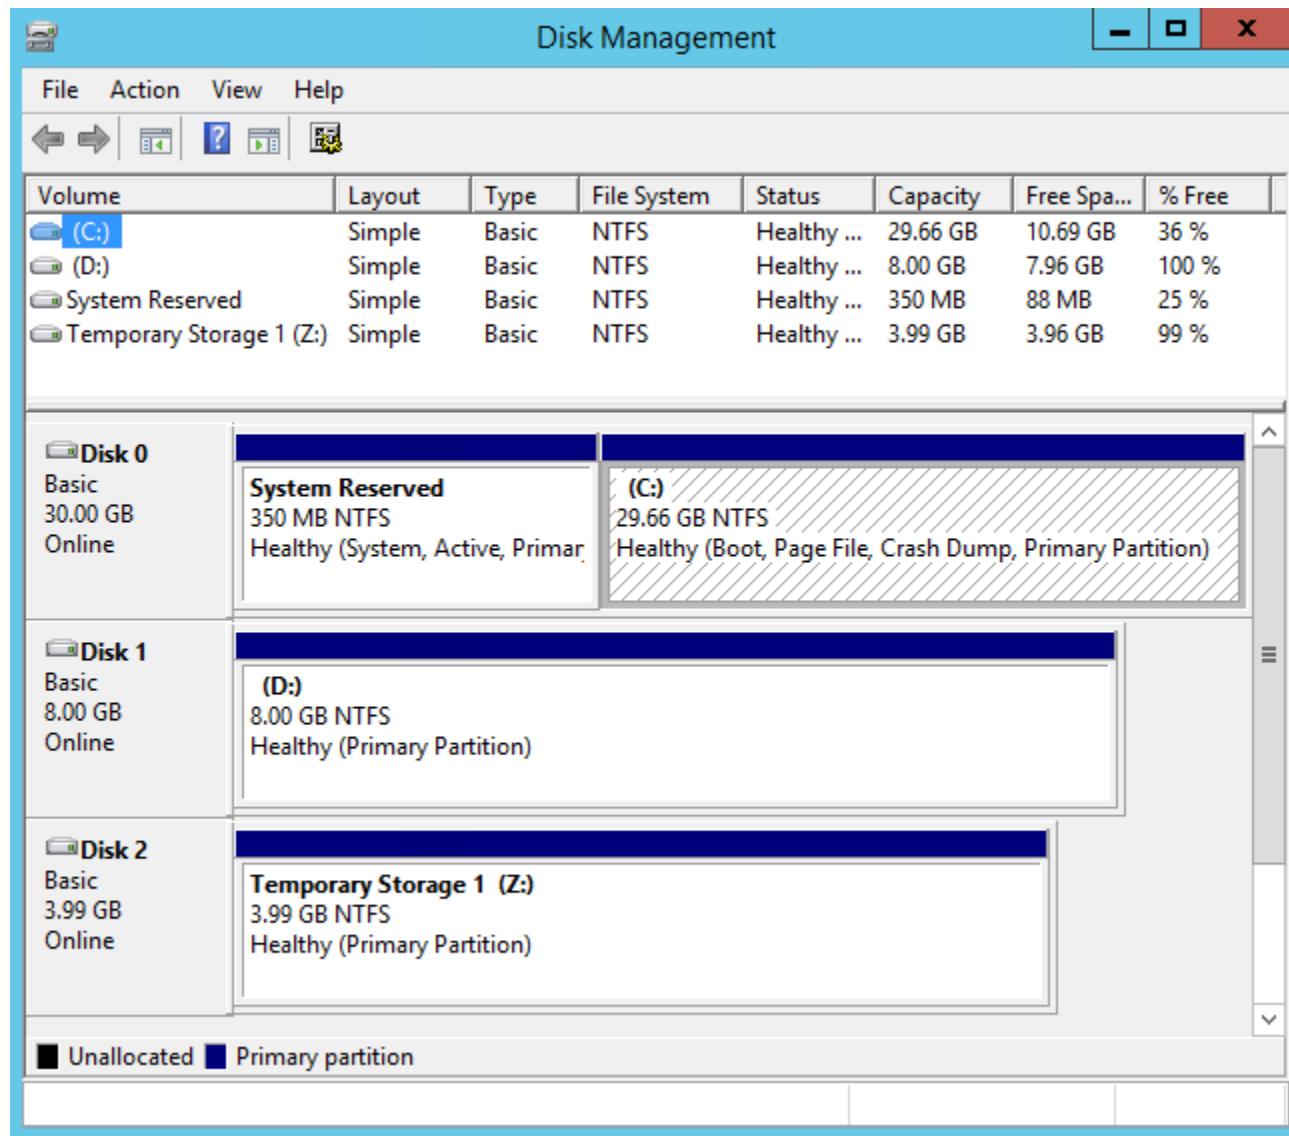

To find the disks on your Windows instance

1. Log in to your Windows instance using Remote Desktop. For more information, see [Connect to your Windows instance](#).
2. Start the Disk Management utility.

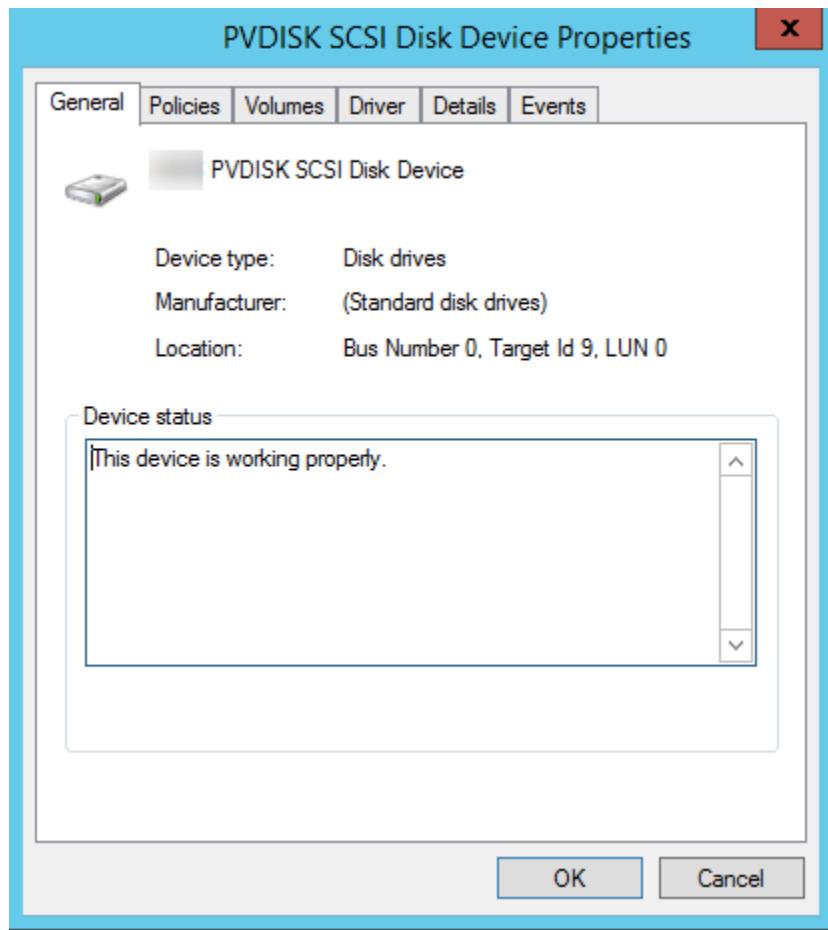

On Windows Server 2012 and later, on the taskbar, right-click the Windows logo, and then choose **Disk Management**. On Windows Server 2008, choose **Start, Administrative Tools, Computer Management, Disk Management**.

- Review the disks. The root volume is an EBS volume mounted as C:\. If there are no other disks shown, then you didn't specify additional volumes when you created the AMI or launched the instance.

The following is an example that shows the disks that are available if you launch an m3.medium instance with an instance store volume (Disk 2) and an additional EBS volume (Disk 1).

- Right-click the gray pane labeled Disk 1, and then select **Properties**. Note the value of **Location** and look it up in the tables in [Map disk devices to device names](#). For example, the following disk has the location Bus Number 0, Target Id 9, LUN 0. According to the table for EBS volumes, the device name for this location is xvdfj.

Map disk devices to device names

The block device driver for the instance assigns the actual volume names when mounting volumes.

Mappings

- [Instance store volumes](#)
- [EBS volumes](#)

Instance store volumes

The following table describes how the Citrix PV and AWS PV drivers map non-NVMe instance store volumes to Windows volumes. The number of available instance store volumes is determined by the instance type. For more information, see [Instance store volumes](#).

Location	Device name
Bus Number 0, Target ID 78, LUN 0	xvdca
Bus Number 0, Target ID 79, LUN 0	xvdcb
Bus Number 0, Target ID 80, LUN 0	xvdcc
Bus Number 0, Target ID 81, LUN 0	xvdcd
Bus Number 0, Target ID 82, LUN 0	xvdce
Bus Number 0, Target ID 83, LUN 0	xvdcf
Bus Number 0, Target ID 84, LUN 0	xvdcg
Bus Number 0, Target ID 85, LUN 0	xvdch
Bus Number 0, Target ID 86, LUN 0	xvdci
Bus Number 0, Target ID 87, LUN 0	xvdcj
Bus Number 0, Target ID 88, LUN 0	xvdck
Bus Number 0, Target ID 89, LUN 0	xvdcl

EBS volumes

The following table describes how the Citrix PV and AWS PV drivers map non-NVME EBS volumes to Windows volumes.

Location	Device name
Bus Number 0, Target ID 0, LUN 0	/dev/sda1
Bus Number 0, Target ID 1, LUN 0	xvdb
Bus Number 0, Target ID 2, LUN 0	xvdc
Bus Number 0, Target ID 3, LUN 0	xvdd

Location	Device name
Bus Number 0, Target ID 4, LUN 0	xvde
Bus Number 0, Target ID 5, LUN 0	xvdf
Bus Number 0, Target ID 6, LUN 0	xvdg
Bus Number 0, Target ID 7, LUN 0	xvdh
Bus Number 0, Target ID 8, LUN 0	xvdi
Bus Number 0, Target ID 9, LUN 0	xvdj
Bus Number 0, Target ID 10, LUN 0	xvdk
Bus Number 0, Target ID 11, LUN 0	xndl
Bus Number 0, Target ID 12, LUN 0	xvdm
Bus Number 0, Target ID 13, LUN 0	xvdn
Bus Number 0, Target ID 14, LUN 0	xvdo
Bus Number 0, Target ID 15, LUN 0	xvdp
Bus Number 0, Target ID 16, LUN 0	xvdq
Bus Number 0, Target ID 17, LUN 0	xvdr
Bus Number 0, Target ID 18, LUN 0	xvds
Bus Number 0, Target ID 19, LUN 0	xvdt
Bus Number 0, Target ID 20, LUN 0	xvdu
Bus Number 0, Target ID 21, LUN 0	xvdv
Bus Number 0, Target ID 22, LUN 0	xvdw
Bus Number 0, Target ID 23, LUN 0	xvdx

Location	Device name
Bus Number 0, Target ID 24, LUN 0	xvdy
Bus Number 0, Target ID 25, LUN 0	xvdz

List disks using PowerShell

The following PowerShell script lists each disk and its corresponding device name and volume.

Requirements and limitations

- Requires Windows Server 2012 or later.
- Requires credentials to get the EBS volume ID. You can configure a profile using the Tools for PowerShell, or attach an IAM role to the instance.
- Does not support NVMe volumes.
- Does not support dynamic disks.

Connect to your Windows instance and run the following command to enable PowerShell script execution.

```
Set-ExecutionPolicy RemoteSigned
```

Copy the following script and save it as mapping.ps1 on your Windows instance.

```
# List the disks
function Convert-SCSITargetIdToDeviceName {
    param([int]$SCSITargetId)
    If ($SCSITargetId -eq 0) {
        return "sda1"
    }
    $deviceName = "xvd"
    If ($SCSITargetId -gt 25) {
        $deviceName += [char](0x60 + [int]($SCSITargetId / 26))
    }
    $deviceName += [char](0x61 + $SCSITargetId % 26)
    return $deviceName
}
```

```

        $i = 0
        While ($i -ne ($array3.Count)) {
            if ($array[2][$i] -eq $EbsVolumeID) {
                $DriveLetter = $array[0][$i]
                $DeviceName = $array[3][$i]
            }
            $i ++
        }
    }
}

$EbsVolumeID = "FSxN Volume"
$BlockDevice = ""

$BlockDeviceName = ($BlockDeviceMappings | Where-Object { $_.ebs.VolumeId -eq $EbsVolumeID }).DeviceName

}

Else {
    $BlockDeviceName = $null
    $BlockDevice = $null
}

New-Object PSObject -Property @{
    Disk          = $Disk;
    Partitions    = $Partitions;
    DriveLetter   = If ($DriveLetter -eq $null) { "N/A" } Else { $DriveLetter };
    EbsVolumeId   = If ($EbsVolumeID -eq $null) { "N/A" } Else { $EbsVolumeID };
    Device        = If ($BlockDeviceName -eq $null) { "N/A" } Else
{ $BlockDeviceName };
    VirtualDevice = If ($VirtualDevice -eq $null) { "N/A" } Else { $VirtualDevice };
    VolumeName    = If ($VolumeName -eq $null) { "N/A" } Else { $VolumeName };
    DeviceName    = If ($DeviceName -eq $null) { "N/A" } Else { $DeviceName };
}
} | Sort-Object Disk | Format-Table -AutoSize -Property Disk, Partitions, DriveLetter,
EbsVolumeId, Device, VirtualDevice, DeviceName, VolumeName
```

Run the script as follows:

```
PS C:\> .\mapping.ps1
```

The following is example output.

Disk	Partitions	DriveLetter	EbsVolumeId	Device	VirtualDevice
DeviceName		VolumeName			
				-----	-----
0	1	C	vol-0561f1783298efedd	/dev/sda1	N/A
NVMe	Amazon	Elastic	B	N/A	
1	1	D	vol-002a9488504c5e35a	xvdb	N/A
NVMe	Amazon	Elastic	B	N/A	
2	1	E	vol-0de9d46fcc907925d	xvdc	N/A
NVMe	Amazon	Elastic	B	N/A	

If you did not provide your credentials on the Windows instance, the script cannot get the EBS volume ID and uses N/A in the EbsVolumeId column.

Application-consistent snapshots based on Windows VSS

You can take application-consistent snapshots of all Amazon EBS volumes attached to your Windows on Amazon EC2 instances using [AWS Systems Manager Run Command](#). The snapshot process uses the Windows [Volume Shadow Copy Service \(VSS\)](#) to take EBS volume level backups of VSS-aware applications. The snapshots include data from pending transactions between these applications and the disk. You don't have to shut down your instances or disconnect them when you need to back up all attached volumes.

There is no additional cost to use VSS-enabled EBS snapshots. You only pay for EBS snapshots created by the backup process. For more information, see [How is my EBS snapshot bill calculated?](#)

Contents

- [What is AWS VSS?](#)
- [Prerequisites](#)
- [Create VSS-enabled EBS snapshots](#)
- [Troubleshooting](#)
- [Restore EBS volumes from VSS-enabled EBS snapshots](#)
- [AWS VSS solution version history](#)

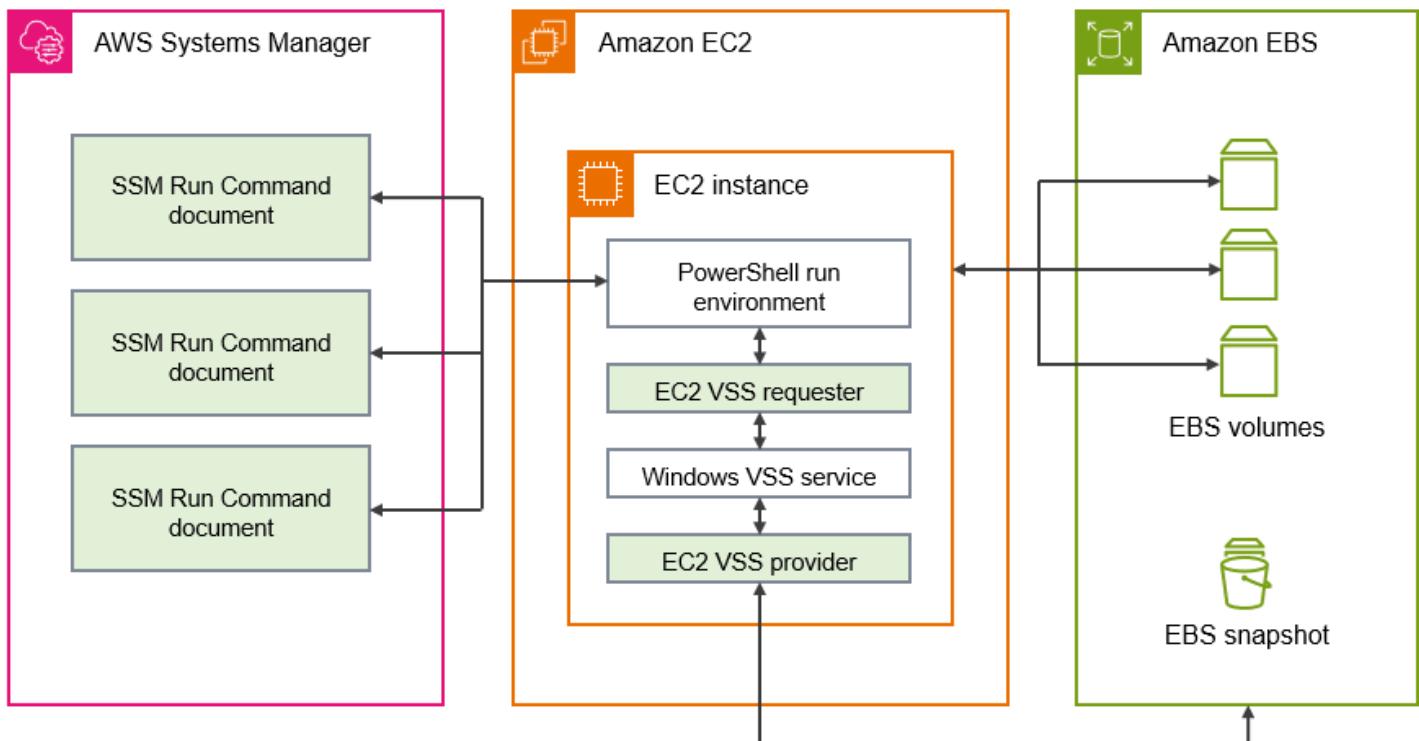

What is AWS VSS?

Volume Snapshot Copy Service (VSS) is a backup and recovery technology included in Microsoft Windows. It can create backup copies, or snapshots, of computer files or volumes while they are in use. For more information, see [Volume Shadow Copy Service](#).

To create an application-consistent snapshot, the following software components are involved.

- *VSS service* — Part of the Windows operating system
- *VSS requester* — The software that requests the creation of shadow copies
- *VSS writer* — Typically provided as part of an application, such as SQL Server, to ensure a consistent data set to back up
- *VSS provider* — The component that creates the shadow copies of the underlying volumes

The AWS VSS solution comprises of multiple Systems Manager (SSM) Run Command documents that facilitate backup creation, and a [Systems Manager Distributor package](#), called AwsVssComponents, that includes an *EC2 VSS requester* and an *EC2 VSS provider*. The AwsVssComponents package must be installed on EC2 Windows instances to take application-consistent snapshots of EBS volumes. The following diagram illustrates the relationship between these software components.

How the AWS VSS solution works

The process for taking application-consistent, VSS-enabled EBS snapshots consists of the following steps.

1. Complete the [Prerequisites](#).
2. Enter parameters for the AWSEC2-VssInstallAndSnapshot SSM document and run this document by using Run Command. For more information, see [Run the AWSEC2-VssInstallAndSnapshot command document \(recommended\)](#).
3. The Windows VSS service on your instance coordinates all ongoing I/O operations for running applications.
4. The system flushes all I/O buffers and temporarily pauses all I/O operations. The pause lasts, at most, ten seconds.
5. During the pause, the system creates snapshots of all volumes attached to the instance.
6. The pause is lifted and I/O resumes operation.
7. The system adds all newly-created snapshots to the list of EBS snapshots. The system tags all VSS-enabled EBS snapshots successfully created by this process with **AppConsistent:true**.
8. If you need to restore from a snapshot, you can use the standard EBS process of creating a volume from a snapshot, or you can restore all volumes to an instance by using a sample script, as described in [Restore EBS volumes from VSS-enabled EBS snapshots](#).

Prerequisites

You can create VSS snapshots with Systems Manager Run Command, AWS Backup, or Amazon Data Lifecycle Manager. The following prerequisites apply for all solutions.

Prerequisites

- [System requirements](#)
- [IAM permissions](#)
- [VSS components](#)

System requirements

Install the SSM Agent

VSS is orchestrated by the AWS Systems Manager (Systems Manager) using PowerShell. Ensure that you have installed SSM Agent version 3.0.502.0 or later on your EC2 instance. If you are already using an older version of the SSM Agent, update it using Run Command. For more information, see [Setting up Systems Manager for Amazon EC2 instances](#) and [Working with SSM Agent on Amazon EC2 instances for Windows Server](#) in the *AWS Systems Manager User Guide*.

Amazon EC2 Windows instance requirements

VSS-enabled EBS snapshots are supported for instances running Windows Server 2012 and later. For older versions of Windows, see Windows version support table in [AWS VSS solution version history](#).

.NET Framework version

The AwsVssComponents package requires .NET Framework version 4.6 or later. If you are using Windows 2012 or 2012 R2, the default .NET Framework version is earlier than 4.6 and you must install version 4.6 or later using Windows Update.

AWS Tools for Windows PowerShell version

Ensure that your instance is running AWS Tools for Windows PowerShell version 3.3.48.0 or later. To check your version, run the following command in the PowerShell terminal on the instance.

```
C:\> Get-AWSPowerShellVersion
```

If you need to update AWS Tools for Windows PowerShell on your instance, see [Installing the AWS Tools for Windows PowerShell](#) in the *AWS Tools for Windows PowerShell User Guide*.

Windows PowerShell version

Ensure that your instance is running Windows PowerShell major version 3, 4, or 5. To check your version, run the following command in a PowerShell terminal on the instance.

```
C:\> $PSVersionTable.PSVersion
```

PowerShell language mode

Ensure that your instance has the PowerShell language mode set to FullLanguage. For more information, see [about_Language_Modes](#) in the Microsoft documentation.

IAM permissions

The IAM role that's attached to your Amazon EC2 Windows instance must have permission to create application-consistent snapshots with VSS. To grant the necessary permissions, you can attach the AWSEC2VssSnapshotPolicy policy to your instance profile.

The policy enables Systems Manager to perform the following actions:

- Create and tag EBS snapshots
- Create and tag Amazon Machine Images (AMIs)
- Attach metadata, such as the device ID, to the default snapshot tags that VSS creates.

Topics

- [Attach the VSS-enabled snapshot policy to your instance profile](#)
- [Managed policy to create VSS snapshots](#)
- [Legacy policy \(no longer supported\)](#)

Attach the VSS-enabled snapshot policy to your instance profile

To grant permissions for VSS-enabled snapshots for your instance, you attach the AWSEC2VssSnapshotPolicy managed policy to your instance profile role as follows. It's important to ensure that your instance meets all [System requirements](#).

Note

To use the managed policy, your instance must have the AwsVssComponents package version 2.3.1 or later installed. For version history, see [AwsVssComponents package versions](#).

If you have a prior version of the AwsVssComponents package installed on your instance, see [Legacy policy](#).

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles** to see a list of IAM roles that you have access to.
3. Select the **Role name** link for the role that's attached to your instance. This opens the role detail page.
4. To attach the managed policy, choose **Add permissions**, located in the upper right corner of the list panel. Then select **Attach policies** from the dropdown list.
5. To streamline results, enter the policy name in the search bar (AWSEC2VssSnapshotPolicy).
6. Select the checkbox next to the name of the policy to attach, and choose **Add permissions**.

Managed policy to create VSS snapshots

An AWS managed policy is a standalone policy that Amazon provides for AWS customers. AWS managed policies are designed to grant permissions for common use cases. You can't change the permissions that are defined in AWS managed policies. However, you can copy the policy and use it as a baseline for a [customer managed policy](#) that is specific to your use case.

For more information about AWS managed policies, see [AWS managed policies](#) in the *IAM User Guide*.

To use the **AWSEC2VssSnapshotPolicy** policy, managed policy, you can attach it to the IAM role that's attached to your EC2 Windows Instances. This policy enables the EC2 VSS solution to create and add tags to Amazon Machine Images (AMIs) and EBS Snapshots. To attach the policy, see [Attach the VSS-enabled snapshot policy to your instance profile](#).

Permissions granted by AWSEC2VssSnapshotPolicy

The **AWSEC2VssSnapshotPolicy** policy includes the following Amazon EC2 permissions:

- **ec2:CreateTags** – Add tags to EBS snapshots and AMIs to help identify and categorize the resources.
- **ec2:DescribeInstanceAttribute** – Retrieve the EBS volumes and corresponding block device mappings that are attached to the target instance.
- **ec2>CreateSnapshots** – Create snapshots of EBS volumes.
- **ec2:CreateImage** – Create an AMI from a running EC2 instance.
- **ec2:DescribeImages** – Retrieve the information for EC2 AMIs and snapshots.
- **ec2:DescribeSnapshots** – Determine the create time and status of snapshots to verify application consistency.

Policy example

The following is an example of the AWSEC2VssSnapshotPolicy policy.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "DescribeInstanceInfo",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeInstanceAttribute"  
            ],  
            "Resource": [  
                "arn:aws:ec2:*::instance/*"  
            ],  
            "Condition": {  
                "StringLike": {  
                    "ec2:SourceInstanceARN": "*${ec2:InstanceId}"  
                }  
            }  
        },  
        {  
            "Sid": "CreateSnapshotsWithTag",  
            "Effect": "Allow",  
            "Action": [  
                "ec2>CreateSnapshots"  
            ],  
            "Resource": [  
                "arn:aws:ec2:*::snapshot/*"  
            ],  
            "Condition": {  
                "StringLike": {  
                    "aws:RequestTag/AwsVssConfig": "*"  
                }  
            }  
        },  
        {  
            "Sid": "CreateSnapshotsAccessInstance",  
            "Effect": "Allow",  
            "Action": [  
                "ec2>CreateSnapshots"  
            ],  
            "Resource": [  
                "arn:aws:ec2:*::snapshot/*"  
            ]  
        }  
    ]  
}
```

```
    "arn:aws:ec2:*::instance/*"
],
{
  "Condition": {
    "StringLike": {
      "ec2:SourceInstanceARN": "*${ec2:InstanceId}"
    }
  }
},
{
  "Sid": "CreateSnapshotsAccessVolume",
  "Effect": "Allow",
  "Action": [
    "ec2:CreateSnapshots"
  ],
  "Resource": [
    "arn:aws:ec2:*::volume/*"
  ]
},
{
  "Sid": "CreateImageWithTag",
  "Effect": "Allow",
  "Action": [
    "ec2:CreateImage"
  ],
  "Resource": [
    "arn:aws:ec2:*::snapshot/*",
    "arn:aws:ec2:*::image/*"
  ],
  "Condition": {
    "StringLike": {
      "aws:RequestTag/AwsVssConfig": "*"
    }
  }
},
{
  "Sid": "CreateImageAccessInstance",
  "Effect": "Allow",
  "Action": [
    "ec2:CreateImage"
  ],
  "Resource": [
    "arn:aws:ec2:*::instance/*"
  ],
  "Condition": {
```

```
        "StringLike": {
            "ec2:SourceInstanceARN": "*${ec2:InstanceId}"
        }
    },
{
    "Sid": "CreateTagsOnResourceCreation",
    "Effect": "Allow",
    "Action": "ec2:CreateTags",
    "Resource": [
        "arn:aws:ec2:*::snapshot/*",
        "arn:aws:ec2:*::image/*"
    ],
    "Condition": {
        "StringEquals": {
            "ec2:CreateAction": [
                "CreateImage",
                "CreateSnapshots"
            ]
        }
    }
},
{
    "Sid": "CreateTagsAfterResourceCreation",
    "Effect": "Allow",
    "Action": "ec2:CreateTags",
    "Resource": [
        "arn:aws:ec2:*::snapshot/*",
        "arn:aws:ec2:*::image/*"
    ],
    "Condition": {
        "StringLike": {
            "ec2:ResourceTag/AwsVssConfig": "*"
        },
        "ForAllValues:StringEquals": {
            "aws:TagKeys": [
                "AppConsistent",
                "Device"
            ]
        }
    }
},
{
    "Sid": "DescribeImagesAndSnapshots",
```

```
        "Effect": "Allow",
        "Action": [
            "ec2:DescribeImages",
            "ec2:DescribeSnapshots"
        ],
        "Resource": "*"
    }
]
}
```

Streamline permissions for specific use cases (advanced)

The AWSEC2VssSnapshotPolicy managed policy includes permissions for all of the ways that you can create VSS-enabled snapshots. You can create a custom policy that includes only the permissions that you need.

Use case: Create AMI, Use case: Use AWS Backup service

If you exclusively use the `CreateAmi` option, or if you create VSS-enabled snapshots only through the AWS Backup service, then you can streamline the policy statements as follows.

- Omit policy statements identified by the following statement IDs (SIDs):
 - `CreateSnapshotsWithTag`
 - `CreateSnapshotsAccessInstance`
 - `CreateSnapshotsAccessVolume`
- Adjust the `CreateTagsOnResourceCreation` statement as follows:
 - Remove `arn:aws:ec2:*:*:snapshot/*` from the resources.
 - Remove `CreateSnapshots` from the `ec2:CreateAction` condition.
- Adjust the `CreateTagsAfterResourceCreation` statement to remove `arn:aws:ec2:*:*:snapshot/*` from the resources.
- Adjust the `DescribeImagesAndSnapshots` statement to remove `ec2:DescribeSnapshots` from the statement action.

Use case: Snapshot only

If you don't use the `CreateAmi` option, then you can streamline the policy statements as follows.

- Omit policy statements identified by the following statement IDs (SIDs):

- CreateImageAccessInstance
- CreateImageWithTag
- Adjust the CreateTagsOnResourceCreation statement as follows:
 - Remove arn:aws:ec2:*:*:image/* from the resources.
 - Remove CreateImage from the ec2:CreateAction condition.
- Adjust the CreateTagsAfterResourceCreation statement to remove arn:aws:ec2:*:*:image/* from the resources.
- Adjust the DescribeImagesAndSnapshots statement to remove ec2:DescribeImages from the statement action.

 **Note**

To ensure that your customized policy performs as expected, we recommend that you regularly review and incorporate updates to the managed policy.

Legacy policy (no longer supported)

The legacy policy that grants permission for VSS-enabled snapshots includes the IAM permissions that were recommended prior to the release of the AWSEC2VssSnapshotPolicy managed policy.

If you've configured an instance role with the legacy policy, you can continue using it. However, to ensure that your policy stays current with the latest IAM best practices and scopes policy statements accordingly, we recommend that you replace the legacy policy with the AWSEC2VssSnapshotPolicy managed policy.

Policy example

The following policy example uses the ec2:DescribeInstanceAttribute that's supported in AwsVssComponents package versions 2.2.1 and later. If you have an older version of the AwsVssComponents package installed, you should replace that with the ec2:DescribeInstances action.

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {
```

```
"Effect": "Allow",
"Action": "ec2:CreateTags",
"Resource": [
    "arn:aws:ec2:*::snapshot/*",
    "arn:aws:ec2:*::image/*"
]
},
{
    "Effect": "Allow",
    "Action": [
        "ec2:DescribeInstanceAttribute",
        "ec2:CreateSnapshot",
        "ec2:CreateSnapshots",
        "ec2:CreateImage",
        "ec2:DescribeImages",
        "ec2:DescribeSnapshots"
    ],
    "Resource": "*"
}
]
```

For more information about IAM managed policies, see [AWS managed policies](#) in the *IAM User Guide*.

VSS components

To create application-consistent snapshots on Windows operating systems, the AwsVssComponents package must be installed on the instance. The package contains an on-instance EC2 VSS Agent that functions as the VSS requester, and an EC2 VSS provider for EBS volumes.

There are several ways that you can install the component onto an existing instance:

- (Recommended) [Run the AWSEC2-VssInstallAndSnapshot command document \(recommended\)](#). This automatically installs or updates if needed every time it runs.
- [Manually install VSS components on an instance](#).
- [Update VSS components on your instances on a schedule](#).

You can also create an AMI with EC2 Image Builder that uses the aws-vss-components-windows managed component to install the AwsVssComponents package for the image. The managed

component uses AWS Systems Manager Distributor to install the package. After Image Builder creates the image, every instance that you launch from the associated AMI will have the VSS package installed on it. For more information about how you can create an AMI with the VSS package installed, see [Distributor package managed components for Windows](#) in the *EC2 Image Builder User Guide*.

Contents

- [Manually install VSS components on an instance](#)
- [Update VSS components on your instances on a schedule](#)

Manually install VSS components on an instance

Your EC2 Windows instance must have VSS components installed before you can create application-consistent snapshots with Systems Manager. If you don't run the AWSEC2-VssInstallAndSnapshot command document to automatically install or update the package every time you create application-consistent snapshots, you must manually install the package.

You must also install manually if you plan to use one of the following methods to create application-consistent snapshots from your EC2 instance.

- Create VSS snapshots using AWS Backup
- Create VSS snapshots using Amazon Data Lifecycle Manager

If you need to perform a manual install, we recommend that you use the latest AWS VSS component package to improve the reliability and performance of application-consistent snapshots on your EC2 Windows instances.

Note

To automatically install or update the AwsVssComponents package whenever you create application-consistent snapshots, we recommend that you use Systems Manager to run the AWSEC2-VssInstallAndSnapshot document. For more information, see [Run the AWSEC2-VssInstallAndSnapshot command document \(recommended\)](#).

To install the VSS components on an Amazon EC2 Windows instance, follow the steps for your preferred environment.

Console

To install the VSS components using SSM Distributor

1. Open the AWS Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
2. In the navigation pane, choose **Run Command**.
3. Choose **Run command**.
4. For **Command document**, choose the button next to **AWS-ConfigureAWSPackage**.
5. For **Command parameters**, do the following:
 - a. Verify that **Action** is set to **Install**.
 - b. For **Name**, enter **AwsVssComponents**.
 - c. For **Version**, enter a version or leave the field empty so that Systems Manager installs the latest version.
6. For **Targets**, identify the instances on which you want to run this operation by specifying tags or selecting instances manually.

 **Note**

If you choose to select instances manually, and an instance you expect to see is not included in the list, see [Where Are My Instances?](#) in the *AWS Systems Manager User Guide* for troubleshooting tips.

7. For **Other parameters**:
 - (Optional) For **Comment**, type information about this command.
 - For **Timeout (seconds)**, specify the number of seconds for the system to wait before failing the overall command execution.
8. (Optional) For **Rate control**:
 - For **Concurrency**, specify either a number or a percentage of instances on which to run the command at the same time.

Note

If you selected targets by choosing Amazon EC2 tags, and you are not certain how many instances use the selected tags, then limit the number of instances that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other instances after it fails on either a number or a percentage of instances. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Instances still processing the command might also send errors.
9. (Optional) For **Output options** section, if you want to save the command output to a file, select the box next to **Enable writing to an S3 bucket**. Specify the bucket and (optional) prefix (folder) names.

Note

The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile assigned to the instance, not those of the user performing this task. For more information, see [Create an IAM Instance Profile for Systems Manager](#) in the *AWS Systems Manager User Guide*.

10. (Optional) Specify options for **SNS notifications**.

For information about configuring Amazon SNS notifications for Run Command, see [Configuring Amazon SNS Notifications for AWS Systems Manager](#).

11. Choose **Run**.

AWS CLI

Use the following procedure to download and install the AwsVssComponents package on your instances by using Run Command from the AWS CLI. The package installs two components: a VSS requester and a VSS provider. The system copies these components to a directory on the instance, and then registers the provider DLL as a VSS provider.

To install the VSS package by using the AWS CLI

- Run the following command to download and install the required VSS components for Systems Manager.

```
aws ssm send-command \
--document-name "AWS-ConfigureAWSPackage" \
--instance-ids "i-01234567890abcdef" \
--parameters '{"action":["Install"],"name":["AwsVssComponents"]}'
```

PowerShell

Use the following procedure to download and install the AwsVssComponents package on your instances by using Run Command from the Tools for Windows PowerShell. The package installs two components: a VSS requester and a VSS provider. The system copies these components to a directory on the instance, and then registers the provider DLL as a VSS provider.

To install the VSS package using the AWS Tools for Windows PowerShell

- Run the following command to download and install the required VSS components for Systems Manager.

```
Send-SSMCommand -DocumentName AWS-ConfigureAWSPackage -InstanceId
"i-01234567890abcdef" -Parameter
@{'action'='Install'; 'name'='AwsVssComponents'}
```

Verify the signature on AWS VSS components

Use the following procedure to verify the signature on the AwsVssComponents package.

- Connect to your Windows instance. For more information, see [Connect to your Windows instance](#).
- Navigate to C:\Program Files\Amazon\AwsVssComponents.
- Open the context (right-click) menu for ec2-vss-agent.exe, and then choose **Properties**.
- Navigate to the **Digital Signatures** tab and verify that the name of the signer is Amazon Web Services Inc.

5. Use the preceding steps to verify the signature on Ec2VssInstaller and Ec2VssProvider.dll.

Update VSS components on your instances on a schedule

We recommend that you keep the VSS components updated with the latest recommended version. There are several different ways that you can update components when a new version of the AwsVssComponents package is released.

Update methods

- You can repeat the steps described in [Manually install VSS components on an instance](#) when a new version of the AWS VSS components is released.
- You can configure a Systems Manager State Manager association to automatically download and install new or updated VSS components when the AwsVssComponents package becomes available.
- You can automatically install or update the AwsVssComponents package whenever you create application-consistent snapshots, when you use Systems Manager to run the AWSEC2-VssInstallAndSnapshot document.

Note

We recommend that you use Systems Manager to run the AWSEC2-VssInstallAndSnapshot command document, which automatically installs or updates the AwsVssComponents package before it creates the application-consistent snapshots. For more information, see [Run the AWSEC2-VssInstallAndSnapshot command document \(recommended\)](#).

To create a Systems Manager State Manager association, follow the steps for your preferred environment.

Console

To create a State Manager association using the console

1. Open the AWS Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.

2. In the navigation pane, choose **State Manager**.

Or, if the Systems Manager homepage opens first, open the navigation pane and then choose **State Manager**.

3. Choose **Create association**.
4. In the **Name** field, enter a descriptive name.
5. In the **Document** list, choose **AWS-ConfigureAWSPackage**.
6. In the **Parameters** section, choose **Install** from the **Action** list.
7. For **Installation type**, choose **Uninstall and reinstall**.
8. In the **Name** field, enter **AwsVssComponents**. You can keep the **Version** and **Additional Arguments** fields empty.
9. In the **Targets** section, choose an option.

 **Note**

If you choose to target instances by using tags, and you specify tags that map to Linux instances, the association succeeds on the Windows instance but fails on the Linux instances. The overall status of the association shows **Failed**.

10. In the **Specify schedule** section, choose an option.
11. In the **Advanced options** section, for **Compliance severity**, choose a severity level for the association. For more information, see [About State Manager association compliance](#). For **Change Calendars**, select a preconfigured change calendar. For more information, see about [AWS Systems Manager Change Calendar](#).
12. For **Rate control**, do the following:
 - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.
 - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes.
13. (Optional) For **Output options**, to save the command output to a file, select **Enable writing output to S3**. Enter the bucket and prefix (folder) names in the boxes.
14. Choose **Create association**, and then choose **Close**. The system attempts to create the association on the instances and immediately apply the state.

Note

If EC2 instances for Windows Server show a status of **Failed**, verify that the SSM Agent is running on the instance, and verify that the instance is configured with an AWS Identity and Access Management (IAM) role for Systems Manager. For more information, see [Setting up AWS Systems Manager](#).

AWS CLI

You can run [create-association](#) AWS CLI command to update a Distributor package on a schedule without taking the associated application offline. Only new or updated files in the package are replaced.

To create a State Manager association using the AWS CLI

1. Install and configure the AWS CLI, if you haven't already. For information, see [Install or update the latest version of the AWS CLI](#).
2. Run the following command to create an association. The value of --name, the document name, is always AWS-ConfigureAWSPackage. The following command uses the key InstanceIds to specify target instances.

```
aws ssm create-association \
--name "AWS-ConfigureAWSPackage" \
--parameters '{"action":["Install"],"installationType":["Uninstall and
reinstall"],"name":["AwsVssComponents"]}' \
--targets [{"Key":"InstanceIds","Values":["i-01234567890abcdef",
"i-00001112222abcde"]}]
```

For information about other options you can use with the `create-association` command, see [create-association](#) in the AWS Systems Manager section of the AWS CLI Command Reference.

Create VSS-enabled EBS snapshots

This section includes the steps to create VSS-enabled EBS snapshots.

You can create VSS-enabled EBS snapshots of EBS volumes attached to your EC2 instances. Before you attempt to create a VSS-enabled snapshot, ensure that the [Prerequisites](#) are met.

Topics

- [Create VSS snapshots with AWS Systems Manager command documents](#)
- [Create VSS snapshots using AWS Backup](#)
- [Create VSS snapshots using Amazon Data Lifecycle Manager](#)

Create VSS snapshots with AWS Systems Manager command documents

You can use AWS Systems Manager command documents to create VSS-enabled snapshots.

The following content introduces the command documents that are available, and the runtime parameters that the documents use to create your snapshots.

Before you use any of the Systems Manager command documents, ensure that you've met all [Prerequisites](#).

Topics

- [Parameters for Systems Manager VSS snapshot documents](#)
- [Run Systems Manager VSS snapshot command documents](#)

Parameters for Systems Manager VSS snapshot documents

The Systems Manager documents that create VSS snapshots all use the following parameters, except where noted:

ExcludeBootVolume (string, optional)

This setting excludes boot volumes from the backup process if you create snapshots. To exclude boot volumes from your snapshots, set **ExcludeBootVolume** to True, and **CreateAmi** to False.

If you create an AMI for your backup, this parameter should be set to False. The default value for this parameter is False.

NoWriters (string, optional)

To exclude application VSS writers from the snapshot process, set this parameter to True.

Excluding application VSS writers can help you resolve conflicts with third-party VSS backup components. The default value for this parameter is False.

CopyOnly (string, optional)

If you use the native SQL Server backup in addition to AWS VSS, performing a Copy-only backup prevents AWS VSS from breaking the native differential backup chain. To perform a Copy-only backup operation, set this parameter to True.

The default value for this parameter is False, which causes AWS VSS to perform a full backup operation.

CreateAmi (string, optional)

To create a VSS-enabled Amazon Machine Image (AMI) to back up your instance, set this parameter to True. The default value for this parameter is False, which backs up your instance with an EBS snapshot instead.

For more information about creating an AMI from an instance, see [Create a Windows AMI from a running instance](#).

AmiName (string, optional)

If the **CreateAmi** option is set to True, specify the name of the AMI that the backup creates.

description (string, optional)

Specify a description for the snapshots or image that this process creates.

tags (string, optional)

We recommend that you tag your snapshots and images to help you locate and manage your resources, for example, to restore volumes from a list of snapshots. The system adds the Name key, with a blank value where you can specify the name that you want to apply to your output snapshots or images.

If you want to specify additional tags, separate tags with a semicolon in between. For example, Key=Environment,Value=Test;Key=User,Value=TestUser1.

By default, the system adds the following reserved tags for VSS-enabled snapshots and images.

- **Device** – For VSS-enabled snapshots, this is the device name of the EBS volume that the snapshot captures.
- **AppConsistent** – This tag indicates the successful creation of a VSS-enabled snapshot or AMI.
- **AwsVssConfig** – This identifies snapshots and AMIs that are created with VSS enabled. The tag includes meta information such as the AwsVssComponents version.

⚠ Warning

Specifying any of these reserved tags in your parameter list will cause an error.

executionTimeout (string, optional)

Specify the maximum time in seconds to run the snapshot creation process on the instance, or to create an AMI from the instance. Increasing this timeout allows the command to wait longer for VSS to start its freeze and complete tagging of the resources it creates. This timeout only applies to the snapshot or AMI creation steps. The initial step to install or update the AwsVssComponents package is not included in the timeout.

CollectDiagnosticLogs (string, optional)

To collect more information during snapshot and AMI creation steps, set this parameter to True. The default value for this parameter is False.

VssVersion (string, optional)

For the AWSEC2-VssInstallAndSnapshot document only, you can specify the VssVersion parameter to install a specific version of AwsVssComponents package on your instance. Leave this parameter blank to install the recommended default version.

If the specified version of the AwsVssComponents package is already installed, the script skips the install step and moves on to the backup step. For a list of AwsVssComponents package versions and operating support, see [AWS VSS solution version history](#).

Run Systems Manager VSS snapshot command documents

You can create VSS-enabled EBS snapshots with AWS Systems Manager command documents as follows.

Run the AWSEC2-VssInstallAndSnapshot command document (recommended)

When you use AWS Systems Manager to run the AWSEC2-VssInstallAndSnapshot document, the script runs the following steps.

1. The script first installs or updates the AwsVssComponents package on your instance, depending on whether it's already installed.
2. The script creates the application-consistent snapshots after the first step completes.

To run the AWSEC2-VssInstallAndSnapshot document, follow the steps for your preferred environment.

Console

Create VSS-enabled EBS snapshots from the console

1. Open the AWS Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
2. Select **Run Command** from the navigation pane. This shows a list of commands that are currently running in your account, if applicable.
3. Choose **Run command**. This opens a list of command documents that you have access to.
4. Select AWSEC2-VssInstallAndSnapshot from the list of command documents. To streamline results, you can enter all or part of the document name. You can also filter by the owner, by platform types, or by tags.

When you select a command document, details populate below the list.

5. Select **Default version at runtime** from the **Document version** list.
6. Configure the **Command parameters** to define how AWSEC2-VssInstallAndSnapshot will install the AwsVssComponents package and back up with VSS snapshots or an AMI. For parameter details, see [Parameters for Systems Manager VSS snapshot documents](#).
7. For **Target selection**, specify tags or select instances manually to identify the instances on which to run this operation.

Note

If you select instances manually, and an instance you expect to see is not included in the list, see [Where Are My Instances?](#) for troubleshooting tips.

8. For additional parameters to define Systems Manager Run Command behavior such as **Rate control**, enter values as described in [Running commands from the console](#).
9. Choose **Run**.

If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the Systems Manager command output for details about why the execution failed.

If the command successfully completed, but a specific volume backup failed, you can troubleshoot the failure in the list of EBS volumes.

AWS CLI

You can run the following commands in the AWS CLI to create VSS-enabled EBS snapshots and get the status of your snapshot creation.

Create VSS-enabled EBS snapshots

Run the following command to create VSS-enabled EBS snapshots. To create the snapshots, you must identify the instances with the `--instance-ids` parameter. For more information about other parameters that you can use, see [Parameters for Systems Manager VSS snapshot documents](#).

```
aws ssm send-command \
--document-name "AWSEC2-VssInstallAndSnapshot" \
--instance-ids "i-01234567890abcdef" \
--parameters '{"ExcludeBootVolume":["False"],"description":["Description"],"tags":[{"Key=key_name,Value=tag_value],"VssVersion":[]}]'
```

If successful, the command document populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the command output for details about why the execution failed.

Get command status

To get the current status of the snapshots, run the following command using the command ID returned from `send-command`.

```
aws ssm get-command-invocation
--instance-ids "i-01234567890abcdef" \
--command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
--plugin-name "CreateVssSnapshot"
```

PowerShell

Run the following commands with AWS Tools for Windows PowerShell to create VSS-enabled EBS snapshots and get the current runtime status for the creation of your output. Specify parameters described in the prior list to modify the behavior of the snapshot process.

Create VSS-enabled EBS snapshots with Tools for Windows PowerShell

Run the following command to create VSS-enabled EBS snapshots or AMIs.

```
Send-SSMCommand -DocumentName "AWSEC2-VssInstallAndSnapshot" -InstanceId  
"i-01234567890abcdef" -Parameter  
@{'ExcludeBootVolume'='False';'description'='a_description'  
;'tags'='Key=key_name,Value=tag_value'; 'VssVersion'=''}  
;
```

Get command status

To get the current status of the snapshots, run the following command using the command ID returned from **Send-SSMCommand**.

```
Get-SSMCommandInvocationDetail -InstanceId "i-01234567890abcdef" -CommandId  
"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" -PluginName "CreateVssSnapshot"
```

If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the command output for details about why the execution failed.

Run the AWSEC2-CreateVssSnapshot command document

To run the AWSEC2-CreateVssSnapshot document, follow the steps for your preferred environment.

Console

Create VSS-enabled EBS snapshots from the console

1. Open the AWS Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
2. Select **Run Command** from the navigation pane. This shows a list of commands that are currently running in your account, if applicable.
3. Choose **Run command**. This opens a list of command documents that you have access to.
4. Select AWSEC2-CreateVssSnapshot from the list of command documents. To streamline results, you can enter all or part of the document name. You can also filter by the owner, by platform types, or by tags.

- When you select a command document, details populate below the list.
5. Select Default version at runtime from the **Document version** list.
 6. Configure the **Command parameters** to define how AWSEC2-CreateVssSnapshot will back up with VSS snapshots or an AMI. For parameter details, see [Parameters for Systems Manager VSS snapshot documents](#).
 7. For **Target selection**, specify tags or select instances manually to identify the instances on which to run this operation.

 **Note**

If you select instances manually, and an instance you expect to see is not included in the list, see [Where Are My Instances?](#) for troubleshooting tips.

8. For additional parameters to define Systems Manager Run Command behavior such as **Rate control**, enter values as described in [Running commands from the console](#).
9. Choose **Run**.

If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the Systems Manager command output for details about why the execution failed. If the command successfully completed, but a specific volume backup failed, you can troubleshoot the failure in the list of EBS volumes.

AWS CLI

You can run the following command in the AWS CLI to create VSS-enabled EBS snapshots.

Create VSS-enabled EBS snapshots

Run the following command to create VSS-enabled EBS snapshots. To create the snapshots, you must identify the instances with the `--instance-ids` parameter. For more information about other parameters that you can use, see [Parameters for Systems Manager VSS snapshot documents](#).

```
aws ssm send-command \
--document-name "AWSEC2-CreateVssSnapshot" \
```

```
--instance-ids "i-01234567890abcdef" \
--parameters '[{"ExcludeBootVolume": ["False"], "description": ["Description"], "tags": [{"Key=key_name, Value=tag_value}]}'
```

If successful, the command document populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the command output for details about why the execution failed.

PowerShell

Run the following command with AWS Tools for Windows PowerShell to create VSS-enabled EBS snapshots.

Create VSS-enabled EBS snapshots with Tools for Windows PowerShell

Run the following command to create VSS-enabled EBS snapshots. To create the snapshots, you must identify the instances with the InstanceId parameter. You can specify more than one instance to create snapshots for. For more information about other parameters that you can use, see [Parameters for Systems Manager VSS snapshot documents](#).

```
Send-SSMCommand -DocumentName AWSEC2-CreateVssSnapshot -InstanceId
"i-01234567890abcdef" -Parameter
@{ 'ExcludeBootVolume'='False'; 'description'='a_description' 
; 'tags'='Key=key_name,Value=tag_value' }
```

If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the command output for details about why the execution failed. If the command successfully completed, but a specific volume backup failed, you can troubleshoot the failure in the list of EBS snapshots.

Run command documents for a Windows Failover Cluster with shared EBS storage

You can use any of the command line procedures described in the previous section to create a VSS-enabled snapshot. The command document (AWSEC2-VssInstallAndSnapshot or AWSEC2-CreateVssSnapshot) must run on the primary node in your cluster. The document will fail on the secondary nodes as they don't have access to the shared disks. If your primary and secondary change dynamically, you can run the AWS Systems Manager Run Command document on multiple

nodes with the expectation that the command will succeed on the primary node and fail on secondary nodes.

Run the AWSEC2-ManageVssIO SSM command document

You can use the following script and the pre-defined AWSEC2-ManageVssIO SSM document to temporarily pause I/O, create VSS-enabled EBS snapshots, and restart I/O. This process runs in the context of the user who runs the command. If the user has sufficient permission to create and tag snapshots, then AWS Systems Manager can create and tag VSS-enabled EBS snapshots without the need for the additional IAM snapshot role on the instance.

In contrast, the command document (AWSEC2-VssInstallAndSnapshot or AWSEC2-CreateVssSnapshot) requires that you assign the IAM snapshot role to each instance for which you want to create EBS snapshots. If you don't want to provide additional IAM permissions to your instances for policy or compliance reasons, then you can use the following script.

Before you begin

Note the following important details about this process:

- This process uses a PowerShell script (`CreateVssSnapshotAdvancedScript.ps1`) to take snapshots of all volumes on the instances you specify, except root volumes. If you need to take snapshots of root volumes, then you must use the AWSEC2-CreateVssSnapshot SSM document.
- The script calls the AWSEC2-ManageVssIO document twice. The first time with the Action parameter set to Freeze, which pauses all I/O on the instances. The second time, the Action parameter is set to Thaw, which forces I/O to resume.
- Don't attempt to use the AWSEC2-ManageVssIO document without using the `CreateVssSnapshotAdvancedScript.ps1` script. Microsoft's VSS framework requires that the Freeze and Thaw actions be called no more than ten seconds apart, and manually calling these actions without the script could result in errors.

To create VSS-enabled EBS snapshots by using the AWSEC2-ManageVssIO SSM document

1. Download the [CreateVssSnapshotAdvancedScript.zip](#) file and extract the file contents.
2. Open `CreateVssSnapshotAdvancedScript.ps1` in a text editor, edit the sample call at the bottom of the script with a valid EC2 instance ID, snapshot description, and desired tag values, and then run the script from PowerShell.

If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the command output for details about why the execution failed. If the command was successfully completed, but a specific volume backup failed, you can troubleshoot the failure in the list of EBS volumes.

 **Note**

To automate backups, you can create an AWS Systems Manager maintenance window task that uses the AWSEC2-VssInstallAndSnapshot document. For more information, see [Working with Maintenance Windows \(Console\)](#) in the *AWS Systems Manager User Guide*.

Create VSS snapshots using AWS Backup

You can create a VSS backup when using AWS Backup by enabling VSS in the console or CLI. Ensure that you have met the [prerequisites](#) before you create the VSS-enabled backup plan. For more information, see [Creating Windows VSS backups](#) in the *AWS Backup Developer Guide*.

 **Note**

AWS Backup doesn't automatically install the AwsVssComponents package on your instance. You must perform a manual install on your instance. For more information, see [Manually install VSS components on an instance](#).

Create VSS snapshots using Amazon Data Lifecycle Manager

You can create VSS snapshots using Amazon Data Lifecycle Manager by enabling pre and post scripts in your snapshot lifecycle policies. For more information, see [Automating application-consistent snapshots with pre and post scripts](#).

 **Note**

Amazon Data Lifecycle Manager doesn't automatically install the AwsVssComponents package on your instance. You must perform a manual install on your instance. For more information, see [Manually install VSS components on an instance](#).

Troubleshooting

Before you try any other troubleshooting steps, we recommend that you verify the following details.

- Ensure that you've met all [Prerequisites](#).
- Verify that you're using the latest [Windows OS version support](#) of the AwsVssComponents package for your operating system. The issue that you've observed might have been addressed in newer versions.

Topics

- [General: Check the log files](#)
- [General: Using VSS on instances with proxy configured](#)
- [Error: Thaw pipe connection timed out, error on thaw, timeout waiting for VSS Freeze, or other timeout errors](#)
- [Error: Cannot invoke method. Method invocation is supported only on core types in this language mode](#)

General: Check the log files

If you experience problems or receive error messages when creating VSS-enabled EBS snapshots, you can view the command output in the Systems Manager console. You can also view the following logs:

- %ProgramData%\Amazon\SSM\InstanceData\InstanceID\document\orchestration\SSMCommandID\awsrunPowerShellScript\runPowerShellScript\stdout
- %ProgramData%\Amazon\SSM\InstanceData\InstanceID\document\orchestration\SSMCommandID\awsrunPowerShellScript\runPowerShellScript\stderr

You can also open the Event Viewer Windows application and choose **Windows Logs, Application** to view additional logs. To see events specifically from the EC2 Windows VSS Provider and the Volume Shadow Copy Service, filter by **Source** on the terms **Ec2VssSoftwareProvider** and **VSS**.

If you're using Systems Manager with VPC endpoints, and the Systems Manager Run Command failed, verify that you configured the following endpoint correctly: **com.amazonaws.region.ec2**.

Without the EC2 endpoint defined, the call to enumerate attached EBS volumes fails, which causes the Systems Manager command to fail. For more information about setting up VPC endpoints with Systems Manager, see [Create a Virtual Private Cloud Endpoint](#) in the *AWS Systems Manager User Guide*.

General: Using VSS on instances with proxy configured

If you experience problems when creating VSS-enabled EBS snapshots on instances that use a proxy to reach EC2 endpoints, make sure of the following:

- The proxy is configured so that the EC2 service endpoints in the instance's Region and IMDS are reachable by AWS Tools for Windows PowerShell running as SYSTEM.
- AwsVssComponents version 2.0.1 or later is installed. Starting with AwsVssComponents version 2.0.1, the EC2 VSS provider supports using the system's configured WinHTTP proxy. For more information about configuring WinHTTP proxy, see [Netsh Commands for Windows Hypertext Transfer Protocol \(WINHTTP\)](#) on the Microsoft website.

Error: Thaw pipe connection timed out, error on thaw, timeout waiting for VSS Freeze, or other timeout errors

The EC2 Windows VSS Provider might time out due to activity or services on the instance preventing VSS-enabled snapshots from proceeding in a timely manner. The Windows VSS Framework provides a non-configurable 10-second window during which communication to the file system is paused. During this time, AWSEC2-CreateVssSnapshot snapshots your volumes.

The following issues can cause the EC2 Windows VSS Provider to run into time limits during a snapshot:

- Excessive I/O to a volume
- Slow responsiveness of the EC2 API on the instance
- Fragmented volumes
- Incompatibility with some antivirus software
- Issues with a VSS Application writer
- When Module Logging is enabled for a large number of PowerShell modules, that can cause PowerShell scripts to run slowly

Most timeout issues that occur when you run the AWSEC2-CreateVssSnapshot command document are related to the workload on the instance being too high at the time of the backup. The following actions can help you take a successful snapshot:

- Retry the AWSEC2-CreateVssSnapshot command to see if the snapshot attempt is successful. If retrying succeeds in some cases, reducing the instance load might make snapshots more successful.
- Wait a while for the workload on the instance to decrease, and retry the AWSEC2-CreateVssSnapshot command. Alternatively, you can attempt snapshots when the instance is known to be under low stress.
- Attempt VSS snapshots when the antivirus software on the system is turned off. If this resolves the issue, refer to the antivirus software instructions and configure it to allow VSS snapshots.
- If there is a high volume of Amazon EC2 API calls in your account within the same Region where you're running a snapshot, API throttling might delay snapshot operations. To reduce throttling impact, use the latest AwsVssComponents package (version 2.1.0 and above, with the prerequisite permissions). This package utilizes the EC2 CreateSnapshots API action to reduce the number of mutating actions like per-volume snapshot creation and tagging.
- If you have multiple AWSEC2-CreateVssSnapshot command scripts running at the same time, you can take the following steps to reduce concurrency issues.
 - Consider scheduling snapshots during periods of lower API activity.
 - If you use **Run Command** in the Systems Manager console (or **SendCommand** in the API) to run the command script, you can use Systems Manager rate controls to reduce concurrency.

You can also use Systems Manager rate controls to reduce concurrency for services like AWS Backup that use Systems Manager to run the command script.

- Run the command `vssadmin list writers` in a shell and see if it reports any errors in the **Last error** field for any writers on the system. If any writers report a **time out** error, consider retrying snapshots when the instance is under less load.
- When you use smaller instance types like `t2 | t3 | t3a.nano` or `t2 | t3 | t3a.micro`, timeouts due to memory and CPU constraints can occur. The following actions might help reduce timeout issues.
 - Try closing memory or CPU intensive applications before taking snapshots.
 - Try taking snapshots during periods of lower instance activity.

Error: Cannot invoke method. Method invocation is supported only on core types in this language mode

You will encounter this error when the PowerShell language mode is not set to FullLanguage. The AWSEC2-CreateVssSnapshot and AWSEC2-ManageVssIo SSM documents require PowerShell to be configured to FullLanguage mode.

To verify the language mode, run the following command on the instance in a PowerShell console:

```
$ExecutionContext.SessionState.LanguageMode
```

For more information about language modes, see [about_Language_Modes](#) in the Microsoft documentation.

Restore EBS volumes from VSS-enabled EBS snapshots

You can use the `RestoreVssSnapshotSampleScript.ps1` script to restore volumes on an instance from VSS-enabled EBS snapshots. This script performs the following tasks:

- Stops an instance
- Removes all existing drives from the instance (except the boot volume, if it was excluded)
- Creates new volumes from the snapshots
- Attaches the volumes to the instance by using the device ID tag on the snapshot
- Restarts the instance

Important

The following script detaches all volumes attached to an instance, and then creates new volumes from a snapshot. Make sure that you have properly backed-up the instance. The old volumes are not deleted. If you want, you can edit the script to delete the old volumes.

To restore volumes from VSS-enabled EBS snapshots

1. Download the [RestoreVssSnapshotSampleScript.zip](#) file and extract the file contents.

2. Open `RestoreVssSnapshotSampleScript.ps1` in a text editor and edit the sample call at the bottom of the script with a valid EC2 instance ID and EBS snapshot ID, and then run the script from PowerShell.

AWS VSS solution version history

Topics

- [AwsVssComponents package versions](#)
- [Windows OS version support](#)

AwsVssComponents package versions

The following table describes the released versions of the AWS VSS component package.

Version	Details	Release date
2.3.1	Added new default tag <code>AwsVssConfig</code> to identify snapshots and AMIs created by AWS VSS.	March 7, 2024
2.2.1	<ul style="list-style-type: none">Added support for using the <code>DescribeInstanceAttribute</code> API.Bug fixes and reliability improvements.Deprecated support for Windows Server 2012 and 2012 R2. AWS VSS components version 2.2.1 installation on Windows Server 2012 and 2012 R2 will fail. AWS VSS components version 2.1.0 is the last version to support Windows Server 2012 and 2012 R2.	January 18, 2024
2.1.0	Added support for using the <code>CreateSnapshots</code> API.	November 6, 2023
2.0.1	Added support for using the WinHTTP proxy settings.	October 26, 2023

Version	Details	Release date
2.0.0	Added capability to the AWS VSS component to create snapshots and AMIs, which enables compatibility with PowerShell module logging, script block logging, and transcription features.	April 28, 2023
1.3.2.0	Fixed a case where installation failure is not reported correctly.	May 10, 2022
1.3.1.0	<ul style="list-style-type: none"> • Fixed snapshots failing on domain controllers in relation to an NTDS VSS writer logging error. • Fixed VSS agent error when uninstalling version 1.0 VSS provider. 	February 6, 2020
1.3.0.0	<ul style="list-style-type: none"> • Improved logging by reducing unwanted verbosity. • Fixed regionalization issues during installation. • Fixed return codes for some provider registration error conditions. • Fixed various installation issues. 	March 19, 2019
1.2.0.0	<ul style="list-style-type: none"> • Added command line parameters -nw (no-writers) and -copy (copy-only) to agent. • Fixed EventLog errors caused by improper memory allocation calls. 	November 15, 2018
1.1	Fixed AWS VSS components that were being used incorrectly as the default Windows Backup and Restore provider.	December 12, 2017

Version	Details	Release date
1.0	Initial release.	November 20, 2017

Windows OS version support

The following table shows which AWS VSS solution versions you should run on each version of Windows Server on Amazon EC2.

Windows Server version	AwsVssComponents version	AWSEC2-VsInstallAndSnapshot version name	AWSEC2-CREATEVSSAPSHOT version name	AWSEC2-MANAGEVSSIO version name
Windows Server 2022	default	default	default	default
Windows Server 2019	default	default	default	default
Windows Server 2016	default	default	default	default
Windows Server 2012 R2	2.1.0	not supported	2012R2	2012R2
Windows Server 2012	2.1.0	not supported	2012R2	2012R2

Windows Server version	AwsVssComponents version	AWSEC2-VsInstallAndSnapshot version name	AWSEC2-CreateVssSnapshot version name	AWSEC2-ManageVssIO version name
Windows Server 2008 R2	1.3.1.0	not supported	2008R2	2008R2

Resources and tags

Amazon EC2 provides different *resources* that you can create and use. Some of these resources include images, instances, volumes, and snapshots. When you create a resource, we assign the resource a unique resource ID.

Some resources can be tagged with values that you define, to help you organize and identify them.

The following topics describe resources and tags, and how you can work with them.

Contents

- [Recycle Bin](#)
- [Resource locations](#)
- [Resource IDs](#)
- [List and filter your resources](#)
- [Amazon EC2 Global View](#)
- [Tag your Amazon EC2 resources](#)
- [Amazon EC2 service quotas](#)
- [Amazon EC2 usage reports](#)

Recycle Bin

Recycle Bin is a data recovery feature that enables you to restore accidentally deleted Amazon EBS snapshots and EBS-backed AMIs. When using Recycle Bin, if your resources are deleted, they are retained in the Recycle Bin for a time period that you specify before being permanently deleted.

You can restore a resource from the Recycle Bin at any time before its retention period expires. After you restore a resource from the Recycle Bin, the resource is removed from the Recycle Bin and you can use it in the same way that you use any other resource of that type in your account. If the retention period expires and the resource is not restored, the resource is permanently deleted from the Recycle Bin and it is no longer available for recovery.

Using Recycle Bin helps to ensure business continuity by protecting your business-critical data against accidental deletion.

- [Work with resources in the Recycle Bin](#)
- [Monitor Recycle Bin](#)

How does it work?

To enable and use Recycle Bin, you must create *retention rules* in the AWS Regions in which you want to protect your resources. Retention rules specify the following:

- The resource type that you want to protect.
- The resources that you want to retain in the Recycle Bin when they are deleted.
- The retention period for which to retain resources in the Recycle Bin before they are permanently deleted.

With Recycle Bin, you can create two types of retention rules:

- **Tag-level retention rules** — A tag-level retention rule uses resource tags to identify the resources that are to be retained in the Recycle Bin. For each retention rule, you specify one or more tag key and value pairs. Resources of the specified type that are tagged with at least one of the tag key and value pairs that are specified in the retention rule are automatically retained in the Recycle Bin upon deletion. Use this type of retention rule if you want to protect specific resources in your account based on their tags.
- **Region-level retention rules** — A Region-level retention rule does not have any resource tags specified. It applies to all of the resources of the specified type in the Region in which the rule is created, even if the resources are not tagged. Use this type of retention rule if you want to protect all resources of a specific type in a specific Region.

While a resource is in the Recycle Bin, you have the ability to restore it for use at any time.

The resource remains in the Recycle Bin until one of the following happens:

- You manually restore it for use. When you restore a resource from the Recycle Bin, the resource is removed from the Recycle Bin and it immediately becomes available for use. You can use restored resources in the same way as any other resource of that type in your account.
- The retention period expires. If the retention period expires, and the resource has not been restored from the Recycle Bin, the resource is permanently deleted from the Recycle Bin and it can no longer be viewed or restored.

Supported resources

Recycle Bin supports the following resource types:

- Amazon EBS snapshots

 **Important**

Recycle Bin retention rules also apply to archived snapshots in the archive storage tier. If you delete an archived snapshot that matches a retention rule, that snapshot is retained in the Recycle Bin for the period defined in the retention rule. Archived snapshots are billed at the rate for archived snapshots while they are in the Recycle Bin.

- Amazon EBS-backed Amazon Machine Images (AMIs)

 **Note**

Retention rules also apply to disabled AMIs.

Considerations

The following considerations apply when working with Recycle Bin and retention rules.

General considerations

- **⚠️ Important**

When you create your first retention rule, it can take up to 30 minutes for the rule to become active and for it to start retaining resources. After you create the first retention rule, subsequent retention rules become active and start retaining resources almost immediately.
- If a resource matches more than one retention rule upon deletion, then the retention rule with the longest retention period takes precedence.
- You can't manually delete a resource from the Recycle Bin. The resource will be automatically deleted when its retention period expires.
- While a resource is in the Recycle Bin, you can only view it, restore it, or modify its tags. To use the resource in any other way, you must first restore it.
- If any AWS service, such as AWS Backup or Amazon Data Lifecycle Manager, deletes a resource that matches a retention rule, that resource is automatically retained by Recycle Bin.
- When a resource is sent to the Recycle Bin, the following system-generate tag is assigned to the resource:
 - Tag key — `aws:recycle-bin:resource-in-bin`
 - Tag value — `true`You can't manually edit or delete this tag. When the resource is restored from the Recycle Bin, the tag is automatically removed.

Considerations for snapshots

- **⚠️ Important**

If you have retention rules for AMIs and for their associated snapshots, make the retention period for the snapshots the same or longer than the retention period for the AMIs. This ensures that Recycle Bin does not delete the snapshots associated with an AMI before deleting the AMI itself, as this would make the AMI unrecoverable.
- If a snapshot is enabled for fast snapshot restore when it is deleted, fast snapshot restore is automatically disabled shortly after the snapshot is sent to the Recycle Bin.

- If you restore the snapshot before fast snapshot restore is disabled for the snapshot, it remains enabled.
- If you restore the snapshot, after fast snapshot restore has been disabled, it remains disabled. If needed, you must manually re-enable fast snapshot restore.
- If a snapshot is shared when it is deleted, it is automatically unshared when it is sent to the Recycle Bin. If you restore the snapshot, all of the previous sharing permissions are automatically restored.
- If a snapshot that was created by another AWS service, such as AWS Backup is sent to the Recycle Bin and you later restore that snapshot from the Recycle Bin, it is no longer managed by the AWS service that created it. You must manually delete the snapshot if it is no longer needed.

Considerations for AMIs

- Only Amazon EBS-backed AMIs are supported.

 **Important**

If you have retention rules for AMIs and for their associated snapshots, make the retention period for the snapshots the same or longer than the retention period for the AMIs. This ensures that Recycle Bin does not delete the snapshots associated with an AMI before deleting the AMI itself, as this would make the AMI unrecoverable.

- If an AMI is shared when it is deleted, it is automatically unshared when it is sent to the Recycle Bin. If you restore the AMI, all of the previous sharing permissions are automatically restored.
- Before you can restore an AMI from the Recycle Bin, you must first restore all of its associated snapshots from the Recycle Bin and ensure that they are in the available state.
- If the snapshots that are associated with the AMI are deleted from the Recycle Bin, the AMI is no longer recoverable. The AMI will be deleted when the retention period expires.
- If an AMI that was created by another AWS service, such as AWS Backup, is sent to the Recycle Bin and you later restore that AMI from the Recycle Bin, it is no longer managed by the AWS service that created it. You must manually delete the AMI if it is no longer needed.

Considerations for Amazon Data Lifecycle Manager snapshot policies

- If Amazon Data Lifecycle Manager deletes a snapshot that matches a retention rule, that snapshot is automatically retained by Recycle Bin.

- If Amazon Data Lifecycle Manager deletes a snapshot and sends it to the Recycle Bin when the policy's retention threshold is reached, and you manually restore the snapshot from the Recycle Bin, you must manually delete that snapshot when it is no longer needed. Amazon Data Lifecycle Manager will no longer manage the snapshot.
- If you manually delete a snapshot that was created by a policy, and that snapshot is in the Recycle Bin when the policy's retention threshold is reached, Amazon Data Lifecycle Manager will not delete the snapshot. Amazon Data Lifecycle Manager does not manage the snapshots while they are stored in the Recycle Bin.

If the snapshot is restored from the Recycle Bin before the policy's retention threshold is reached, Amazon Data Lifecycle Manager will delete the snapshot when the policy's retention threshold is reached.

If the snapshot is restored from the Recycle Bin after the policy's retention threshold is reached, Amazon Data Lifecycle Manager will no longer delete the snapshot. You must manually delete the snapshot when it is no longer needed.

Considerations for AWS Backup

- If AWS Backup deletes a snapshot that matches a retention rule, that snapshot is automatically retained by Recycle Bin.

Considerations for archived snapshots

- Recycle Bin retention rules also apply to archived snapshots in the archive storage tier. If you delete an archived snapshot that matches a retention rule, that snapshot is retained in the Recycle Bin for the period defined in the retention rule.

Archived snapshots are billed at the rate for archived snapshots while they are in the Recycle Bin.

If a retention rule deletes an archived snapshot from the Recycle Bin before the minimum archive period of 90 days, you are billed for the remaining days. For more information, see [Archived snapshot pricing and billing](#) in the *Amazon EBS User Guide*.

To use an archived snapshot that is in the Recycle Bin, you must first recover the snapshot from the Recycle Bin and then restore it from the archive tier to the standard tier.

Quotas

The following quotas apply to Recycle Bin.

Quota	Default quota			
Retention rules per Region	250			
Tag key and value pairs per retention rule	50			

Related services

Recycle Bin works with the following services:

- **AWS CloudTrail** — Enables you to record events that occur in Recycle Bin. For more information, see [Monitor Recycle Bin using AWS CloudTrail](#).

Pricing

Resources in the Recycle Bin are billed at their standard rates. There are no additional charges for using Recycle Bin and retention rules. For more information, see [Amazon EBS pricing](#).

Note

Some resources might still appear in the Recycle Bin console or in the AWS CLI and API output for a short period after their retention periods have expired and they have been permanently deleted. You are not billed for these resources. Billing stops as soon as the retention period expires.

You can use the following AWS generated cost allocation tags for cost tracking and allocation purposes when using AWS Billing and Cost Management.

- Key: aws:recycle-bin:resource-in-bin
- Value: true

For more information, see [AWS-generated cost allocation tags](#) in the *AWS Billing and Cost Management User Guide*.

Required IAM permissions

By default, users don't have permission to work with Recycle Bin, retention rules, or with resources that are in the Recycle Bin. To allow users to work with these resources, you must create IAM policies that grant permission to use specific resources and API actions. Once the policies are created, you must add permissions to your users, groups, or roles.

Topics

- [Permissions for working with Recycle Bin and retention rules](#)
- [Permissions for working with resources in the Recycle Bin](#)
- [Condition keys for Recycle Bin](#)

Permissions for working with Recycle Bin and retention rules

To work with Recycle Bin and retention rules, users need the following permissions.

- rbin:CreateRule
- rbin:UpdateRule
- rbin:GetRule
- rbin>ListRules
- rbin>DeleteRule
- rbin:TagResource
- rbin:UntagResource
- rbin>ListTagsForResource
- rbin:LockRule
- rbin:UnlockRule

To use the Recycle Bin console, users need the tag:GetResources permission.

The following is an example IAM policy that includes the `tag:GetResources` permission for console users. If some permissions are not needed, you can remove them from the policy.

```
{  
    "Version": "2012-10-17",  
    "Statement": [{  
        "Effect": "Allow",  
        "Action": [  
            "rbin>CreateRule",  
            "rbin>UpdateRule",  
            "rbin>GetRule",  
            "rbin>ListRules",  
            "rbin>DeleteRule",  
            "rbin>TagResource",  
            "rbin>UntagResource",  
            "rbin>ListTagsForResource",  
            "rbin>LockRule",  
            "rbin>UnlockRule",  
            "tag:GetResources"  
        ],  
        "Resource": "*"  
    }]  
}
```

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center User Guide*.

- Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.

- IAM users:

- Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.
- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

Permissions for working with resources in the Recycle Bin

For more information about the IAM permissions needed to work with resources in the Recycle Bin, see the following:

- [Permissions for working with snapshots in the Recycle Bin](#)
- [Permissions for working with AMIs in the Recycle Bin](#)

Condition keys for Recycle Bin

Recycle Bin defines the following condition keys that you can use in the Condition element of an IAM policy to control the conditions under which the policy statement applies. For more information, see [IAM JSON policy elements: Condition](#) in the *IAM User Guide*.

Topics

- [rbin:Request/ResourceType condition key](#)
- [rbin:Attribute/ResourceType condition key](#)

rbin:Request/ResourceType condition key

The rbin:Request/ResourceType condition key can be used to filter access on [CreateRule](#) and [ListRules](#) requests based on the value specified for the ResourceType request parameter.

Example 1 - CreateRule

The following sample IAM policy allows IAM principals to make **CreateRule** requests only if the value specified for the ResourceType request parameter is EBS_SNAPSHOT or EC2_IMAGE. This allows the principal to create new retention rules for snapshots and AMIs only.

```
{  
    "Version" : "2012-10-17",  
    "Statement" : [  
        {  
            "Effect" : "Allow",  
            "Action" : [  
                "rbin:CreateRule"  
            ],  
            "Resource" : "*"  
        }  
    ]  
}
```

```
        "Condition" : {
            "StringEquals" : {
                "rbin:Request/ResourceType" : ["EBS_SNAPSHOT", "EC2_IMAGE"]
            }
        }
    ]
}
```

Example 2 - ListRules

The following sample IAM policy allows IAM principals to make **ListRules** requests only if the value specified for the ResourceType request parameter is EBS_SNAPSHOT. This allows the principal to list retention rules for snapshots only, and it prevents them from listing retention rules for any other resource type.

```
{
    "Version" : "2012-10-17",
    "Statement" : [
        {
            "Effect" : "Allow",
            "Action" : [
                "rbin>ListRules"
            ],
            "Resource" : "*",
            "Condition" : {
                "StringEquals" : {
                    "rbin:Request/ResourceType" : "EBS_SNAPSHOT"
                }
            }
        }
    ]
}
```

rbin:Attribute/ResourceType condition key

The rbin:Attribute/ResourceType condition key can be used to filter access on [DeleteRule](#), [GetRule](#), [UpdateRule](#), [LockRule](#), [UnlockRule](#), [TagResource](#), [UntagResource](#), and [ListTagsForResource](#) requests based on the value of the retention rule's ResourceType attribute.

Example 1 - UpdateRule

The following sample IAM policy allows IAM principals to make **UpdateRule** requests only if the `ResourceType` attribute of the requested retention rule is `EBS_SNAPSHOT` or `EC2_IMAGE`. This allows the principal to update retention rules for snapshots and AMIs only.

```
{  
    "Version" : "2012-10-17",  
    "Statement" : [  
        {  
            "Effect" : "Allow",  
            "Action" : [  
                "rbin:UpdateRule"  
            ],  
            "Resource" : "*",  
            "Condition" : {  
                "StringEquals" : {  
                    "rbin:Attribute/ResourceType" : ["EBS_SNAPSHOT", "EC2_IMAGE"]  
                }  
            }  
        }  
    ]  
}
```

Example 2 - DeleteRule

The following sample IAM policy allows IAM principals to make **DeleteRule** requests only if the `ResourceType` attribute of the requested retention rule is `EBS_SNAPSHOT`. This allows the principal to delete retention rules for snapshots only.

```
{  
    "Version" : "2012-10-17",  
    "Statement" : [  
        {  
            "Effect" : "Allow",  
            "Action" : [  
                "rbin:DeleteRule"  
            ],  
            "Resource" : "*",  
            "Condition" : {  
                "StringEquals" : {  
                    "rbin:Attribute/ResourceType" : "EBS_SNAPSHOT"  
                }  
            }  
        }  
    ]  
}
```

```
    }  
]  
}
```

Work with retention rules

To enable and use Recycle Bin, you must create *retention rules* in the AWS Regions in which you want to protect your resources. Retention rules specify the following:

- The resource type that you want to protect.
- The resources that you want to retain in the Recycle Bin when they are deleted.
- The retention period for which to retain resources in the Recycle Bin before they are permanently deleted.

With Recycle Bin, you can create two types of retention rules:

- **Tag-level retention rules** — A tag-level retention rule uses resource tags to identify the resources that are to be retained in the Recycle Bin. For each retention rule, you specify one or more tag key and value pairs. Resources of the specified type that are tagged with at least one of the tag key and value pairs that are specified in the retention rule are automatically retained in the Recycle Bin upon deletion. Use this type of retention rule if you want to protect specific resources in your account based on their tags.
- **Region-level retention rules** — A Region-level retention rule does not have any resource tags specified. It applies to all of the resources of the specified type in the Region in which the rule is created, even if the resources are not tagged. Use this type of retention rule if you want to protect all resources of a specific type in a specific Region.

After you create a retention rule, resources that match its criteria are automatically retained in the Recycle Bin for the specified retention period after they are deleted.

Topics

- [Create a retention rule](#)
- [View Recycle Bin retention rules](#)
- [Update retention rules](#)
- [Lock retention rules](#)
- [Unlock retention rules](#)

- [Tag retention rules](#)
- [View retention rule tags](#)
- [Remove tags from retention rules](#)
- [Delete Recycle Bin retention rules](#)

Create a retention rule

When you create a retention rule, you must specify the following required parameters:

- The resource type that is to be protected by the retention rule.
- The resources that are to be protected by the retention rule. You can create retention rules at the tag level and the Region level.
 - To create a tag-level retention rule, specify the resource tags that identify the resources to protect. You can specify up to 50 tags for each rule, and add the same tag key and value pair to a maximum of five retention rules.
 - To create a Region-level retention rule, do not specify any tag key and value pairs. In this case, all resources of the specified type are protected.
- The period to retain the resources in the Recycle Bin after they are deleted. The period can be up to 1 year (365 days).

You can also specify the following optional parameters:

- An optional name for the retention rule. The name can be up to 255 characters long.
- An optional description for the retention rule. The description can be up to 255 characters long.

 **Note**

We recommend that you do not include personally identifying, confidential, or sensitive information in the retention rule description.

- Optional retention rule tags to help identify and organize your retention rules. You can assign up to 50 tags to each rule.

You can also optionally lock retention rules on creation. If you lock a retention rule on creation, you must also specify the unlock delay period, which can be 7 to 30 days. Retention rules remain unlocked by default unless you explicitly lock them.

Retention rules function only in the Regions in which they are created. If you intend to use Recycle Bin in other Regions, you must create additional retention rules in those Regions.

You can create a Recycle Bin retention rule using one of the following methods.

Recycle Bin console

To create a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation pane, choose **Retention rules**, and then choose **Create retention rule**.
3. In the **Rule details** section, do the following:
 - a. *(Optional)* For **Retention rule name**, enter a descriptive name for the retention rule.
 - b. *(Optional)* For **Retention rule description**, enter a brief description for the retention rule.
4. In the **Rule settings** section, do the following:
 - a. For **Resource type**, select choose the type of resource for the retention rule to protect. The retention rule will retain only resources of this type in the Recycle Bin.
 - b. Do one of the following:
 - To create a Region-level retention rule that matches all deleted resources of the specified type in the Region, select **Apply to all resources**. The retention rule will retain all deleted resources of the specified in the Recycle Bin upon deletion, even if the resources do not have any tags.
 - To create a tag-level retention rule, for **Resource tags to match**, enter the tag key and value pairs to use to identify resource of the specified type that are to be retained in the Recycle Bin. Only resources of the specified type that have at least one of the specified tag key and value pairs will be retained by the retention rule.
 - c. For **Retention period**, enter the number of days for which the retention rule is to retain resources in the Recycle Bin.
5. *(Optional)* To lock the retention rule, for **Rule lock settings**, select **Lock**, and then for **Unlock delay period**, specify the unlock delay period in days. A locked retention rule can't

be modified or deleted. To modify or delete the rule, you must first unlock it and then wait for the unlock delay period to expire. For more information, see [Lock retention rules](#)

To leave the retention rule unlocked, for **Rule lock settings**, keep **Unlock** selected. An unlocked retention rule can be modified or deleted at any time. For more information, see [Unlock retention rules](#).

6. *(Optional)* In the **Tags** section, do the following:

- To tag the rule with custom tags, choose **Add tag** and then enter the tag key and value pair.

7. Choose **Create retention rule**.

AWS CLI

To create a retention rule

Use the [create-rule](#) AWS CLI command. For **--retention-period**, specify the number of days to retain deleted snapshots in the Recycle Bin. For **--resource-type**, specify **EBS_SNAPSHOT** for snapshots or **EC2_IMAGE** for AMIs. To create a tag-level retention rule, for **--resource-tags**, specify the tags to use to identify the snapshots that are to be retained. To create a Region-level retention rule, omit **--resource-tags**. To lock a retention rule, include **--lock-configuration**, and specify the unlock delay period in days.

```
C:\> aws rbin create-rule \
--retention-period RetentionPeriodValue=number_of_days,RetentionPeriodUnit=DAYs \
--resource-type EBS_SNAPSHOT|EC2_IMAGE \
--description "rule_description" \
--lock-configuration
'UnlockDelay={UnlockDelayUnit=DAYs,UnlockDelayValue=unlock_delay_in_days}' \
--resource-tags ResourceTagKey=tag_key,ResourceTagValue=tag_value
```

Example 1

The following example command creates an unlocked Region-level retention rule that retains all deleted snapshots for a period of 7 days.

```
C:\> aws rbin create-rule \
--retention-period RetentionPeriodValue=7,RetentionPeriodUnit=DAYs \
--resource-type EBS_SNAPSHOT \
```

```
--description "Match all snapshots"
```

Example 2

The following example command creates a tag-level rule that retains deleted snapshots that are tagged with purpose=production for a period of 7 days.

```
C:\> aws rbin create-rule \
--retention-period RetentionPeriodValue=7,RetentionPeriodUnit=DAYS \
--resource-type EBS_SNAPSHOT \
--description "Match snapshots with a specific tag" \
--resource-tags ResourceTagKey=purpose,ResourceTagValue=production
```

Example 3

The following example command creates a locked Region-level retention rule that retains all deleted snapshots for a period of 7 days. The retention rule is locked with an unlock delay period of 7 days.

```
C:\> aws rbin create-rule \
--retention-period RetentionPeriodValue=7,RetentionPeriodUnit=DAYS \
--resource-type EBS_SNAPSHOT \
--description "Match all snapshots" \
--lock-configuration 'UnlockDelay={UnlockDelayUnit=DAY,UnlockDelayValue=7}'
```

View Recycle Bin retention rules

You can view Recycle Bin retention rules using one of the following methods.

Recycle Bin console

To view retention rules

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation pane, choose **Retention rules**.
3. The grid lists all of the retention rules for the selected Region. To view more information about a specific retention rule, select it in the grid.

AWS CLI

To view all of your retention rules

Use the [list-rules](#) AWS CLI command, and for `--resource-type`, specify `EBS_SNAPSHOT` for snapshots or `EC2_IMAGE` for AMIs.

```
C:\> aws rbin list-rules --resource-type EBS_SNAPSHOT|EC2_IMAGE
```

Example

The following example command provides lists all retention rules that retain snapshots.

```
C:\> aws rbin list-rules --resource-type EBS_SNAPSHOT
```

To view information for a specific retention rule

Use the [get-rule](#) AWS CLI command.

```
C:\> aws rbin get-rule --identifier rule_ID
```

Example

The following example command provides information about retention rule `pxwIkFcvge4`.

```
C:\> aws rbin get-rule --identifier pxwIkFcvge4
```

Update retention rules

You can update an unlocked retention rule's description, resource tags, and retention period at any time after creation. You can't update a retention rule's resource type or unlock delay period, even if the retention rule is unlocked.

You can't update a locked retention rule in any way. If you need to modify a locked retention rule, you must first unlock it and wait for the unlock delay period to expire.

If you need to modify the unlock delay period for a locked retention rule, you must [unlock the retention rule](#), and wait for the current unlock delay period to expire. When the unlock delay period is expired, you must [relock the retention rule](#) and specify the new unlock delay period.

Note

We recommend that you do not include personally identifying, confidential, or sensitive information in the retention rule description.

After you update a retention rule, the changes only apply to new resources that it retains. The changes do not affect resources that it previously sent to the Recycle Bin. For example, if you update a retention rule's retention period, only snapshots that are deleted after the update are retained for the new retention period. Snapshots that it sent to the Recycle Bin before the update are still retained for the previous (old) retention period.

You can update a retention rule using one of the following methods.

Recycle Bin console

To update a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation pane, choose **Retention rules**.
3. In the grid, select the retention rule to update, and choose **Actions, Edit retention rule**.
4. In the **Rule details** section, update **Retention rule name** and **Retention rule description** as needed.
5. In the **Rule settings** section, update the **Resource type**, **Resource tags to match**, and **Retention period** as needed.
6. In the **Tags** section, add or remove retention rule tags as needed.
7. Choose **Save retention rule**.

AWS CLI

To update a retention rule

Use the [update-rule](#) AWS CLI command. For **--identifier**, specify the ID of the retention rule to update. For **--resource-types**, specify EBS_SNAPSHOT for snapshots or EC2_IMAGE for AMIs.

```
C:\> aws rbin update-rule \
--identifier rule_ID \
```

```
--retention-period RetentionPeriodValue=number_of_days,RetentionPeriodUnit= DAYS \
--resource-type EBS_SNAPSHOT/EC2_IMAGE \
--description "rule_description"
```

Example

The following example command updates retention rule 6lsJ2Fa9nh9 to retain all snapshots for 7 days and updates its description.

```
C:\> aws rbin update-rule \
--identifier 6lsJ2Fa9nh9 \
--retention-period RetentionPeriodValue=7,RetentionPeriodUnit= DAYS \
--resource-type EBS_SNAPSHOT \
--description "Retain for three weeks"
```

Lock retention rules

Recycle Bin lets you lock Region-level retention rules at any time.

Note

You can't lock tag-level retention rules.

A locked retention rule can't be modified or deleted, even by users who have the required IAM permissions. Lock your retention rules to help protect them against accidental or malicious modifications and deletions.

When you lock a retention rule, you must specify an unlock delay period. This is the period of time that you must wait after unlocking the retention rule before you can modify or delete it. You cannot modify or delete the retention rule during the unlock delay period. You can modify or delete the retention rule only after the unlock delay period has expired.

You can't change the unlock delay period after the retention rule has been locked. If your account permissions have been compromised, the unlock delay period gives you additional time to detect and respond to security threats. The length of this period should be longer than the time it takes for you to identify and respond to security breaches. To set the right duration, you can review previous security incidents and the time needed to identify and remediate an account breach.

We recommend that you use Amazon EventBridge rules to notify you of retention rule lock state changes. For more information, see [Monitor Recycle Bin using Amazon EventBridge](#).

Considerations

- You can lock Region-level retention rules only.
- You can lock an unlocked retention rule at any time.
- The unlock delay period must be 7 to 30 days.
- You can re-lock a retention rule during the unlock delay period. Relocking the retention rule resets the unlock delay period.

You can lock a Region-level retention rule using one of the following methods.

Recycle Bin console

To lock a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation panel, choose **Retention rules**.
3. In the grid, select the unlocked retention rule to lock, and choose **Actions**, **Edit retention rule lock**.
4. In the Edit retention rule lock screen, choose **Lock**, and then for **Unlock delay period**, specify the unlock delay period in days.
5. Select the **I acknowledge that locking the retention rule will prevent it from being modified or deleted** check box, and then choose **Save**.

AWS CLI

To lock an unlocked retention rule

Use the [lock-rule](#) AWS CLI command. For `--identifier`, specify the ID of the retention rule to lock. For `--lock-configuration`, specify the unlock delay period in days.

```
C:\> aws rbin lock-rule \
--identifier rule_ID \
--lock-configuration
'UnlockDelay={UnlockDelayUnit=DAY,UnlockDelayValue=number_of_days}'
```

Example

The following example command locks retention rule 61sJ2Fa9nh9 and sets the unlock delay period to 15 days.

```
C:\> aws rbin lock-rule \
--identifier 61sJ2Fa9nh9 \
--lock-configuration 'UnlockDelay={UnlockDelayUnit=DAY,UnlockDelayValue=15}'
```

Unlock retention rules

You can't modify or delete a locked retention rule. If you need to modify a locked retention rule, you must first unlock it. After you have unlocked the retention rule, you must wait for the unlock delay period to expire before you modify or delete it. You can't modify or delete a retention rule during the unlock delay period.

An unlocked retention rule can be modified and deleted at any time by a user who has the required IAM permissions. Leaving your retention rules unlocked could expose them to accidental or malicious modifications and deletions.

Considerations

- You can re-lock a retention rule during the unlock delay period.
- You can re-lock a retention rule after the unlock delay period has expired.
- You can't bypass the unlock delay period.
- You can't change the unlock delay period after the initial lock.

We recommend that you use Amazon EventBridge rules to notify you of retention rule lock state changes. For more information, see [Monitor Recycle Bin using Amazon EventBridge](#).

You can unlock a locked Region-level retention rule using one of the following methods.

Recycle Bin console

To unlock a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation panel, choose **Retention rules**.

3. In the grid, select the locked retention rule to unlock, and choose **Actions, Edit retention rule lock**.
4. On the Edit retention rule lock screen, choose **Unlock**, and then choose **Save**.

AWS CLI

To unlock a locked retention rule

Use the [unlock-rule](#) AWS CLI command. For **--identifier**, specify the ID of the retention rule to unlock.

```
C:\> aws rbin unlock-rule \
--identifier rule_ID
```

Example

The following example command unlocks retention rule 6lsJ2Fa9nh9

```
C:\> aws rbin unlock-rule \
--identifier 6lsJ2Fa9nh9
```

Tag retention rules

You can assign custom tags to your retention rules to categorize them in different ways, for example, by purpose, owner, or environment. This helps you to efficiently find a specific retention rule based on the custom tags that you assigned.

You can assign a tag to a retention rule using one of the following methods.

Recycle Bin console

To tag a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation pane, choose **Retention rules**.
3. Select the retention rule to tag, choose the **Tags** tab, and then choose **Manage tags**.
4. Choose **Add tag**. For **Key**, enter the tag key. For **Value**, enter the tag value.
5. Choose **Save**.

AWS CLI

To tag a retention rule

Use the [tag-resource](#) AWS CLI command. For `--resource-arn`, specify the Amazon Resource Name (ARN) of the retention rule to tag, and for `--tags`, specify the tag key and value pair.

```
C:\> aws rbin tag-resource \
--resource-arn retention_rule_arn \
--tags key=tag_key,value=tag_value
```

Example

The following example command tags retention rule `arn:aws:rbin:us-east-1:123456789012:rule/n0oSBBtItF3` with tag `purpose=production`.

```
C:\> aws rbin tag-resource \
--resource-arn arn:aws:rbin:us-east-1:123456789012:rule/n0oSBBtItF3 \
--tags key=purpose,value=production
```

View retention rule tags

You can view the tags assigned to a retention rule using one of the following methods.

Recycle Bin console

To view tags for a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation pane, choose **Retention rules**.
3. Select the retention rule for which to view the tags, and choose the **Tags** tab.

AWS CLI

To view the tags assigned to a retention rule

Use the [list-tags-for-resource](#) AWS CLI command. For `--resource-arn`, specify the ARN of the retention rule.

```
C:\> aws rbin list-tags-for-resource \
--resource-arn retention_rule_arn
```

Example

The following example command lists the tags for retention rule arn:aws:rbin:us-east-1:123456789012:rule/n0oSBBtItF3.

```
C:\> aws rbin list-tags-for-resource \
--resource-arn arn:aws:rbin:us-east-1:123456789012:rule/n0oSBBtItF3
```

Remove tags from retention rules

You can remove tags from a retention rule using one of the following methods.

Recycle Bin console

To remove a tag from a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation pane, choose **Retention rules**.
3. Select the retention rule from which to remove the tag, choose the **Tags** tab, and then choose **Manage tags**.
4. Choose **Remove** next to the tag to remove.
5. Choose **Save**.

AWS CLI

To remove a tag from a retention rule

Use the [untag-resource](#) AWS CLI command. For **--resource-arn**, specify the ARN of the retention rule. For **--tagkeys**, specify the tags keys of the tags to remove.

```
C:\> aws rbin untag-resource \
--resource-arn retention_rule_arn \
--tagkeys tag_key
```

Example

The following example command removes tags that have a tag key of purpose from retention rule arn:aws:rbin:us-east-1:123456789012:rule/n0oSBBtItF3.

```
C:\> aws rbin untag-resource \
--resource-arn arn:aws:rbin:us-east-1:123456789012:rule/n0oSBBtItF3 \
--tagkeys purpose
```

Delete Recycle Bin retention rules

You can delete a retention rule at any time. When you delete a retention rule, it no longer retains new resources in the Recycle Bin after they have been deleted. Resources that were sent to the Recycle Bin before the retention rule was deleted continue to be retained in the Recycle Bin according to the retention period defined in the retention rule. When the period expires, the resource is permanently deleted from the Recycle Bin.

You can delete a retention rule using one of the following methods.

Recycle Bin console

To delete a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation pane, choose **Retention rules**.
3. In the grid, select the retention rule to delete, and choose **Actions, Delete retention rule**.
4. When prompted, enter the confirmation message and choose **Delete retention rule**.

AWS CLI

To delete a retention rule

Use the [delete-rule](#) AWS CLI command. For **--identifier**, specify the ID of the retention rule to delete.

```
C:\> aws rbin delete-rule --identifier rule_ID
```

Example

The following example command deletes retention rule 6lsJ2Fa9nh9.

```
C:\> aws rbin delete-rule --identifier 6lsJ2Fa9nh9
```

Work with resources in the Recycle Bin

Recycle Bin supports the following resource types:

- Amazon EBS snapshots
- Amazon EBS-backed Amazon Machine Images (AMIs)

Tasks

- [Recover snapshots from the Recycle Bin](#)
- [Recover AMIs from the Recycle Bin](#)

Recover snapshots from the Recycle Bin

Recycle Bin is a data recovery feature that enables you to restore accidentally deleted Amazon EBS snapshots and EBS-backed AMIs. When using Recycle Bin, if your resources are deleted, they are retained in the Recycle Bin for a time period that you specify before being permanently deleted.

You can restore a resource from the Recycle Bin at any time before its retention period expires. After you restore a resource from the Recycle Bin, the resource is removed from the Recycle Bin and you can use it in the same way that you use any other resource of that type in your account. If the retention period expires and the resource is not restored, the resource is permanently deleted from the Recycle Bin and it is no longer available for recovery.

Snapshots in the Recycle Bin are billed at the same rate as regular snapshots in your account. There are no additional charges for using Recycle Bin and retention rules. For more information, see [Amazon EBS pricing](#).

For more information, see [Recycle Bin](#).

Topics

- [Permissions for working with snapshots in the Recycle Bin](#)
- [View snapshots in the Recycle Bin](#)

- [Restore snapshots from the Recycle Bin](#)

Permissions for working with snapshots in the Recycle Bin

By default, users don't have permission to work with snapshots that are in the Recycle Bin. To allow users to work with these resources, you must create IAM policies that grant permission to use specific resources and API actions. Once the policies are created, you must add permissions to your users, groups, or roles.

To view and recover snapshots that are in the Recycle Bin, users must have the following permissions:

- ec2:ListSnapshotsInRecycleBin
- ec2:RestoreSnapshotFromRecycleBin

To manage tags for snapshots in the Recycle Bin, users need the following additional permissions.

- ec2:CreateTags
- ec2:DeleteTags

To use the Recycle Bin console, users need the ec2:DescribeTags permission.

The following is an example IAM policy. It includes the ec2:DescribeTags permission for console users, and it includes the ec2:CreateTags and ec2:DeleteTags permissions for managing tags. If the permissions are not needed, you can remove them from the policy.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2>ListSnapshotsInRecycleBin",  
                "ec2>RestoreSnapshotFromRecycleBin"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2>DescribeTags",  
            "Resource": "*"  
        }  
    ]  
}
```

```
        "Action": [
            "ec2:CreateTags",
            "ec2>DeleteTags",
            "ec2:DescribeTags"
        ],
        "Resource": "arn:aws:ec2:Region:account-id:snapshot/*"
    },
}

]
```

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center User Guide*.

- Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.

- IAM users:

- Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.
- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

For more information about the permissions needed to use Recycle Bin, see [Permissions for working with Recycle Bin and retention rules](#).

View snapshots in the Recycle Bin

While a snapshot is in the Recycle Bin, you can view limited information about it, including:

- The ID of the snapshot.
- The snapshot description.
- The ID of the volume from which the snapshot was created.
- The date and time when the snapshot was deleted and it entered Recycle Bin.

- The date and time when the retention period expires. The snapshot will be permanently deleted from the Recycle Bin at this time.

You can view the snapshots in the Recycle Bin using one of the following methods.

Recycle Bin console

To view snapshots in the Recycle Bin using the console

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation pane, choose **Recycle Bin**.
3. The grid lists all of the snapshots that are currently in the Recycle Bin. To view the details for a specific snapshot, select it in the grid and choose **Actions, View details**.

AWS CLI

To view snapshots in the Recycle Bin using the AWS CLI

Use the [list-snapshots-in-recycle-bin](#) AWS CLI command. Include the --snapshot-id option to view a specific snapshot. Or omit the --snapshot-id option to view all snapshots in the Recycle Bin.

```
C:\> aws ec2 list-snapshots-in-recycle-bin --snapshot-id snapshot_id
```

For example, the following command provides information about snapshot snap-01234567890abcdef in the Recycle Bin.

```
C:\> aws ec2 list-snapshots-in-recycle-bin --snapshot-id snap-01234567890abcdef
```

Example output:

```
{  
  "SnapshotRecycleBinInfo": [  
    {  
      "Description": "Monthly data backup snapshot",  
      "RecycleBinEnterTime": "2021-12-01T13:00:00.000Z",  
      "RecycleBinExitTime": "2021-12-15T13:00:00.000Z",  
      "VolumeId": "vol-abcdef09876543210",  
      "VolumeSize": 100  
    }  
  ]  
}
```

```
        "SnapshotId": "snap-01234567890abcdef"
    }
}
```

Restore snapshots from the Recycle Bin

You can't use a snapshot in any way while it is in the Recycle Bin. To use the snapshot, you must first restore it. When you restore a snapshot from the Recycle Bin, the snapshot is immediately available for use, and it is removed from the Recycle Bin. You can use a restored snapshot in the same way that you use any other snapshot in your account.

You can restore a snapshot from the Recycle Bin using one of the following methods.

Recycle Bin console

To restore a snapshot from the Recycle Bin using the console

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation pane, choose **Recycle Bin**.
3. The grid lists all of the snapshots that are currently in the Recycle Bin. Select the snapshot to restore and choose **Recover**.
4. When prompted, choose **Recover**.

AWS CLI

To restore a deleted snapshot from the Recycle Bin using the AWS CLI

Use the [restore-snapshot-from-recycle-bin](#) AWS CLI command. For `--snapshot-id`, specify the ID of the snapshot to restore.

```
C:\> aws ec2 restore-snapshot-from-recycle-bin --snapshot-id snapshot_id
```

For example, the following command restores snapshot snap-01234567890abcdef from the Recycle Bin.

```
C:\> aws ec2 restore-snapshot-from-recycle-bin --snapshot-id snap-01234567890abcdef
```

Example output:

```
{  
    "SnapshotId": "snap-01234567890abcdef",  
    "Description": "Monthly data backup snapshot",  
    "Encrypted": false,  
    "OwnerId": "111122223333",  
    "Progress": "100%",  
    "StartTime": "2021-12-01T13:00:00.000000+00:00",  
    "State": "recovering",  
    "VolumeId": "vol-ffffffff",  
    "VolumeSize": 30  
}
```

Recover AMIs from the Recycle Bin

Recycle Bin is a data recovery feature that enables you to restore accidentally deleted Amazon EBS snapshots and EBS-backed AMIs. When using Recycle Bin, if your resources are deleted, they are retained in the Recycle Bin for a time period that you specify before being permanently deleted.

You can restore a resource from the Recycle Bin at any time before its retention period expires. After you restore a resource from the Recycle Bin, the resource is removed from the Recycle Bin and you can use it in the same way that you use any other resource of that type in your account. If the retention period expires and the resource is not restored, the resource is permanently deleted from the Recycle Bin and it is no longer available for recovery.

AMIs in the Recycle Bin do not incur any additional charges.

For more information, see [Recycle Bin](#).

Topics

- [Permissions for working with AMIs in the Recycle Bin](#)
- [View AMIs in the Recycle Bin](#)
- [Restore AMIs from the Recycle Bin](#)

Permissions for working with AMIs in the Recycle Bin

By default, users don't have permission to work with AMIs that are in the Recycle Bin. To allow users to work with these resources, you must create IAM policies that grant permission to use

specific resources and API actions. Once the policies are created, you must add permissions to your users, groups, or roles.

To view and recover AMIs that are in the Recycle Bin, users must have the following permissions:

- `ec2>ListImagesInRecycleBin`
- `ec2:RestoreImageFromRecycleBin`

To manage tags for AMIs in the Recycle Bin, users need the following additional permissions.

- `ec2>CreateTags`
- `ec2>DeleteTags`

To use the Recycle Bin console, users need the `ec2:DescribeTags` permission.

The following is an example IAM policy. It includes the `ec2:DescribeTags` permission for console users, and it includes the `ec2:CreateTags` and `ec2>DeleteTags` permissions for managing tags. If the permissions are not needed, you can remove them from the policy.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2>ListImagesInRecycleBin",  
                "ec2:RestoreImageFromRecycleBin"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2>CreateTags",  
                "ec2>DeleteTags",  
                "ec2:DescribeTags"  
            ],  
            "Resource": "arn:aws:ec2:Region::image/*"  
        }  
    ]  
}
```

{}

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center User Guide*.

- Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.

- IAM users:

- Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.
- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

For more information about the permissions needed to use Recycle Bin, see [Permissions for working with Recycle Bin and retention rules](#).

View AMIs in the Recycle Bin

While an AMI is in the Recycle Bin, you can view limited information about it, including:

- The name, description, and unique ID of the AMI.
- The date and time when the AMI was deleted and it entered Recycle Bin.
- The date and time when the retention period expires. The AMI will be permanently deleted at this time.

You can view the AMIs in the Recycle Bin using one of the following methods.

Recycle Bin console

To view deleted AMIs in the Recycle Bin using the console

1. Open the Recycle Bin console at console.aws.amazon.com/rbin/home/.
2. In the navigation pane, choose **Recycle Bin**.

3. The grid lists all of the resources that are currently in the Recycle Bin. To view the details for a specific AMI, select it in the grid, and choose **Actions, View details**.

AWS CLI

To view deleted AMIs in the Recycle Bin using the AWS CLI

Use the [list-images-in-recycle-bin](#) AWS CLI command. To view specific AMIs, include the --image-id option and specify the IDs of the AMIs to view. You can specify up to 20 IDs in a single request.

To view all of the AMIs in the Recycle Bin, omit the --image-id option. If you do not specify a value for --max-items, the command returns 1,000 items per page, by default. For more information, see [Pagination in the Amazon EC2 API Reference](#).

```
C:\> aws ec2 list-images-in-recycle-bin --image-id ami_id
```

For example, the following command provides information about AMI ami-01234567890abcdef in the Recycle Bin.

```
C:\> aws ec2 list-images-in-recycle-bin --image-id ami-01234567890abcdef
```

Example output:

```
{  
  "Images": [  
    {  
      "ImageId": "ami-0f740206c743d75df",  
      "Name": "My AL2 AMI",  
      "Description": "My Amazon Linux 2 AMI",  
      "RecycleBinEnterTime": "2021-11-26T21:04:50+00:00",  
      "RecycleBinExitTime": "2022-03-06T21:04:50+00:00"  
    }  
  ]  
}
```

Important

If you receive the following error, you might need to update your AWS CLI version. For more information, see [Command not found errors](#).

```
aws.exe: error: argument operation: Invalid choice, valid choices are: ...
```

Restore AMIs from the Recycle Bin

You can't use an AMI in any way while it is in the Recycle Bin. To use the AMI, you must first restore it. When you restore an AMI from the Recycle Bin, the AMI is immediately available for use, and it is removed from the Recycle Bin. You can use a restored AMI in the same way that you use any other AMI in your account.

You can restore an AMI from the Recycle Bin using one of the following methods.

Recycle Bin console

To restore an AMI from the Recycle Bin using the console

1. Open the Recycle Bin console at console.aws.amazon.com/rbin/home/.
2. In the navigation pane, choose **Recycle Bin**.
3. The grid lists all of the resources that are currently in the Recycle Bin. Select the AMI to restore, and choose **Recover**.
4. When prompted, choose **Recover**.

AWS CLI

To restore a deleted AMI from the Recycle Bin using the AWS CLI

Use the [restore-image-from-recycle-bin](#) AWS CLI command. For `--image-id`, specify the ID of the AMI to restore.

```
C:\> aws ec2 restore-image-from-recycle-bin --image-id ami_id
```

For example, the following command restores AMI `ami-01234567890abcdef` from the Recycle Bin.

```
C:\> aws ec2 restore-image-from-recycle-bin --image-id ami-01234567890abcdef
```

The command returns no output on success.

⚠ Important

If you receive the following error, you might need to update your AWS CLI version. For more information, see [Command not found errors](#).

```
aws.exe: error: argument operation: Invalid choice, valid choices are: ...
```

Monitor Recycle Bin

You can use the following features to monitor the Recycle Bin.

Topics

- [Monitor Recycle Bin using Amazon EventBridge](#)
- [Monitor Recycle Bin using AWS CloudTrail](#)

Monitor Recycle Bin using Amazon EventBridge

Recycle Bin sends events to Amazon EventBridge for actions performed on retention rules. With EventBridge, you can establish rules that initiate programmatic actions in response to these events. For example, you can create a EventBridge rule that sends a notification to your email when a retention rule is unlocked and it enters its unlock delay period. For more information, see [Creating Amazon EventBridge rules that react to events](#).

Events in EventBridge are represented as JSON objects. The fields that are unique to the event are contained in the `detail` section of the JSON object. The `event` field contains the event name. The `result` field contains the completed status of the action that initiated the event. For more information, see [Amazon EventBridge event patterns](#) in the *Amazon EventBridge User Guide*.

For more information about Amazon EventBridge, see [What Is Amazon EventBridge?](#) in the *Amazon EventBridge User Guide*.

Events

- [RuleLocked](#)
- [RuleChangeAttempted](#)
- [RuleUnlockScheduled](#)

- [RuleUnlockingNotice](#)
- [RuleUnlocked](#)

RuleLocked

The following is an example of an event that Recycle Bin generates when a retention rule is successfully locked. This event can be generated by **CreateRule** and **LockRule** requests. The API that generated the event is noted in the `api-name` field.

```
{  
  "version": "0",  
  "id": "exampleb-b491-4cf7-a9f1-bf370example",  
  "detail-type": "Recycle Bin Rule Locked",  
  "source": "aws.rbin",  
  "account": "123456789012",  
  "time": "2022-08-10T16:37:50Z",  
  "region": "us-west-2",  
  "resources": [  
    "arn:aws:rbin:us-west-2:123456789012:rule/a12345abcde"  
  ],  
  "detail":  
  {  
    "detail-version": " 1.0.0",  
    "rule-id": "a12345abcde",  
    "rule-description": "locked account level rule",  
    "unlock-delay-period": "30 days",  
    "api-name": "CreateRule"  
  }  
}
```

RuleChangeAttempted

The following is an example of an event that Recycle Bin generates for unsuccessful attempts to modify or delete a locked rule. This event can be generated by **DeleteRule** and **UpdateRule** requests. The API that generated the event is noted in the `api-name` field.

```
{  
  "version": "0",  
  "id": "exampleb-b491-4cf7-a9f1-bf370example",  
  "detail-type": "Recycle Bin Rule Change Attempted",  
  "source": "aws.rbin",  
  "account": "123456789012",  
  "time": "2022-08-10T16:37:50Z",  
  "region": "us-west-2",  
  "resources": [  
    "arn:aws:rbin:us-west-2:123456789012:rule/a12345abcde"  
  ]  
}
```

```
"account": "123456789012",
"time": "2022-08-10T16:37:50Z",
"region": "us-west-2",
"resources": [
    "arn:aws:rbin:us-west-2:123456789012:rule/a12345abcde"
],
"detail":
{
    "detail-version": " 1.0.0",
    "rule-id": "a12345abcde",
    "rule-description": "locked account level rule",
    "unlock-delay-period": "30 days",
    "api-name": "DeleteRule"
}
}
```

RuleUnlockScheduled

The following is an example of an event that Recycle Bin generates when a retention rule is unlocked and it starts its unlock delay period.

```
{
    "version": "0",
    "id": "exampleb-b491-4cf7-a9f1-bf370example",
    "detail-type": "Recycle Bin Rule Unlock Scheduled",

```

RuleUnlockingNotice

The following is an example of an event that Recycle Bin generates daily while a retention rule is in its unlock delay period, until the day before the unlock delay period expires.

```
{  
  "version": "0",  
  "id": "exampleb-b491-4cf7-a9f1-bf370example",

    "scheduled-unlock-time": "2022-09-10T16:37:50Z"  
}  
}
```

Monitor Recycle Bin using AWS CloudTrail

The Recycle Bin service is integrated with AWS CloudTrail. CloudTrail is a service that provides a record of actions taken by a user, role, or an AWS service. CloudTrail captures all API calls performed in Recycle Bin as events. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon Simple Storage Service (Amazon S3) bucket. If you don't configure a trail, you can still view the most recent management events in the CloudTrail console in **Event history**. You can use the information collected by CloudTrail to determine the request that was made to Recycle Bin, the IP address from which the request was made, who made the request, when it was made, and additional details.

For more information about CloudTrail, see the [AWS CloudTrail User Guide](#).

Recycle Bin information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When supported event activity occurs in Recycle Bin, that activity is recorded in a CloudTrail event along with other AWS service events in **Event history**. You can view, search, and download recent events in your AWS account. For more information, see [Viewing Events with CloudTrail Event History](#).

For an ongoing record of events in your AWS account, including events for Recycle Bin, create a trail. A *trail* enables CloudTrail to deliver log files to an S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see [Overview for creating a trail](#) in the [AWS CloudTrail User Guide](#).

Supported API actions

For Recycle Bin, you can use CloudTrail to log the following API actions as *management events*.

- CreateRule

- [UpdateRule](#)
- [GetRules](#)
- [ListRule](#)
- [DeleteRule](#)
- [TagResource](#)
- [UntagResource](#)
- [ListTagsForResource](#)
- [LockRule](#)
- [UnlockRule](#)

For more information about logging management events, see [Logging management events for trails](#) in the *CloudTrail User Guide*.

Identity information

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root user or user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the [CloudTrail userIdentityElement](#).

Understand Recycle Bin log file entries

A trail is a configuration that enables delivery of events as log files to an S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so they don't appear in any specific order.

The following are example CloudTrail log entries.

Resource locations

Amazon EC2 resources are specific to the AWS Region or Availability Zone in which they reside.

Resource	Type	Description
Amazon EC2 resource identifiers	Regional	Each resource identifier, such as an AMI ID, instance ID, EBS volume ID, or EBS snapshot ID, is tied to its Region and can be used only in the Region where you created the resource.
User-supplied resource names	Regional	Each resource name, such as a security group name or key pair name, is tied to its Region and can be used only in the Region where you created the resource. Although you can create resources with the same name in multiple Regions, they aren't related to each other.
AMIs	Regional	An AMI is tied to the Region where its files are located within Amazon S3. You can copy an AMI from one Region to another. For more information, see Copy an AMI .
EBS snapshots	Regional	An EBS snapshot is tied to its Region and can only be used to create volumes in the same Region. You can copy a snapshot from one Region to another.
EBS volumes	Availability Zone	An Amazon EBS volume is tied to its Availability Zone and can be attached only to instances in the same Availability Zone.
Elastic IP addresses	Regional	An Elastic IP address is tied to a Region and can be associated only with an instance in the same Region.

Resource	Type	Description
Instances	Availability Zone	An instance is tied to the Availability Zones in which you launched it. However, its instance ID is tied to the Region.
Key pairs	Global or Regional	<p>The key pairs that you create using Amazon EC2 are tied to the Region where you created them. You can create your own RSA key pair and upload it to the Region in which you want to use it; therefore, you can make your key pair globally available by uploading it to each Region.</p> <p>For more information, see Amazon EC2 key pairs and Amazon EC2 instances.</p>
Security groups	Regional	A security group is tied to a Region and can be assigned only to instances in the same Region. You can't enable an instance to communicate with an instance outside its Region using security group rules. Traffic from an instance in another Region is seen as WAN bandwidth.

Resource IDs

When resources are created, we assign each resource a unique resource ID. A resource ID takes the form of a resource identifier (such as snap for a snapshot) followed by a hyphen and a unique combination of letters and numbers.

Each resource identifier, such as an AMI ID, instance ID, EBS volume ID, or EBS snapshot ID, is tied to its Region and can be used only in the Region where you created the resource.

You can use resource IDs to find your resources in the Amazon EC2 console. If you are using a command line tool or the Amazon EC2 API to work with Amazon EC2, resource IDs are required for certain commands. For example, if you are using the [stop-instances](#) AWS CLI command to stop an instance, you must specify the instance ID in the command.

Resource ID length

Prior to January 2016, the IDs assigned to newly created resources of certain resource types used 8 characters after the hyphen (for example, i-1a2b3c4d). From January 2016 to June 2018, we changed the IDs of these resource types to use 17 characters after the hyphen (for example, i-1234567890abcdef0). Depending on when your account was created, you might have some existing resources with short IDs, however, any new resources will receive the longer IDs.

List and filter your resources

You can get a list of some types of resources using the Amazon EC2 console. You can get a list of each type of resource using its corresponding command or API action. If you have many resources, you can filter the results to include, or exclude, only the resources that match certain criteria.

List and filter resources using the console

Contents

- [List resources using the console](#)
- [Filter resources using the console](#)
 - [Supported filters](#)

List resources using the console

You can view the most common Amazon EC2 resource types using the console. To view additional resources, use the command line interface or the API actions.

To list EC2 resources using the console

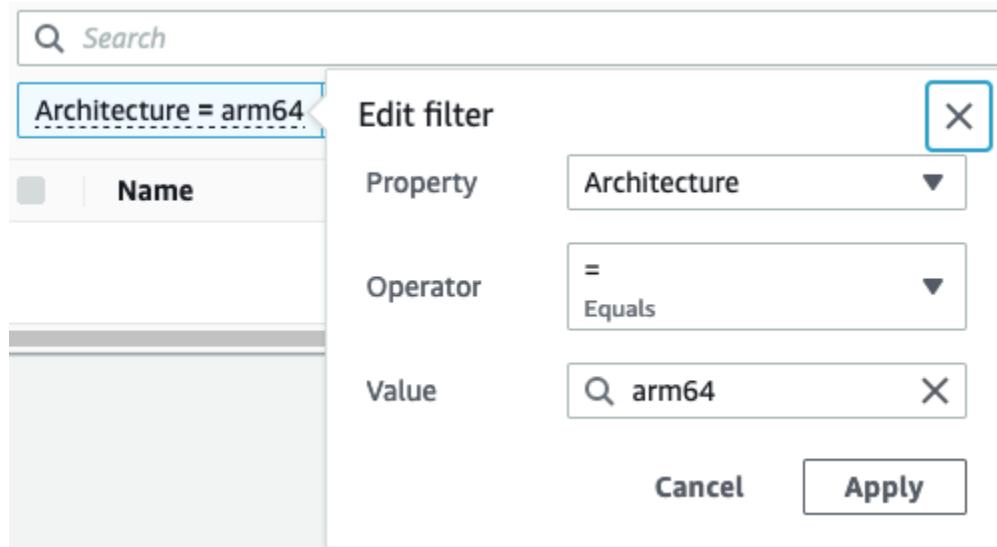

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose the option that corresponds to the resource type. For example, to list your instances, choose **Instances**.

The page displays all resources of the selected resource type.

Filter resources using the console

To filter a list of resources

1. In the navigation pane, select a resource type (for example, **Instances**).
2. Choose the search field.
3. Select the filter from the list.
4. Select an operator, for example, **= (Equals)**. Some attributes have more available operators to select. Note that not all screens support selecting an operator.
5. Select a filter value.
6. To edit a selected filter, choose the filter token (blue box), make the required edits, and then choose **Apply**. Note that not all screens support editing the selected filter.

7. When you are finished, remove the filter.

Supported filters

The Amazon EC2 console supports two types of filtering.

- *API filtering* happens on the server side. The filtering is applied on the API call, which reduces the number of resources returned by the server. It allows for quick filtering across large sets of

resources, and it can reduce data transfer time and cost between the server and the browser. API filtering supports = (equals) and : (contains) operators, and is always case sensitive.

- *Client filtering* happens on the client side. It enables you to filter down on data that is already available in the browser (in other words, data that has already been returned by the API). Client filtering works well in conjunction with an API filter to filter down to smaller data sets in the browser. In addition to = (equals) and : (contains) operators, client filtering can also support range operators, such as >= (greater than or equal), and negation (inverse) operators, such as != (does not equal).

The Amazon EC2 console supports the following types of searches:

Search by keyword

Searching by keyword is a free text search that lets you search for a value across all of your resources' attributes or tags, without specifying an attribute or tag key to search.

 **Note**

All keyword searches use *client filtering*.

To search by keyword, enter or paste what you're looking for in the search field, and then choose **Enter**. For example, searching for 123 matches all instances that have 123 in any of their attributes, such as an IP address, instance ID, VPC ID, or AMI ID, or in any of their tags, such as the Name. If your free text search returns unexpected matches, apply additional filters.

Search by attribute

Searching by an attribute lets you search a specific attribute across all of your resources.

 **Note**

Attribute searches use either *API filtering* or *client filtering*, depending on the selected attribute. When performing an attribute search, the attributes are grouped accordingly.

For example, you can search the **Instance state** attribute for all of your instances to return only instances that are in the stopped state. To do this:

1. In the search field on the **Instances** screen, start entering Instance state. As you enter the characters, the two types of filters appear for **Instance state**: **API filters** and **Client filters**.
2. To search on the server side, choose **Instance state** under **API filters**. To search on the client side, choose **Instance state (client)** under **Client filters**.

A list of possible operators for the selected attribute appears.

3. Choose the = (Equals) operator.

A list of possible values for the selected attribute and operator appears.

4. Choose **stopped** from the list.

Search by tag

Searching by a tag lets you filter the resources in the currently displayed table by a tag key or a tag value.

Tag searches use either *API filtering* or *client filtering*, depending on the settings in the Preferences window.

To ensure API filtering for tags

1. Open the **Preferences** window.
2. Clear the **Use regular expression matching** check box. If this check box is selected, client filtering is performed.
3. Select the **Use case sensitive matching** check box. If this check box is cleared, client filtering is performed.
4. Choose **Confirm**.

When searching by tag, you can use the following values:

- **(empty)** – Find all resources with the specified tag key, but there must be no tag value.
- **All values** – Find all resources with the specified tag key and any tag value.
- **Not tagged** – Find all resources that do not have the specified tag key.
- **The displayed value** – Find all resources with the specified tag key and the specified tag value.

You can use the following techniques to enhance or refine your searches:

Inverse search

Inverse searches let you search for resources that do **not** match a specified value. In the **Instances** and **AMIs** screens, inverse searches are performed by selecting the **!=** (Does not equal) or **!: (Does not contain)** operator and then selecting a value. In other screens, inverse searches are performed by prefixing the search keyword with the exclamation mark (!) character.

 **Note**

Inverse search is supported with keyword searches and attribute searches on *client* filters only. It is not supported with attribute searches on API filters.

For example, you can search the **Instance state** attribute for all of your instances to exclude all instances that are in the terminated state. To do this:

1. In the search field on the **Instances** screen, start entering **Instance state**. As you enter the characters, the two types of filters appear for **Instance state: API filters** and **Client filters**.
2. Under **Client filters**, choose **Instance state (client)**. Inverse search is only supported on *client* filters.

A list of possible operators for the selected attribute appears.

3. Choose **!= (Does not equal)**, and then choose **terminated**.

To filter instances based on an instance state attribute, you can also use the search icons (

) in the **Instance state** column. The search icon with a plus sign (+) displays all the instances that *match* that attribute. The search icon with a minus sign (-) *excludes* all instances that match that attribute.

Here is another example of using the inverse search: To list all instances that are **not** assigned the security group named `launch-wizard-1`, under **Client filters**, search by the **Security group name** attribute, choose **!=**, and in the search bar, enter `launch-wizard-1`.

Partial search

With partial searches, you can search for partial string values. To perform a partial search, enter only a part of the keyword that you want to search for. On the **Instances** and **AMIs** screens,

partial searches can only be performed with the : (Contains) operator. On other screens, you can select the client filter attribute and immediately enter only a part of the keyword that you want to search for. For example, on the **Instance type** screen, to search for all t2.micro, t2.small, and t2.medium instances, search by the **Instance Type** attribute, and for the keyword, enter t2.

Regular expression search

To use regular expression searches, you must select the **Use regular expression matching** check box in the Preferences window.

Regular expressions are useful when you need to match the values in a field with a specific pattern. For example, to search for a value that starts with s, search for ^s. To search for a value that ends with xyz, search for xyz\$. Or to search for a value that starts with a number that is followed by one or more characters, search for [0-9]+. *.

 **Note**

Regular expression search is supported with keyword searches and attribute searches on client filters only. It is not supported with attribute searches on API filters.

Case-sensitive search

To use case-sensitive searches, you must select the **Use case sensitive matching** check box in the Preferences window. The case-sensitive preference only applies to client and tag filters.

 **Note**

API filters are always case-sensitive.

Wildcard search

Use the * wildcard to match zero or more characters. Use the ? wildcard to match zero or one character. For example, if you have a data set with the values prod, prods, and production, a search of prod* matches all values, whereas prod? matches only prod and prods. To use the literal values, escape them with a backslash (\). For example, "prod*" would match prod*.

Note

Wildcard search is supported with attribute and tag searches on API filters only. It is not supported with keyword searches, and with attribute and tag searches on client filters.

Combining searches

In general, multiple filters with the same attribute are automatically joined with OR. For example, searching for `Instance State : Running` and `Instance State : Stopped` returns all instances that are either running OR stopped. To join search with AND, search across different attributes. For example, searching for `Instance State : Running` and `Instance Type : c4.large` returns only instances that are of type `c4.large` AND that are in the running state.

List and filter using the CLI and API

Each resource type has a corresponding CLI command and API action that you use to list resources of that type. The resulting lists of resources can be long, so it can be faster and more useful to filter the results to include only the resources that match specific criteria.

Filtering considerations

- You can specify multiple filters and multiple filter values in a single request.
- You can use wildcards with the filter values. An asterisk (*) matches zero or more characters, and a question mark (?) matches zero or one character.
- Filter values are case sensitive.
- Your search can include the literal values of the wildcard characters; you just need to escape them with a backslash before the character. For example, a value of `*amazon\?\\\` searches for the literal string `*amazon?\``.

Supported filters

To see the supported filters for each Amazon EC2 resource, see the following documentation:

- AWS CLI: The describe commands in the [AWS CLI Command Reference-Amazon EC2](#).

- Tools for Windows PowerShell: The Get commands in the [AWS Tools for PowerShell Cmdlet Reference-Amzon EC2](#).
- Query API: The Describe API actions in the [Amazon EC2 API Reference](#).

Example Example: Specify a single filter

You can list your Amazon EC2 instances using [describe-instances](#). Without filters, the response contains information for all of your resources. You can use the following command to include only the running instances in your output.

```
aws ec2 describe-instances --filters Name=instance-state-name,Values=running
```

To list only the instance IDs for your running instances, add the --query parameter as follows.

```
aws ec2 describe-instances --filters Name=instance-state-name,Values=running --query "Reservations[*].Instances[*].InstanceId" --output text
```

The following is example output.

```
i-0ef1f57f78d4775a4  
i-0626d4edd54f1286d  
i-04a636d18e83cfacb
```

Example Example: Specify multiple filters or filter values

If you specify multiple filters or multiple filter values, the resource must match all filters to be included in the results.

You can use the following command to list all instances whose type is either `m5.large` or `m5d.large`.

```
aws ec2 describe-instances --filters Name=instance-type,Values=m5.large,m5d.large
```

You can use the following command to list all stopped instances whose type is `t2.micro`.

```
aws ec2 describe-instances --filters Name=instance-state-name,Values=stopped  
Name=instance-type,Values=t2.micro
```

Example Example: Use wildcards in a filter value

If you specify database as the filter value for the description filter when describing EBS snapshots using [describe-snapshots](#), the command returns only the snapshots whose description is "database".

```
aws ec2 describe-snapshots --filters Name=description,Values=database
```

The * wildcard matches zero or more characters. If you specify *database* as the filter value, the command returns only snapshots whose description includes the word database.

```
aws ec2 describe-snapshots --filters Name=description,Values=*database*
```

The ? wildcard matches exactly 1 character. If you specify database? as the filter value, the command returns only snapshots whose description is "database" or "database" followed by one character.

```
aws ec2 describe-snapshots --filters Name=description,Values=database?
```

If you specify database????, the command returns only snapshots whose description is "database" followed by up to four characters. It excludes descriptions with "database" followed by five or more characters.

```
aws ec2 describe-snapshots --filters Name=description,Values=database????
```

Example Example: Filter based on date

With the AWS CLI, you can use JMESPath to filter results using expressions. For example, the following [describe-snapshots](#) command displays the IDs of all snapshots created by your AWS account (represented by [123456789012](#)) before the specified date (represented by [2020-03-31](#)). If you do not specify the owner, the results include all public snapshots.

```
aws ec2 describe-snapshots --filters Name=owner-id,Values=123456789012 --query "Snapshots[?(StartTime<='2020-03-31')].[SnapshotId]" --output text
```

The following command displays the IDs of all snapshots created in the specified date range.

```
aws ec2 describe-snapshots --filters Name=owner-id,Values=123456789012 --query "Snapshots[?(StartTime>='2019-01-01') && (StartTime<='2019-12-31')].[SnapshotId]" --output text
```

Filter based on tags

For examples of how to filter a list of resources according to their tags, see [Work with tags using the command line](#).

View resources across Regions using Amazon EC2 Global View

Amazon EC2 Global View enables you to view and search for Amazon EC2 and Amazon VPC resources in a single AWS Region, or across multiple Regions simultaneously in a single console. For more information, see [Amazon EC2 Global View](#).

Amazon EC2 Global View

Amazon EC2 Global View enables you to view some of your Amazon EC2 and Amazon VPC resources across a single AWS Region, or across multiple Regions in a single console. Amazon EC2 Global View also provides *global search* functionality that lets you search for specific resources or specific resource types across multiple Regions simultaneously.

Amazon EC2 Global View does not let you modify resources in any way.

Supported resources

Using Amazon EC2 Global View, you can view a global summary of the following resources across all of the Regions for which your AWS account is enabled.

- Auto Scaling groups
- DHCP option set
- Egress-only internet gateways
- Elastic IPs
- Endpoint services
- Instances
- Internet gateways
- Managed prefix lists
- NAT gateways

- Network ACLs
- Network interfaces
- Route tables
- Security groups
- Subnets
- Volumes
- VPCs
- VPC endpoints
- VPC peering connections

Required permissions

A user must have the following permissions to use Amazon EC2 Global View.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "autoscaling:DescribeAutoScalingGroups",  
                "ec2:DescribeRegions",  
                "ec2:DescribeDhcpOptions",  
                "ec2:DescribeEgressOnlyInternetGateways",  
                "ec2:DescribeAddresses",  
                "ec2:DescribeVpcEndpointServices",  
                "ec2:DescribeInstances",  
                "ec2:DescribeInternetGateways",  
                "ec2:DescribePrefixLists",  
                "ec2:DescribeNatGateways",  
                "ec2:DescribeNetworkAcls",  
                "ec2:DescribeNetworkInterfaces",  
                "ec2:DescribeRouteTables",  
                "ec2:DescribeSecurityGroups",  
                "ec2:DescribeSubnets",  
                "ec2:DescribeVolumes",  
                "ec2:DescribeVpcs",  
                "ec2:DescribeVpcEndpoints",  
                "ec2:DescribeVpcPeeringConnections"  
            ]  
        }  
    ]  
}
```

```
],  
"Resource": "*"  
}]  
}
```

To use Amazon EC2 Global View

Open the Amazon EC2 Global View console at <https://console.aws.amazon.com/ec2globalview/home>.

Important

You cannot use a private window in Firefox to access Amazon EC2 Global View.

The console consists of the following:

- **Region explorer**—This tab includes the following sections:
 - **Summary**—Provides a high-level overview of your resources across all Regions.

Enabled Regions indicates the number of Regions for which your AWS account is enabled. The remaining fields indicate the number of resources that you currently have in those Regions. Choose any of the links to view the resources of that type across all Regions. For example, if the link below the **Instances** label is **29 in 10 Regions**, it indicates that you currently have 29 instances across 10 Regions. Choose the link to view a list of all 29 instances.

- **Resource region counts**—Lists all of the AWS Regions (including those for which your account is not enabled) and provides totals for each resource type for each Region.

Choose a Region name to view all resources of all types for that specific Region. For example, choose **Africa (Cape Town) af-south-1** to view all VPCs, subnets, instances, security groups, volumes, and Auto Scaling groups in that Region. Alternatively, select a Region and choose **View resources for selected Region**.

Choose the value for a specific resource type in a specific Region to view only resources of that type in that Region. For example, choose the value for Instances for **Africa (Cape Town) af-south-1** to view only the instances in that Region.

- **Global search**—This tab enables you to search for specific resources or specific resource types across a single Region or across multiple Regions. It also enables you to view details for a specific resource.

To search for resources, enter the search criteria in the field preceding the grid. You can search by Region, by resource type, and by the tags assigned to resources.

To view the details for a specific resource, select it in the grid. You can also choose the resource ID of a resource to open it in its respective console. For example, choose an instance ID to open the instance in the Amazon EC2 console, or choose a subnet ID to open the subnet in the Amazon VPC console.

Tip

If you only use specific Regions or resource types, you can customize Amazon EC2 Global View to display only those Regions and resource types. To customize the displayed Regions and resource types, in the navigation panel, choose **Settings**, and then on the **Resources** and **Regions** tabs, select the Regions and resource types that you do not want to be displayed in Amazon EC2 Global View.

Tag your Amazon EC2 resources

To help you manage your instances, images, and other Amazon EC2 resources, you can assign your own metadata to each resource in the form of *tags*. Tags enable you to categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type—you can quickly identify a specific resource based on the tags that you've assigned to it. This topic describes tags and shows you how to create them.

Warning

Tag keys and their values are returned by many different API calls. Denying access to `DescribeTags` doesn't automatically deny access to tags returned by other APIs. As a best practice, we recommend that you do not include sensitive data in your tags.

Contents

- [Add tags to a resource using CloudFormation](#)

Tag basics

A tag is a label that you assign to an AWS resource. Each tag consists of a *key* and an optional *value*, both of which you define.

Tags enable you to categorize your AWS resources in different ways, for example, by purpose, owner, or environment. For example, you could define a set of tags for your account's Amazon EC2 instances that helps you track each instance's owner and stack level.

The following diagram illustrates how tagging works. In this example, you've assigned two tags to each of your instances—one tag with the key `Owner` and another with the key `Stack`. Each tag also has an associated value.

We recommend that you devise a set of tag keys that meets your needs for each resource type. Using a consistent set of tag keys makes it easier for you to manage your resources. You can search and filter the resources based on the tags you add. For more information about how to implement an effective resource tagging strategy, see the [Tagging Best Practices AWS Whitepaper](#).

Tags don't have any semantic meaning to Amazon EC2 and are interpreted strictly as a string of characters. Also, tags are not automatically assigned to your resources. You can edit tag keys and values, and you can remove tags from a resource at any time. You can set the value of a tag to an empty string, but you can't set the value of a tag to null. If you add a tag that has the same key as an existing tag on that resource, the new value overwrites the old value. If you delete a resource, any tags for the resource are also deleted.

 **Note**

After you delete a resource, its tags might remain visible in the console, API, and CLI output for a short period. These tags will be gradually disassociated from the resource and be permanently deleted.

Tag your resources

You can tag most Amazon EC2 resources that already exist in your account. The following [table](#) lists the resources that support tagging.

If you're using the Amazon EC2 console, you can apply tags to resources by using the **Tags** tab on the relevant resource screen, or you can use the **Tags Editor** in the AWS Resource Groups console. Some resource screens enable you to specify tags for a resource when you create the resource; for example, a tag with a key of Name and a value that you specify. In most cases, the console applies the tags immediately after the resource is created (rather than during resource creation). The console might organize resources according to the Name tag, but this tag doesn't have any semantic meaning to the Amazon EC2 service.

If you're using the Amazon EC2 API, the AWS CLI, or an AWS SDK, you can use the `CreateTags` EC2 API action to apply tags to existing resources. Additionally, some resource-creating actions enable you to specify tags for a resource when the resource is created. If tags cannot be applied during resource creation, we roll back the resource creation process. This ensures that resources are either created with tags or not created at all, and that no resources are left untagged at any time. By tagging resources at the time of creation, you can eliminate the need to run custom tagging scripts after resource creation. For more information about enabling users to tag resources on creation, see [Grant permission to tag resources during creation](#).

The following table describes the Amazon EC2 resources that can be tagged, and the resources that can be tagged on creation using the Amazon EC2 API, the AWS CLI, or an AWS SDK.

Tagging support for Amazon EC2 resources

Resource	Supports tags	Supports tagging on creation
AFI	Yes	Yes
AMI	Yes	Yes
Bundle task	No	No
Capacity Reservation	Yes	Yes
Carrier gateway	Yes	Yes
Client VPN endpoint	Yes	Yes
Client VPN route	No	No
Customer gateway	Yes	Yes
Dedicated Host	Yes	Yes
Dedicated Host Reservation	Yes	Yes
DHCP options	Yes	Yes
EBS snapshot	Yes	Yes
EBS volume	Yes	Yes
EC2 Fleet	Yes	Yes
Egress-only internet gateway	Yes	Yes
Elastic IP address	Yes	Yes
Elastic Graphics accelerator	Yes	No
Instance	Yes	Yes
Instance event window	Yes	Yes

Resource	Supports tags	Supports tagging on creation
Instance store volume	N/A	N/A
Internet gateway	Yes	Yes
IP address pool (BYOIP)	Yes	Yes
Key pair	Yes	Yes
Launch template	Yes	Yes
Launch template version	No	No
Local gateway	Yes	No
Local gateway route table	Yes	No
Local gateway virtual interface	Yes	No
Local gateway virtual interface group	Yes	No
Local gateway route table VPC association	Yes	Yes
Local gateway route table virtual interface group association	Yes	No
NAT gateway	Yes	Yes
Network ACL	Yes	Yes
Network interface	Yes	Yes
Placement group	Yes	Yes
Prefix list	Yes	Yes

Resource	Supports tags	Supports tagging on creation
Reserved Instance	Yes	No
Reserved Instance listing	No	No
Route table	Yes	Yes
Spot Fleet request	Yes	Yes
Spot Instance request	Yes	Yes
Security group	Yes	Yes
Security group rule	Yes	No
Subnet	Yes	Yes
Traffic Mirror filter	Yes	Yes
Traffic Mirror session	Yes	Yes
Traffic Mirror target	Yes	Yes
Transit gateway	Yes	Yes
Transit gateway multicast domain	Yes	Yes
Transit gateway route table	Yes	Yes
Transit gateway VPC attachment	Yes	Yes
Virtual private gateway	Yes	Yes
VPC	Yes	Yes
VPC endpoint	Yes	Yes
VPC endpoint service	Yes	Yes

Resource	Supports tags	Supports tagging on creation
VPC endpoint service configuration	Yes	Yes
VPC flow log	Yes	Yes
VPC peering connection	Yes	Yes
VPN connection	Yes	Yes

You can tag instances, volumes, elastic graphics, network interfaces, and Spot Instance requests on creation using the Amazon EC2 [launch instance wizard](#) in the Amazon EC2 console. You can tag your EBS volumes on creation using the **Volumes** screen, or EBS snapshots using the **Snapshots** screen. Alternatively, use the resource-creating Amazon EC2 APIs (for example, [RunInstances](#)) to apply tags when creating your resource.

You can apply tag-based resource-level permissions in your IAM policies to the Amazon EC2 API actions that support tagging on creation to implement granular control over the users and groups that can tag resources on creation. Your resources are properly secured from creation—tags are applied immediately to your resources, therefore any tag-based resource-level permissions controlling the use of resources are immediately effective. Your resources can be tracked and reported on more accurately. You can enforce the use of tagging on new resources, and control which tag keys and values are set on your resources.

You can also apply resource-level permissions to the `CreateTags` and `DeleteTags` Amazon EC2 API actions in your IAM policies to control which tag keys and values are set on your existing resources. For more information, see [Example: Tag resources](#).

For more information about tagging your resources for billing, see [Using cost allocation tags](#) in the *AWS Billing User Guide*.

Tag restrictions

The following basic restrictions apply to tags:

- Maximum number of tags per resource – 50
- For each resource, each tag key must be unique, and each tag key can have only one value.

- Maximum key length – 128 Unicode characters in UTF-8
- Maximum value length – 256 Unicode characters in UTF-8
- Allowed characters
 - Although EC2 allows for any character in its tags, other AWS services are more restrictive. The allowed characters across all AWS services are: letters (a-z, A-Z), numbers (0-9), and spaces representable in UTF-8, and the following characters: + - = . _ : / @.
 - If you enable instance tags in instance metadata, instance tag *keys* can only use letters (a-z, A-Z), numbers (0-9), and the following characters: + - = . , _ : @. Instance tag *keys* can't contain spaces or /, and can't comprise only . (one period), .. (two periods), or _index. For more information, see [Work with instance tags in instance metadata](#).
- Tag keys and values are case-sensitive.
- The aws : prefix is reserved for AWS use. If a tag has a tag key with this prefix, then you can't edit or delete the tag's key or value. Tags with the aws : prefix do not count against your tags per resource limit.

You can't terminate, stop, or delete a resource based solely on its tags; you must specify the resource identifier. For example, to delete snapshots that you tagged with a tag key called DeleteMe, you must use the DeleteSnapshots action with the resource identifiers of the snapshots, such as snap-1234567890abcdef0.

When you tag public or shared resources, the tags you assign are available only to your AWS account; no other AWS account will have access to those tags. For tag-based access control to shared resources, each AWS account must assign its own set of tags to control access to the resource.

You can't tag all resources. For more information, see [Tagging support for Amazon EC2 resources](#).

Tags and access management

If you're using AWS Identity and Access Management (IAM), you can control which users in your AWS account have permission to create, edit, or delete tags. For more information, see [Grant permission to tag resources during creation](#).

You can also use resource tags to implement attribute-based control (ABAC). You can create IAM policies that allow operations based on the tags for the resource. For more information, see [Control access to EC2 resources using resource tags](#).

Tag your resources for billing

You can use tags to organize your AWS bill to reflect your own cost structure. To do this, sign up to get your AWS account bill with tag key values included. For more information about setting up a cost allocation report with tags, see [Monthly cost allocation report](#) in the *AWS Billing User Guide*. To see the cost of your combined resources, you can organize your billing information based on resources that have the same tag key values. For example, you can tag several resources with a specific application name, and then organize your billing information to see the total cost of that application across several services. For more information, see [Using cost allocation tags](#) in the *AWS Billing User Guide*.

 **Note**

If you've just enabled reporting, data for the current month is available for viewing after 24 hours.

Cost allocation tags can indicate which resources are contributing to costs, but deleting or deactivating resources doesn't always reduce costs. For example, snapshot data that is referenced by another snapshot is preserved, even if the snapshot that contains the original data is deleted. For more information, see [Amazon Elastic Block Store volumes and snapshots](#) in the *AWS Billing User Guide*.

 **Note**

Elastic IP addresses that are tagged do not appear on your cost allocation report.

Work with tags using the console

You can use the Amazon EC2 console to display the tags of an individual resource, and to apply or remove tags from one resource at a time.

You can use the **Tag Editor** in the AWS Resource Groups console to display the tags of all of your Amazon EC2 resources across all Regions. You can view tags by resource and by resource type, and you can see which resource types are associated with a specified tag. You can apply or remove tags from multiple resources and multiple resource types at a time. The **Tag Editor** provides a central,

unified way to create and manage your tags. For more information, see the [Tagging AWS Resources User Guide](#).

Tasks

- [Display tags](#)
- [Add and delete tags on an individual resource](#)
- [Add and delete tags for multiple resources](#)
- [Add a tag when you launch an instance](#)
- [Filter a list of resources by tag](#)

Display tags

You can display the tags of an individual resource in the Amazon EC2 console. To display the tags of all your resources, use the **Tag Editor** in the AWS Resource Groups console.

Display tags of an individual resource

When you select a resource-specific page in the Amazon EC2 console, it displays a list of those resources. For example, if you select **Instances** from the navigation pane, the console displays your Amazon EC2 instances. When you select a resource from one of these lists (for example, an instance), if the resource supports tags, you can view and manage its tags. On most resource pages, you can view the tags by choosing the **Tags** tab.

You can add a column to the resource list to display all values for tags with the same key. You can use this column to sort and filter the resource list by the tag.

New console

To add a column to the resource list to display your tags

1. In the EC2 console, choose the **Preferences** gear-shaped icon in the top right corner of the screen.
2. In the **Preferences** dialog box, for **Tag columns** (at bottom left), select one or more tag keys, and then choose **Confirm**.

Old console

There are two ways to add a new column to the resource list to display your tags:

- On the **Tags** tab, select **Show Column**. A new column is added to the console.
- Choose the **Show/Hide Columns** gear-shaped icon, and in the **Show/Hide Columns** dialog box, select the tag key under **Your Tag Keys**.

Display tags for multiple resources

You can display tags across multiple resources by using the **Tag Editor** in the [AWS Resource Groups console](#). For more information, see the [Tagging AWS Resources User Guide](#).

Add and delete tags on an individual resource

You can manage tags for an individual resource directly from the resource's page.

To add a tag to an individual resource

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region where the resource to tag is located. For more information, see [Resource locations](#).
3. In the navigation pane, select a resource type (for example, **Instances**).
4. Select the resource from the resource list and choose the **Tags** tab.
5. Choose **Manage tags**, and then choose **Add new tag**. Enter the key and value for the tag. Choose **Add new tag** again for each additional tag to add. When you are finished adding tags, choose **Save**.

To delete a tag from an individual resource

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region where the resource to untag is located. For more information, see [Resource locations](#).
3. In the navigation pane, choose a resource type (for example, **Instances**).
4. Select the resource from the resource list and choose the **Tags** tab.
5. Choose **Manage tags**. For each tag to remove, choose **Remove**. When you are finished removing tags, choose **Save**.

Add and delete tags for multiple resources

To add a tag to multiple resources

1. Open the **Tag Editor** in the AWS Resource Groups console at <https://console.aws.amazon.com/resource-groups/tag-editor>.
2. For **Regions**, select one or more Regions where the resources to tag are located.
3. For **Resource types**, select the type of resources to tag (for example, **AWS::EC2::Instance**).
4. Choose **Search resources**.
5. Under **Resource search results**, select the check box next to each resource to tag.
6. Choose **Manage tags of selected resources**.
7. Under **Edit tags of all selected resources**, choose **Add tag**, and then enter the new tag key and value. Choose **Add tag** again for each additional tag to add.

 **Note**

If you add a new tag with the same tag key as an existing tag, the new tag overwrites the existing tag.

8. Choose **Review and apply tag changes**.
9. Choose **Apply changes to all selected**.

To remove a tag from multiple resources

1. Open the **Tag Editor** in the AWS Resource Groups console at <https://console.aws.amazon.com/resource-groups/tag-editor>.
2. For **Regions**, select the Regions where the resources to untag are located.
3. For **Resource types**, select the type of resources to untag (for example, **AWS::EC2::Instance**).
4. Choose **Search resources**.
5. Under **Resource search results**, select the check box next to each resource to untag.
6. Choose **Manage tags of selected resources**.
7. Under **Edit tags of all selected resources**, next to the tag to remove, choose **Remove tag**.
8. Choose **Review and apply tag changes**.
9. Choose **Apply changes to all selected**.

Add a tag when you launch an instance

New console

To add a tag using the launch instance wizard

1. From the navigation bar, select the Region for the instance. This choice is important because some Amazon EC2 resources can be shared between Regions, while others can't. Select the Region that meets your needs. For more information, see [Resource locations](#).
2. Choose **Launch instance**.
3. Under **Name and tags**, you can enter a descriptive name for your instance and specify tags.

The instance name is a tag, where the key is **Name**, and the value is the name that you specify. You can tag the instance, volumes, elastic graphics, and network interfaces. For Spot Instances, you can tag the Spot Instance request only.

Specifying an instance name and additional tags is optional.

- For **Name**, enter a descriptive name for the instance. If you don't specify a name, the instance can be identified by its ID, which is automatically generated when you launch the instance.
 - To add additional tags, choose **Add additional tags**. Choose **Add tag**, and then enter a key and value, and select the resource type to tag. Choose **Add tag** again for each additional tag to add.
4. Under **Application and OS Images (Amazon Machine Image)**, choose the operating system (OS) for your instance and an AMI. For more information, see [Application and OS Images \(Amazon Machine Image\)](#).
 5. Under **Key pair (login)**, for **Key pair name**, choose an existing key pair or create a new one.
 6. Either keep all the other fields at their default values or choose specific values for your desired instance configuration. For information about the fields, see [Launch an instance using defined parameters](#).
 7. In the **Summary** panel, review your settings, and then choose **Launch instance**.

Old console

To add a tag using the launch instance wizard

1. From the navigation bar, select the Region for the instance. This choice is important because some Amazon EC2 resources can be shared between Regions, while others can't. Select the Region that meets your needs. For more information, see [Resource locations](#).
2. Choose **Launch Instance**.
3. The **Choose an Amazon Machine Image (AMI)** page displays a list of basic configurations called Amazon Machine Images (AMIs). Select the AMI to use and choose **Select**. For more information, see [Find a Windows AMI](#).
4. On the **Configure Instance Details** page, configure the instance settings as necessary, and then choose **Next: Add Storage**.
5. On the **Add Storage** page, you can specify additional storage volumes for your instance. Choose **Next: Add Tags** when done.
6. On the **Add Tags** page, specify tags for the instance, the volumes, or both. Choose **Add another tag** to add more than one tag to your instance. Choose **Next: Configure Security Group** when you are done.
7. On the **Configure Security Group** page, you can choose from an existing security group that you own, or let the wizard create a new security group for you. Choose **Review and Launch** when you are done.
8. Review your settings. When you're satisfied with your selections, choose **Launch**. Select an existing key pair or create a new one, select the acknowledgment check box, and then choose **Launch Instances**.

Filter a list of resources by tag

You can filter your list of resources based on one or more tag keys and tag values.

To filter a list of resources by tag in the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, select a resource type (for example, **Instances**).
3. Choose the search field.
4. In the list, under **Tags**, choose the tag key.

5. Choose the corresponding tag value from the list.
6. When you are finished, remove the filter.

For more information about using filters in the Amazon EC2 console, see [List and filter your resources](#).

To filter multiple resources across multiple Regions by tag using the Tag Editor

You can use the **Tag Editor** in the AWS Resource Groups console to filter multiple resources across multiple Regions by tag. For more information, see [Finding resources to tag](#) in the *Tagging AWS Resources User Guide*.

Work with tags using the command line

You can add tags to many EC2 resources when you create them, using the tag specifications parameter for the create command. You can view the tags for a resource using the describe command for the resource. You can also add, update, or delete tags for your existing resources using the following commands.

Task	AWS CLI	AWS Tools for Windows PowerShell
Add or overwrite one or more tags	create-tags	New-EC2Tag
Delete one or more tags	delete-tags	Remove-EC2Tag
Describe one or more tags	describe-tags	Get-EC2Tag

Tasks

- [Add tags on resource creation](#)
- [Add tags to an existing resource](#)
- [Describe tagged resources](#)

Add tags on resource creation

The following examples demonstrate how to apply tags when you create resources.

Note

The way you enter JSON-formatted parameters on the command line differs depending on your operating system.

- Linux, macOS, or Unix and Windows PowerShell – Use single quotes ('') to enclose the JSON data structure.
- Windows – Omit the single quotes when using the commands with the Windows command line.

For more information, see [Specifying parameter values for the AWS CLI](#).

Example Example: Launch an instance and apply tags to the instance and volume

The following [run-instances](#) command launches an instance and applies a tag with the key **webserver** and the value **production** to the instance. The command also applies a tag with the key **cost-center** and the value **cc123** to any EBS volume that's created (in this case, the root volume).

```
aws ec2 run-instances \
--image-id ami-abc12345 \
--count 1 \
--instance-type t2.micro \
--key-name MyKeyPair \
--subnet-id subnet-6e7f829e \
--tag-specifications
'ResourceType=instance,Tags=[{Key=webserver,Value=production}]'
'ResourceType=volume,Tags=[{Key=cost-center,Value=cc123}]'
```

You can apply the same tag keys and values to both instances and volumes during launch. The following command launches an instance and applies a tag with a key of **cost-center** and a value of **cc123** to both the instance and any EBS volume that's created.

```
aws ec2 run-instances \
--image-id ami-abc12345 \
--count 1 \
--instance-type t2.micro \
--key-name MyKeyPair \
```

```
--subnet-id subnet-6e7f829e \
--tag-specifications 'ResourceType=instance,Tags=[{Key=cost-center,Value=cc123}]'
' ResourceType=volume,Tags=[{Key=cost-center,Value=cc123}]'
```

Example Example: Create a volume and apply a tag

The following [create-volume](#) command creates a volume and applies two tags: **purpose=production** and **cost-center=cc123**.

```
aws ec2 create-volume \
--availability-zone us-east-1a \
--volume-type gp2 \
--size 80 \
--tag-specifications 'ResourceType=volume,Tags=[{Key=purpose,Value=production},
{Key=cost-center,Value=cc123}]'
```

Add tags to an existing resource

The following examples demonstrate how to add tags to an existing resource using the [create-tags](#) command.

Example Example: Add a tag to a resource

The following command adds the tag **Stack=production** to the specified image, or overwrites an existing tag for the AMI where the tag key is **Stack**. If the command succeeds, no output is returned.

```
aws ec2 create-tags \
--resources ami-78a54011 \
--tags Key=Stack,Value=production
```

Example Example: Add tags to multiple resources

This example adds (or overwrites) two tags for an AMI and an instance. One of the tags contains just a key (**webserver**), with no value (we set the value to an empty string). The other tag consists of a key (**stack**) and value (**Production**). If the command succeeds, no output is returned.

```
aws ec2 create-tags \
--resources ami-1a2b3c4d i-1234567890abcdef0 \
--tags Key=webserver,Value= Key=stack,Value=Production
```

Example Example: Add tags with special characters

This example adds the tag **[Group]=test** to an instance. The square brackets ([and]) are special characters, which must be escaped.

If you are using Linux or OS X, to escape the special characters, enclose the element with the special character with double quotes ("), and then enclose the entire key and value structure with single quotes (').

```
aws ec2 create-tags \
--resources i-1234567890abcdef0 \
--tags 'Key="[Group]",Value=test'
```

If you are using Windows, to escape the special characters, enclose the element that has special characters with double quotes ("), and then precede each double quote character with a backslash (\) as follows:

```
aws ec2 create-tags ^
--resources i-1234567890abcdef0 ^
--tags Key=\"[Group]\",Value=test
```

If you are using Windows PowerShell, to escape the special characters, enclose the value that has special characters with double quotes ("), precede each double quote character with a backslash (\), and then enclose the entire key and value structure with single quotes (') as follows:

```
aws ec2 create-tags ` 
--resources i-1234567890abcdef0 ` 
--tags 'Key=\"[Group]\",Value=test'
```

Describe tagged resources

The following examples show you how to use filters with the [describe-instances](#) to view instances with specific tags. All EC2 describe commands use this syntax to filter by tag across a single resource type. Alternatively, you can use the [describe-tags](#) command to filter by tag across EC2 resource types.

Example Example: Describe instances with the specified tag key

The following command describes the instances with a **Stack** tag, regardless of the value of the tag.

```
aws ec2 describe-instances \
--filters Name=tag-key,Values=Stack
```

Example Example: Describe instances with the specified tag

The following command describes the instances with the tag **Stack=production**.

```
aws ec2 describe-instances \
--filters Name=tag:Stack,Values=production
```

Example Example: Describe instances with the specified tag value

The following command describes the instances with a tag with the value **production**, regardless of the tag key.

```
aws ec2 describe-instances \
--filters Name=tag-value,Values=production
```

Example Example: Describe all EC2 resources with the specified tag

The following command describes all EC2 resources with the tag **Stack=Test**.

```
aws ec2 describe-tags \
--filters Name=key,Values=Stack Name=value,Values=Test
```

Work with instance tags in instance metadata

You can access an instance's tags from the instance metadata. By accessing tags from the instance metadata, you no longer need to use the `DescribeInstances` or `DescribeTags` API calls to retrieve tag information, which reduces your API transactions per second, and lets your tag retrievals scale with the number of instances that you control. Furthermore, local processes that are running on an instance can view the instance's tag information directly from the instance metadata.

By default, tags are not available from the instance metadata; you must explicitly allow access. You can allow access at instance launch, or after launch on a running or stopped instance. You can also allow access to tags by specifying this in a launch template. Instances that are launched by using the template allow access to tags in the instance metadata.

If you add or remove an instance tag, the instance metadata is updated while the instance is running, without needing to stop and then start the instance.

Topics

- [Allow access to tags in instance metadata](#)
- [Turn off access to tags in instance metadata](#)
- [View if access to tags in instance metadata is allowed](#)
- [Retrieve tags from instance metadata](#)

Allow access to tags in instance metadata

By default, there is no access to instance tags in the instance metadata. For each instance, you must explicitly allow access by using one of the following methods.

To allow access to tags in instance metadata using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select an instance, and then choose **Actions**, **Instance settings**, **Allow tags in instance metadata**.
4. To allow access to tags in instance metadata, select the **Allow** check box.
5. Choose **Save**.

To allow access to tags in instance metadata at launch using the AWS CLI

Use the [run-instances](#) command and set `InstanceMetadataTags` to `enabled`.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type c3.large \
    ...
    --metadata-options "InstanceMetadataTags=enabled"
```

To allow access to tags in instance metadata on a running or stopped instance using the AWS CLI

Use the [modify-instance-metadata-options](#) command and set `--instance-metadata-tags` to `enabled`.

```
aws ec2 modify-instance-metadata-options \
--instance-id i-123456789example \
--instance-metadata-tags enabled
```

Turn off access to tags in instance metadata

To turn off access to instance tags in the instance metadata, use one of the following methods. You don't need to turn off access to instance tags on instance metadata at launch because it's turned off by default.

To turn off access to tags in instance metadata using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select an instance, and then choose **Actions**, **Instance settings**, **Allow tags in instance metadata**.
4. To turn off access to tags in instance metadata, clear the **Allow** check box.
5. Choose **Save**.

To turn off access to tags in instance metadata using the AWS CLI

Use the [modify-instance-metadata-options](#) command and set `--instance-metadata-tags` to `disabled`.

```
aws ec2 modify-instance-metadata-options \
--instance-id i-123456789example \
--instance-metadata-tags disabled
```

View if access to tags in instance metadata is allowed

For each instance, you can use the Amazon EC2 console or AWS CLI to view whether access to instance tags from the instance metadata is allowed.

To view if access to tags in instance metadata is allowed using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Instances**, and then select an instance.
3. On the **Details** tab, check the **Allow tags in instance metadata** field. If the value is **Enabled**, tags in instance metadata is allowed. If the value is **Disabled**, tags in instance metadata is not allowed.

To view if access to tags in instance metadata is allowed using the AWS CLI

Use the [describe-instances](#) command and specify the instance ID.

```
aws ec2 describe-instances \
--instance-ids i-1234567890abcdef0
```

The following example output is truncated for space. The "InstanceMetadataTags" parameter indicates whether tags in instance metadata is allowed. If the value is enabled, tags in instance metadata is allowed. If the value is disabled, tags in instance metadata is not allowed.

```
{
  "Reservations": [
    {
      "Groups": [],
      "Instances": [
        {
          "AmiLaunchIndex": 0,
          "ImageId": "ami-0abcdef1234567890",
          "InstanceId": "i-1234567890abcdef0",
          ...
        }
      ],
      "MetadataOptions": {
        "State": "applied",
        "HttpTokens": "optional",
        "HttpPutResponseHopLimit": 1,
        "HttpEndpoint": "enabled",
        "HttpProtocolIpv6": "disabled",
        "InstanceMetadataTags": "enabled"
      },
      ...
    }
  ]
}
```

Retrieve tags from instance metadata

If instance tags are allowed in the instance metadata, the tags/instance category is accessible from the instance metadata. For examples on how to retrieve tags from the instance metadata, see [Get the instance tags for an instance](#).

Add tags to a resource using CloudFormation

With Amazon EC2 resource types, you specify tags using either a Tags or TagSpecifications property.

The following examples add the tag **Stack=Production** to [AWS::EC2::Instance](#) using its Tags property.

Example Example: Tags in YAML

```
Tags:  
- Key: "Stack"  
  Value: "Production"
```

Example Example: Tags in JSON

```
"Tags": [  
  {  
    "Key": "Stack",  
    "Value": "Production"  
  }  
]
```

The following examples add the tag **Stack=Production** to [AWS::EC2::LaunchTemplate](#) [LaunchTemplateData](#) using its TagSpecifications property.

Example Example: TagSpecifications in YAML

```
TagSpecifications:  
- ResourceType: "instance"  
  Tags:  
    - Key: "Stack"  
      Value: "Production"
```

Example Example: TagSpecifications in JSON

```
"TagSpecifications": [  
    {  
        "ResourceType": "instance",  
        "Tags": [  
            {  
                "Key": "Stack",  
                "Value": "Production"  
            }  
        ]  
    }  
]
```

Amazon EC2 service quotas

Amazon EC2 provides different resources that you can use. These resources include images, instances, volumes, and snapshots. When you create your AWS account, we set default *quotas* (also referred to as limits) on these resources on a per-Region basis. For example, there is a maximum number of instances that you can launch in a Region. So if you were to launch an instance in the US West (Oregon) Region, for example, the request must not cause your usage to exceed your maximum number of instances in that Region.

The Service Quotas console is a central location where you can view and manage your quotas for AWS services, and request a quota increase for many of the resources that you use. Use the quota information that we provide to manage your AWS infrastructure. Plan to request any quota increases in advance of the time that you'll need them.

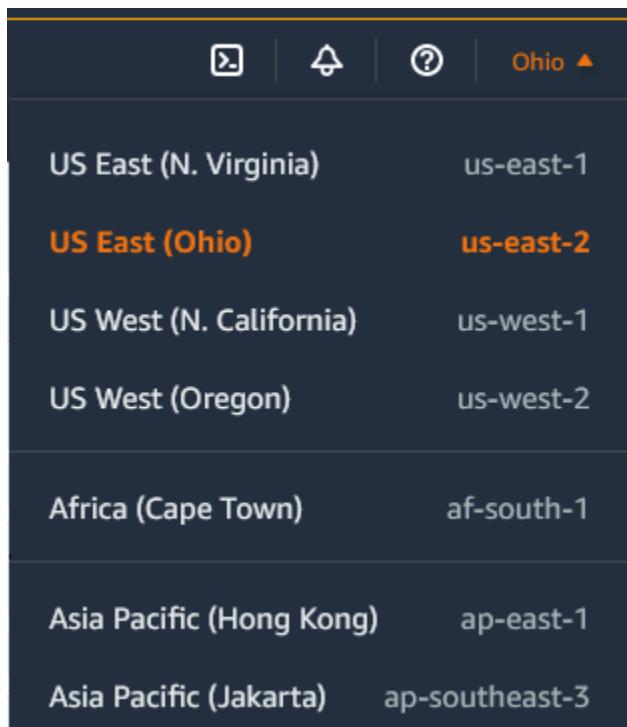

For more information, see [Amazon EC2 endpoints and quotas](#) and [Amazon EBS endpoints and quotas](#) in the *Amazon Web Services General Reference*.

View your current quotas

You can view your quotas for each Region using the Service Quotas console.

To view your current quotas using the Service Quotas console

1. Open the Service Quotas console at <https://console.aws.amazon.com/servicequotas/home/services/ec2/quotas/>.
2. From the navigation bar (at the top of the screen), select a Region.

3. Use the filter field to filter the list by resource name. For example, enter **On-Demand** to locate the quotas for On-Demand Instances.
4. To view more information, choose the quota name to open the details page for the quota.

Request an increase

You can request a quota increase for each Region.

To request an increase using the Service Quotas console

1. Open the Service Quotas console at <https://console.aws.amazon.com/servicequotas/home/services/ec2/quotas/>.
2. From the navigation bar (at the top of the screen), select a Region.
3. Use the filter field to filter the list by resource name. For example, enter **On-Demand** to locate the quotas for On-Demand Instances.
4. If the quota is adjustable, choose the quota and then choose **Request quota increase**.
5. For **Change quota value**, enter the new quota value.
6. Choose **Request**.
7. To view any pending or recently resolved requests in the console, choose **Dashboard** from the navigation pane. For pending requests, choose the status of the request to open the

request receipt. The initial status of a request is **Pending**. After the status changes to **Quota requested**, you'll see the case number with AWS Support. Choose the case number to open the ticket for your request.

For more information, including how to use the AWS CLI or SDKs to request a quota increase, see [Requesting a quota increase](#) in the *Service Quotas User Guide*.

Restriction on email sent using port 25

On all instances, Amazon EC2 restricts outbound traffic to public IP addresses over port 25 by default. You can request that this restriction be removed. For more information, see [How do I remove the restriction on port 25 from my Amazon EC2 instance or AWS Lambda function?](#) on AWS re:Post.

Note

This restriction does not apply to outbound traffic sent over port 25 to:

- IP addresses in the primary CIDR block of the VPC in which the originating network interface exists.
- IP addresses in the CIDRs defined in [RFC 1918](#), [RFC 6598](#), and [RFC 4193](#).

Amazon EC2 usage reports

AWS provides a free reporting tool called AWS Cost Explorer that enables you to analyze the cost and usage of your EC2 instances and the usage of your Reserved Instances. You can view data up to the last 12 months, and forecast how much you are likely to spend for the next three months. You can use Cost Explorer to see patterns in how much you spend on AWS resources over time, identify areas that need further inquiry, and see trends that you can use to understand your costs. You also can specify time ranges for the data, and view time data by day or by month.

Here's an example of some of the questions that you can answer when using Cost Explorer:

- How much am I spending on instances of each instance type?
- How many instance hours are being used by a particular department?
- How is my instance usage distributed across Availability Zones?

- How is my instance usage distributed across AWS accounts?
- How well am I using my Reserved Instances?
- Are my Reserved Instances helping me save money?

For more information about working with reports in Cost Explorer, including saving reports, see [Analyzing your costs with AWS Cost Explorer](#) in the *AWS Cost Management User Guide*.

Track your Free Tier usage

You can use Amazon EC2 without incurring charges if you've been an AWS customer for less than 12 months and you stay within the AWS Free Tier usage limits. It's important to track your Free Tier usage to avoid billing surprises. If you exceed the Free Tier limits, you'll incur standard pay-as-go charges.

Note

If you've been an AWS customer for more than 12 months, you're no longer eligible for Free Tier usage and you won't see the **EC2 Free Tier** box that is described in the following procedure.

To track your Free Tier usage

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **EC2 Dashboard**.
3. Find the **EC2 Free Tier** box (at top right).

EC2 Free Tier [Info](#)

Offers for all AWS Regions.

3 EC2 free tier offers in use

End of month forecast

⚠ 2 offers forecasted to exceed free tier limit.

Exceeds free tier

⚠ 1 offers exceeded and is now pay-as-you-go pricing.

[View Global EC2 resources](#)

Offer usage (monthly)

Windows EC2 Instances

Linux EC2 Instances

Storage space on EBS

[View all AWS Free Tier offers](#) 

4. In the **EC2 Free Tier** box, check your Free Tier usage, as follows:

- Under **EC2 Free Tier offers in use**, take note of the warnings:
 - **End of month forecast** – This warns that you will incur charges this month if you continue with your current usage pattern.
 - **Exceeds Free Tier** – This warns that you've exceeded your Free Tier limits and you're already incurring charges.

- Under **Offer usage (monthly)**, take note of your usage of Linux instances, Windows instances, and EBS storage. The percentage indicates how much of your Free Tier limits you've used this month. If you're at 100%, you will incur charges for further use.

 **Note**

This information appears only after you've created an instance. However, usage information is not updated in real time; it's updated three times a day.

5. To avoid incurring further charges, delete any resources that are either incurring charges now, or will incur charges if you exceed your Free Tier limit usage.
 - For the instructions to delete your instance, go to the next step in this tutorial.
 - To check if you have resources in other Regions that might be incurring charges, in the **EC2 Free Tier** box, choose **View Global EC2 resources** to open the **EC2 Global View**. For more information, see [Amazon EC2 Global View](#).
6. To view your resource usage for all AWS services under the AWS Free Tier, at the bottom of the **EC2 Free Tier** box, choose **View all AWS Free Tier offers**. For more information, see [Using the AWS Free Tier](#) in the *AWS Billing User Guide*.

Troubleshoot EC2 Windows instances

The following procedures and tips can help you troubleshoot problems with your Amazon EC2 Windows instances.

Contents

- [Common issues with Windows instances](#)
- [Common messages troubleshooting Windows instances](#)
- [Troubleshoot instance launch issues](#)
- [Troubleshoot connecting to your Windows instance](#)
- [Troubleshoot an unreachable instance](#)

- [Troubleshoot stopping your instance](#)
- [Troubleshoot instance termination \(shutting down\)](#)
- [Troubleshoot Sysprep](#)
- [Use EC2Rescue for Windows Server](#)
- [EC2 Serial Console for Windows instances](#)
- [Send a diagnostic interrupt \(for advanced users\)](#)

To get additional information for troubleshooting problems with your instance, use [Use EC2Rescue for Windows Server](#). For information about troubleshooting issues with PV drivers, see [Troubleshoot PV drivers](#).

Common issues with Windows instances

The following are troubleshooting tips to help you solve common issues with EC2 Windows Server instances.

Issues

- [EBS volumes don't initialize on Windows Server 2016 and 2019](#)
- [Boot an EC2 Windows instance into Directory Services Restore Mode \(DSRM\)](#)
- [Instance loses network connectivity or scheduled tasks don't run when expected](#)

- [Unable to get console output](#)
- [Windows Server 2012 R2 not available on the network](#)
- [Disk signature collision](#)

EBS volumes don't initialize on Windows Server 2016 and 2019

Instances created from Amazon Machine Images (AMIs) for Windows Server 2016 and 2019 use the EC2Launch v1 agent for a variety of startup tasks, including initializing EBS volumes. By default, EC2Launch v1 doesn't initialize secondary volumes. However, you can configure EC2Launch v1 to initialize these disks automatically, as follows.

Map drive letters to volumes

1. Connect to the instance to configure and open the C:\ProgramData\Amazon\EC2-Windows\Launch\Config\DriveLetterMappingConfig.json file in a text editor.
2. Specify the volume settings as follows:

```
{  
  "driveLetterMapping": [  
    {  
      "volumeName": "sample volume",  
      "driveLetter": "H"  
    }]  
}
```

3. Save your changes and close the file.
4. Open Windows PowerShell and use the following command to run the EC2Launch v1 script that initializes the disks:

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeDisks.ps1
```

To initialize the disks each time the instance boots, add the -Schedule flag as follows:

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeDisks.ps1 -  
Schedule
```

The EC2Launch v1 agent can run instance initialization scripts such as `initializeDisks.ps1` in parallel with the `InitializeInstance.ps1` script. If the

`InitializeInstance.ps1` script reboots the instance, it might interrupt other scheduled tasks that run at instance startup. To avoid any potential conflicts, we recommend that you add logic to your `initializeDisks.ps1` script to ensure that instance initialization has finished first.

 **Note**

If the EC2Launch script does not initialize the volumes, ensure that the volumes are online. If the volumes are offline, run the following command to bring all disks online.

```
PS C:\> Get-Disk | Where-Object IsOffline -Eq $True | Set-Disk -IsOffline  
$False
```

Boot an EC2 Windows instance into Directory Services Restore Mode (DSRM)

If an instance running Microsoft Active Directory experiences a system failure or other critical issues you can troubleshoot the instance by booting into a special version of Safe Mode called *Directory Services Restore Mode* (DSRM). In DSRM you can repair or recover Active Directory.

Driver support for DSRM

How you enable DSRM and boot into the instance depends on the drivers the instance is running. In the EC2 console you can view driver version details for an instance from the System Log. The following table shows which drivers are supported for DSRM.

Driver Versions	DSRM Supported?	Next Steps
Citrix PV 5.9	No	Restore the instance from a backup. You cannot enable DSRM.
AWS PV 7.2.0	No	Though DSRM is not supported for this driver, you can still detach the root volume from the instance, take a snapshot of the volume or create an AMI from it, and attach it to another instance in the same Availability Zone.

Driver Versions	DSRM Supported?	Next Steps
		Zone as a secondary volume. You can then enable DSRM (as described in this section).
AWS PV 7.2.2 and later	Yes	Detach the root volume, attach it to another instance, and enable DSRM (as described in this section).
Enhanced Networking	Yes	Detach the root volume, attach it to another instance, and enable DSRM (as described in this section).

For information about how to enable Enhanced Networking, see [Enabling Enhanced Networking on Windows Instances in a VPC](#). For more information about upgrading AWS PV drivers, see [Upgrade PV drivers on Windows instances](#).

Configure an instance to boot into DSRM

EC2 Windows instances do not have network connectivity before the operating system is running. For this reason, you cannot press the F8 button on your keyboard to select a boot option. You must use one of the following procedures to boot an EC2 Windows Server instance into DSRM.

If you suspect that Active Directory has been corrupted and the instance is still running, you can configure the instance to boot into DSRM using either the System Configuration dialog box or the command prompt.

To boot an online instance into DSRM using the System Configuration dialog box

1. In the **Run** dialog box, type `msconfig` and press Enter.
2. Choose the **Boot** tab.
3. Under **Boot options** choose **Safe boot**.
4. Choose **Active Directory repair** and then choose **OK**. The system prompts you to reboot the server.

To boot an online instance into DSRM using the command line

From a Command Prompt window, run the following command:

```
bcDEDIT /set safeboot dsrepair
```

If an instance is offline and unreachable, you must detach the root volume and attach it to another instance to enable DSRM mode.

To boot an offline instance into DSRM

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Locate and select the affected instance. Choose **Instance state, Stop instance**.
4. Choose **Launch instances** and create a temporary instance in the same Availability Zone as the affected instance. Choose an instance type that uses a different version of Windows. For example, if your instance is Windows Server 2008, then choose a Windows Server 2008 R2 instance.

 **Important**

If you do not create the instance in the same Availability Zone as the affected instance you will not be able to attach the root volume of the affected instance to the new instance.

5. In the navigation pane, choose **Volumes**.
6. Locate the root volume of the affected instance. [Detach](#) the volume and [attach](#) it to the temporary instance you created earlier. Attach it with the default device name (xvdf).
7. Use Remote Desktop to connect to the temporary instance, and then use the Disk Management utility to [make the volume available for use](#).
8. Open a command prompt and run the following command. Replace *D* with the actual drive letter of the secondary volume you just attached:

```
bcDEDIT /store D:\Boot\BCD /set {default} safeboot dsrepair
```

9. In the Disk Management Utility, choose the drive you attached earlier, open the context (right-click) menu, and choose **Offline**.
10. In the EC2 console, detach the affected volume from the temporary instance and reattach it to your original instance with the device name /dev/sda1. You must specify this device name to designate the volume as a root volume.

11. [Start](#) the instance.
12. After the instance passes the health checks in the EC2 console, connect to the instance using Remote Desktop and verify that it boots into DSRM mode.
13. (Optional) Delete or stop the temporary instance you created in this procedure.

Instance loses network connectivity or scheduled tasks don't run when expected

If you restart your instance and it loses network connectivity, it's possible that the instance has the wrong time.

By default, Windows instances use Coordinated Universal Time (UTC). If you set the time for your instance to a different time zone and then restart it, the time becomes offset and the instance temporarily loses its IP address. The instance regains network connectivity eventually, but this can take several hours. The amount of time that it takes for the instance to regain network connectivity depends on the difference between UTC and the other time zone.

This same time issue can also result in scheduled tasks not running when you expect them to. In this case, the scheduled tasks do not run when expected because the instance has the incorrect time.

To use a time zone other than UTC persistently, you must set the **RealTimeIsUniversal** registry key. Without this key, an instance uses UTC after you restart it.

To resolve time issues that cause a loss of network connectivity

1. Ensure that you are running the recommended PV drivers. For more information, see [Upgrade PV drivers on Windows instances](#).
2. Verify that the following registry key exists and is set to 1: **HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\TimeZoneInformation\RealTimeIsUniversal**

Unable to get console output

For Windows instances, the instance console displays the output from tasks performed during the Windows boot process. If Windows boots successfully, the last message logged is Windows is Ready to use. Note that you can also display event log messages in the console, but this feature is not enabled by default. For more information, see [EC2 service properties](#).

To get the console output for your instance using the Amazon EC2 console, select the instance, and then choose **Actions, Monitor and troubleshoot, Get system log**. To get the console output using the command line, use one of the following commands: [get-console-output](#) (AWS CLI) or [Get-EC2ConsoleOutput](#) (AWS Tools for Windows PowerShell).

For instances running Windows Server 2012 R2 and earlier, if the console output is empty, it could indicate an issue with the EC2Config service, such as a misconfigured configuration file, or that Windows failed to boot properly. To fix the issue, download and install the latest version of EC2Config. For more information, see [Install the latest version of EC2Config](#).

Windows Server 2012 R2 not available on the network

For information about troubleshooting a Windows Server 2012 R2 instance that is not available on the network, see [Windows Server 2012 R2 loses network and storage connectivity after an instance reboot](#).

Disk signature collision

You can check for and resolve disk signature collisions using [EC2Rescue for Windows Server](#). Or, you can manually resolve disk signature issues by performing the following steps.

Warning

The following procedure describes how to edit the Windows Registry using Registry Editor. If you are not familiar with the Windows Registry or how to safely make changes using Registry Editor, see [Configure the Registry](#).

1. Open a command prompt, type **regedit.exe**, and press Enter.
2. In the **Registry Editor**, choose **HKEY_LOCAL_MACHINE** from the context menu (right-click), and then choose **Find**.
3. Type **Windows Boot Manager** and then choose **Find Next**.
4. Choose the key named **11000001**. This key is a sibling of the key you found in the previous step.
5. In the right pane, choose **Element** and then choose **Modify** from the context menu (right-click).

6. Locate the four-byte disk signature at offset 0x38 in the data. This is the Boot Configuration Database signature (BCD). Reverse the bytes to create the disk signature, and write it down. For example, the disk signature represented by the following data is E9EB3AA5:

```
...
0030  00 00 00 00 01 00 00 00
0038  A5 3A EB E9 00 00 00 00
0040  00 00 00 00 00 00 00 00
...
...
```

7. In a Command Prompt window, run the following command to start Microsoft DiskPart.

```
diskpart
```

8. Run the `select disk` DiskPart command and specify the disk number for the volume with the disk signature collision.

 **Tip**

To check the disk number for the volume with the disk signature collision, use the **Disk Management** utility. Open a command prompt, type `compmgmt.msc` and press **Enter**. In the left-hand navigation panel, double-click **Disk Management**. In the **Disk Management** utility, check the disk number for the offline volume with the disk signature collision.

```
DISKPART> select disk 1
Disk 1 is now the selected disk.
```

9. Run the following DiskPart command to get the disk signature.

```
DISKPART> uniqueid disk
Disk ID: 0C764FA8
```

10. If the disk signature shown in the previous step doesn't match the disk signature that you wrote down earlier, use the following DiskPart command to change the disk signature so that it matches:

```
DISKPART> uniqueid disk id=E9EB3AA5
```

Common messages troubleshooting Windows instances

This section includes tips to help you troubleshoot issues based on common messages.

Topics

- ["Password is not available"](#)
- ["Password not available yet"](#)
- ["Cannot retrieve Windows password"](#)
- ["Waiting for the metadata service"](#)
- ["Unable to activate Windows"](#)
- ["Windows is not genuine \(0x80070005\)"](#)
- ["No Terminal Server License Servers available to provide a license"](#)
- ["Some settings are managed by your organization"](#)

"Password is not available"

To connect to a Windows instance using Remote Desktop, you must specify an account and password. The accounts and passwords provided are based on the AMI that you used to launch the instance. You can either retrieve the auto-generated password for the Administrator account, or use the account and password that were in use in the original instance from which the AMI was created.

You can generate a password for the Administrator account for instances launched using a custom Windows AMI. To generate the password, you will need to configure some settings in the operating system before the AMI is created. For more information, see [Create a custom Windows AMI](#).

If your Windows instance isn't configured to generate a random password, you'll receive the following message when you retrieve the auto-generated password using the console:

```
 Password is not available.  
 The instance was launched from a custom AMI, or the default password has changed. A  
 password cannot be retrieved for this instance. If you have forgotten your password,  
 you can  
 reset it using the Amazon EC2 configuration service. For more information, see  
 Passwords for a  
 Windows Server instance.
```

Check the console output for the instance to see whether the AMI that you used to launch it was created with password generation disabled. If password generation is disabled, the console output contains the following:

```
Ec2SetPassword: Disabled
```

If password generation is disabled and you don't remember the password for the original instance, you can reset the password for this instance. For more information, see [Reset a lost or expired Windows administrator password](#).

"Password not available yet"

To connect to a Windows instance using Remote Desktop, you must specify an account and password. The accounts and passwords provided are based on the AMI that you used to launch the instance. You can either retrieve the auto-generated password for the Administrator account, or use the account and password that were in use in the original instance from which the AMI was created.

Your password should be available within a few minutes. If the password isn't available, you'll receive the following message when you retrieve the auto-generated password using the console:

```
Password not available yet.
```

```
Please wait at least 4 minutes after launching an instance before trying to retrieve  
the  
auto-generated password.
```

If it's been longer than four minutes and you still can't get the password, it's possible that the launch agent for your instance is not configured to generate a password. Verify by checking whether the console output is empty. For more information, see [Unable to get console output](#).

Also verify that the AWS Identity and Access Management (IAM) account being used to access the Management Portal has the ec2:GetPasswordData action allowed. For more information about IAM permissions, see [What is IAM?](#).

"Cannot retrieve Windows password"

To retrieve the auto-generated password for the Administrator account, you must use the private key for the key pair that you specified when you launched the instance. If you didn't specify a key pair when you launched the instance, you'll receive the following message.

Cannot retrieve Windows password

You can terminate this instance and launch a new instance using the same AMI, making sure to specify a key pair.

"Waiting for the metadata service"

A Windows instance must obtain information from its instance metadata before it can activate itself. By default, the `WaitForMetaDataAvailable` setting ensures that the `EC2Config` service waits for the instance metadata to be accessible before continuing with the boot process. For more information, see [Instance metadata and user data](#).

If the instance is failing the instance reachability test, try the following to resolve this issue.

- Check the CIDR block for your VPC. A Windows instance cannot boot correctly if it's launched into a VPC that has an IP address range from 224.0.0.0 to 255.255.255.255 (Class D and Class E IP address ranges). These IP address ranges are reserved, and should not be assigned to host devices. We recommend that you create a VPC with a CIDR block from the private (non-publicly routable) IP address ranges as specified in [RFC 1918](#).
- It's possible that the system has been configured with a static IP address. Try [creating a network interface](#) and [attaching it to the instance](#).
- **To enable DHCP on a Windows instance that you can't connect to**
 1. Stop the affected instance and detach its root volume.
 2. Launch a temporary instance in the same Availability Zone as the affected instance.

Warning

If your temporary instance is based on the same AMI that the original instance is based on, you must complete additional steps or you won't be able to boot the original instance after you restore its root volume because of a disk signature collision. Alternatively, select a different AMI for the temporary instance. For example, if the original instance uses the AWS Windows AMI for Windows Server 2008 R2, launch the temporary instance using the AWS Windows AMI for Windows Server 2012.

3. Attach the root volume from the affected instance to this temporary instance. Connect to the temporary instance, open the **Disk Management** utility, and bring the drive online.

4. From the temporary instance, open **Regedit** and select **HKEY_LOCAL_MACHINE**. From the **File** menu, choose **Load Hive**. Select the drive, open the file `Windows\System32\config\SYSTEM`, and specify a key name when prompted (you can use any name).
5. Select the key that you just loaded and navigate to `ControlSet001\Services\Tcpip\Parameters\Interfaces`. Each network interface is listed by a GUID. Select the correct network interface. If DHCP is disabled and a static IP address assigned, `EnableDHCP` is set to 0. To enable DHCP, set `EnableDHCP` to 1, and delete the following keys if they exist: `NameServer`, `SubnetMask`, `IPAddress`, and `DefaultGateway`. Select the key again, and from the **File** menu, choose **Unload Hive**.

 **Note**

If you have multiple network interfaces, you'll need to identify the correct interface to enable DHCP. To identify the correct network interface, review the following key values `NameServer`, `SubnetMask`, `IPAddress`, and `DefaultGateway`. These values display the static configuration of the previous instance.

6. (Optional) If DHCP is already enabled, it's possible that you don't have a route to the metadata service. Updating EC2Config can resolve this issue.
 - a. [Download](#) and install the latest version of the EC2Config service. For more information about installing this service, see [Install the latest version of EC2Config](#).
 - b. Extract the files from the `.zip` file to the `Temp` directory on the drive you attached.
 - c. Open **Regedit** and select **HKEY_LOCAL_MACHINE**. From the **File** menu, choose **Load Hive**. Select the drive, open the file `Windows\System32\config\SOFTWARE`, and specify a key name when prompted (you can use any name).
 - d. Select the key that you just loaded and navigate to `Microsoft\Windows\CurrentVersion`. Select the `RunOnce` key. (If this key doesn't exist, right-click `CurrentVersion`, point to **New**, select **Key**, and name the key `RunOnce`.) Right-click, point to **New**, and select **String Value**. Enter `Ec2Install` as the name and `C:\Temp\Ec2Install.exe -q` as the data.
 - e. Select the key again, and from the **File** menu, choose **Unload Hive**.
7. (Optional) If your temporary instance is based on the same AMI that the original instance is based on, you must complete the following steps or you won't be able to boot the original instance after you restore its root volume because of a disk signature collision.

⚠️ Warning

The following procedure describes how to edit the Windows Registry using Registry Editor. If you are not familiar with the Windows Registry or how to safely make changes using Registry Editor, see [Configure the Registry](#).

- a. Open a command prompt, type **regedit.exe**, and press Enter.
- b. In the **Registry Editor**, choose **HKEY_LOCAL_MACHINE** from the context menu (right-click), and then choose **Find**.
- c. Type **Windows Boot Manager** and then choose **Find Next**.
- d. Choose the key named **11000001**. This key is a sibling of the key you found in the previous step.
- e. In the right pane, choose **Element** and then choose **Modify** from the context menu (right-click).
- f. Locate the four-byte disk signature at offset 0x38 in the data. Reverse the bytes to create the disk signature, and write it down. For example, the disk signature represented by the following data is E9EB3AA5:

```
...
0030  00 00 00 00 01 00 00 00
0038  A5 3A EB E9 00 00 00 00
0040  00 00 00 00 00 00 00 00
...
...
```

- g. In a Command Prompt window, run the following command to start Microsoft DiskPart.

```
diskpart
```

- h. Run the following DiskPart command to select the volume. (You can verify that the disk number is 1 using the **Disk Management** utility.)

```
DISKPART> select disk 1
Disk 1 is now the selected disk.
```

- i. Run the following DiskPart command to get the disk signature.

```
DISKPART> uniqueid disk
```

```
Disk ID: 0C764FA8
```

- j. If the disk signature shown in the previous step doesn't match the disk signature from BCD that you wrote down earlier, use the following DiskPart command to change the disk signature so that it matches:

```
DISKPART> uniqueid disk id=E9EB3AA5
```

8. Using the **Disk Management** utility, bring the drive offline.

 **Note**

The drive is automatically offline if the temporary instance is running the same operating system as the affected instance, so you won't need to bring it offline manually.

9. Detach the volume from the temporary instance. You can terminate the temporary instance if you have no further use for it.
10. Restore the root volume of the affected instance by attaching the volume as /dev/sda1.
11. Start the affected instance.

If you are connected to the instance, open an Internet browser from the instance and enter the following URL for the metadata server:

```
http://169.254.169.254/latest/meta-data/
```

If you can't contact the metadata server, try the following to resolve the issue:

- [Download](#) and install the latest version of the EC2Config service. For more information about installing this service, see [Install the latest version of EC2Config](#).
- Check whether the Windows instance is running RedHat PV drivers. If so, update to Citrix PV drivers. For more information, see [Upgrade PV drivers on Windows instances](#).
- Verify that the firewall, IPSec, and proxy settings do not block outgoing traffic to the metadata service (169.254.169.254) or the AWS KMS servers (the addresses are specified

in TargetKMSServer elements in C:\Program Files\Amazon\Ec2ConfigService\Settings\ActivationSettings.xml).

- Verify that you have a route to the metadata service (169.254.169.254) using the following command.

```
route print
```

- Check for network issues that might affect the Availability Zone for your instance. Go to <http://status.aws.amazon.com/>.

"Unable to activate Windows"

Windows instances use Windows AWS KMS activation. You can receive this message: A problem occurred when Windows tried to activate. Error Code 0xC004F074, if your instance can't reach the AWS KMS server. Windows must be activated every 180 days. EC2Config attempts to contact the AWS KMS server before the activation period expires to ensure that Windows remains activated.

If you encounter a Windows activation issue, use the following procedure to resolve the issue.

For EC2Config (Windows Server 2012 R2 AMIs and earlier)

- Download and install the latest version of the EC2Config service. For more information about installing this service, see [Install the latest version of EC2Config](#).
- Log onto the instance and open the following file: C:\Program Files\Amazon\Ec2ConfigService\Settings\config.xml.
- Locate the **Ec2WindowsActivate** plugin in the config.xml file. Change the state to **Enabled** and save your changes.
- In the Windows Services snap-in, restart the EC2Config service or reboot the instance.

If this does not resolve the activation issue, follow these additional steps.

- Set the AWS KMS target: **C:\> slmgr.vbs /skms 169.254.169.250:1688**
- Activate Windows: **C:\> slmgr.vbs /ato**

For EC2Launch (Windows Server 2016 AMIs and later)

1. From a PowerShell prompt with administrative rights, import the EC2Launch module:

```
PS C:\> Import-Module "C:\ProgramData\Amazon\EC2-Windows\Launch\Module\Ec2Launch.psd1"
```

2. Call the Add-Routes function to see the list of new routes:

```
PS C:\> Add-Routes
```

3. Call the Set-ActivationSettings function:

```
PS C:\> Set-Activationsettings
```

4. Then, run the following script to activate Windows:

```
PS C:\> cscript "${env:SYSTEMROOT}\system32\s1mgr.vbs" /ato
```

For both EC2Config and EC2Launch, if you are still receiving an activation error, verify the following information.

- Verify that you have routes to the AWS KMS servers. Open C:\Program Files\Amazon\Ec2ConfigService\Settings\ActivationSettings.xml and locate the TargetKMServer elements. Run the following command and check whether the addresses for these AWS KMS servers are listed.

```
route print
```

- Verify that the AWS KMS client key is set. Run the following command and check the output.

```
C:\Windows\System32\s1mgr.vbs /d1v
```

If the output contains Error: product key not found, the AWS KMS client key isn't set. If the AWS KMS client key isn't set, look up the client key as described in this Microsoft article: [AWS KMS Client Setup Keys](#), and then run the following command to set the AWS KMS client key.

```
C:\Windows\System32\s1mgr.vbs /ipk client_key
```

- Verify that the system has the correct time and time zone. If you are using Windows Server 2008 or later and a time zone other than UTC, add the following registry key and set it to 1 to ensure that the time is correct: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\TimeZoneInformation\RealTimeIsUniversal.
- If Windows Firewall is enabled, temporarily disable it using the following command.

```
netsh advfirewall set allprofiles state off
```

"Windows is not genuine (0x80070005)"

Windows instances use Windows AWS KMS activation. If an instance is unable to complete the activation process, it reports that the copy of Windows is not genuine.

Try the suggestions for ["Unable to activate Windows"](#).

"No Terminal Server License Servers available to provide a license"

By default, Windows Server is licensed for two simultaneous users through Remote Desktop. If you need to provide more than two users with simultaneous access to your Windows instance through Remote Desktop, you can purchase a Remote Desktop Services client access license (CAL) and install the Remote Desktop Session Host and Remote Desktop Licensing Server roles.

Check for the following issues:

- You've exceeded the maximum number of concurrent RDP sessions.
- You've installed the Windows Remote Desktop Services role.
- Licensing has expired. If the licensing has expired, you can't connect to your Windows instance as a user. You can try the following:
 - Connect to the instance from the command line using an /admin parameter, for example:

```
mstsc /v:instance /admin
```

For more information, see the following Microsoft article: [Access Remote Desktop Via Command Line](#).

- Stop the instance, detach its Amazon EBS volumes, and attach them to another instance in the same Availability Zone to recover your data.

"Some settings are managed by your organization"

Instances launched from the latest Windows Server AMIs might show a Windows Update dialog message stating "Some settings are managed by your organization." This message appears as a result of changes in Windows Server and does not impact the behavior of Windows Update or your ability to manage update settings.

To remove the warning

1. Open gpedit.msc and navigate to **Computer Configuration, Administrative Templates, Windows Components, Windows updates**. Edit **Configure Automatic Update**, and set it to **enabled**.
2. In a command prompt, update group policy using **gpupdate /force**.
3. Close and reopen the Windows Update Settings. You will see the above message about your settings being managed by your organization, followed by "We'll automatically download updates, except on metered connections (where charges may apply). In that case, we'll automatically download those updates required to keep Windows running smoothly."
4. Return to gpedit.msc and set the group policy back to **not configured**. Run **gpupdate /force** again.
5. Close the command prompt and wait a few minutes.
6. Reopen the Windows Update Settings. You should not see the message "Some settings are managed by your organization."

Troubleshoot instance launch issues

The following issues prevent you from launching an instance.

Launch Issues

- [Invalid device name](#)
- [Instance limit exceeded](#)
- [Insufficient instance capacity](#)
- [The requested configuration is currently not supported. Please check the documentation for supported configurations.](#)
- [Instance terminates immediately](#)
- [High CPU usage shortly after Windows starts](#)

- [Insufficient permissions](#)

Invalid device name

Description

You get the Invalid device name *device_name* error when you try to launch a new instance.

Cause

If you get this error when you try to launch an instance, the device name specified for one or more volumes in the request has an invalid device name. Possible causes include:

- The device name might be in use by the selected AMI.
- The device name might be reserved for root volumes.
- The device name might be used for another volume in the request.
- The device name might not be valid for the operating system.

Solution

To resolve the issue:

- Ensure that the device name is not used in the AMI that you selected. Run the following command to view the device names used by the AMI.

```
C:\> aws ec2 describe-images --image-id ami_id --query  
'Images[*].BlockDeviceMappings[].DeviceName'
```

- Ensure that you are not using a device name that is reserved for root volumes. For more information, see [Available device names](#).
- Ensure that each volume specified in your request has a unique device name.
- Ensure that the device names that you specified are in the correct format. For more information, see [Available device names](#).

Instance limit exceeded

Description

You get the `InstanceLimitExceeded` error when you try to launch a new instance or restart a stopped instance.

Cause

If you get an `InstanceLimitExceeded` error when you try to launch a new instance or restart a stopped instance, you have reached the limit on the number of instances that you can launch in a Region. When you create your AWS account, we set default limits on the number of instances you can run on a per-Region basis.

Solution

You can request an instance limit increase on a per-region basis. For more information, see [Amazon EC2 service quotas](#).

Insufficient instance capacity

Description

You get the `InsufficientInstanceCapacity` error when you try to launch a new instance or restart a stopped instance.

Cause

If you get this error when you try to launch an instance or restart a stopped instance, AWS does not currently have enough available On-Demand capacity to fulfill your request.

Solution

To resolve the issue, try the following:

- Wait a few minutes and then submit your request again; capacity can shift frequently.
- Submit a new request with a reduced number of instances. For example, if you're making a single request to launch 15 instances, try making 3 requests for 5 instances, or 15 requests for 1 instance instead.

- If you're launching an instance, submit a new request without specifying an Availability Zone.
- If you're launching an instance, submit a new request using a different instance type (which you can resize at a later stage). For more information, see [Change the instance type](#).
- If you are launching instances into a cluster placement group, you can get an insufficient capacity error. For more information, see [Work with placement groups](#).

The requested configuration is currently not supported. Please check the documentation for supported configurations.

Description

You get the Unsupported error when you try to launch a new instance because the instance configuration is not supported.

Cause

The error message provides additional details. For example, an instance type or instance purchasing option might not be supported in the specified Region or Availability Zone.

Solution

Try a different instance configuration. To search for an instance type that meets your requirements, see [Find an Amazon EC2 instance type](#).

Instance terminates immediately

Description

Your instance goes from the pending state to the terminated state.

Cause

The following are a few reasons why an instance might immediately terminate:

- You've exceeded your EBS volume limits. For more information, see [Instance volume limits](#).
- An EBS snapshot is corrupted.
- The root EBS volume is encrypted and you do not have permissions to access the KMS key for decryption.

- A snapshot specified in the block device mapping for the AMI is encrypted and you do not have permissions to access the KMS key for decryption or you do not have access to the KMS key to encrypt the restored volumes.
- The instance store-backed AMI that you used to launch the instance is missing a required part (an image.part.xx file).

For more information, get the termination reason using one of the following methods.

To get the termination reason using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and select the instance.
3. On the first tab, find the reason next to **State transition reason**.

To get the termination reason using the AWS Command Line Interface

1. Use the [describe-instances](#) command and specify the instance ID.

```
aws ec2 describe-instances --instance-id instance_id
```

2. Review the JSON response returned by the command and note the values in the StateReason response element.

The following code block shows an example of a StateReason response element.

```
"StateReason": {  
    "Message": "Client.VolumeLimitExceeded: Volume limit exceeded",  
    "Code": "Server.InternalError"  
},
```

To get the termination reason using AWS CloudTrail

For more information, see [Viewing events with CloudTrail event history](#) in the *AWS CloudTrail User Guide*.

Solution

Depending on the termination reason, take one of the following actions:

- **Client.VolumeLimitExceeded:** **Volume limit exceeded** — Delete unused volumes. You can [submit a request](#) to increase your volume limit.
- **Client.InternalError:** **Client error on launch** — Ensure that you have the permissions required to access the AWS KMS keys used to decrypt and encrypt volumes. For more information, see [Using key policies in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

High CPU usage shortly after Windows starts

If Windows Update is set to **Check for updates but let me choose whether to download and install them** (the default instance setting) this check can consume anywhere from 50 - 99% of the CPU on the instance. If this CPU consumption causes problems for your applications, you can manually change Windows Update settings in **Control Panel** or you can use the following script in the Amazon EC2 user data field:

```
reg add "HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\WindowsUpdate\Auto Update" /v AUOptions /t REG_DWORD /d 3 /f net stop wuauserv net start wuauserv
```

When you run this script, specify a value for /d. The default value is 3. Possible values include the following:

1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

After you modify the user data for your instance, you can run it. For more information, see [View and update the instance user data](#) and [User data execution](#).

Insufficient permissions

Description

You get the "*errorMessage*": "You are not authorized to perform this operation." error when you try to launch a new instance, and the launch fails.

Cause

If you get this error when you try to launch an instance, you don't have the required IAM permissions to launch the instance.

Possible missing permissions include:

- `ec2:RunInstances`
- `iam:PassRole`

Other permissions might also be missing. For the list of permissions required to launch an instance, see the example IAM policies under [Example: Use the EC2 launch instance wizard](#) and [Launch instances \(RunInstances\)](#).

Solution

To resolve the issue:

- If you are making requests as an IAM user, verify that you have the following permissions:
 - `ec2:RunInstances` with a wildcard resource ("*")
 - `iam:PassRole` with the resource matching the role ARN (for example, `arn:aws:iam::999999999999:role/ExampleRoleName`)
- If you don't have the preceding permissions, [edit the IAM policy](#) associated with the IAM role or user to add the missing required permissions.

If your issue is not resolved and you continue receiving a launch failure error, you can decode the authorization failure message included in the error. The decoded message includes the permissions that are missing from the IAM policy. For more information, see [How can I decode an authorization failure message after receiving an "UnauthorizedOperation" error during an EC2 instance launch?](#)

Troubleshoot connecting to your Windows instance

The following are possible problems you might have and error messages you might see while trying to connect to your Windows instance.

Contents

- [Remote Desktop can't connect to the remote computer](#)

- [Error using the macOS RDP client](#)
- [RDP displays a black screen instead of the desktop](#)
- [Unable to remotely log on to an instance with a user that is not an administrator](#)
- [Troubleshooting Remote Desktop issues using AWS Systems Manager](#)
- [Enable Remote Desktop on an EC2 instance with remote registry](#)
- [I've lost my private key. How can I connect to my Windows instance?](#)

Remote Desktop can't connect to the remote computer

Try the following to resolve issues related to connecting to your instance:

- Verify that you're using the correct public DNS hostname. (In the Amazon EC2 console, select the instance and check **Public DNS (IPv4)** in the details pane.) If your instance is in a VPC and you do not see a public DNS name, you must enable DNS hostnames. For more information, see [DNS attributes for your VPC](#) in the *Amazon VPC User Guide*.
- Verify that your instance has a public IPv4 address. If not, you can associate an Elastic IP address with your instance. For more information, see [Elastic IP addresses](#).
- To connect to your instance using an IPv6 address, check that your local computer has an IPv6 address and is configured to use IPv6. If you launched an instance from a Windows Server 2008 SP2 AMI or earlier, your instance is not automatically configured to recognize an IPv6 address assigned to the instance. For more information, see [Configure IPv6 on your instances](#) in the *Amazon VPC User Guide*.
- Verify that your security group has a rule that allows RDP access. For more information, see [Create a security group](#).
- If you copied the password but get the error Your credentials did not work, try typing them manually when prompted. It's possible that you missed a character or got an extra white space character when you copied the password.
- Verify that the instance has passed status checks. For more information, see [Status checks for your instances](#) and [Troubleshoot instances with failed status checks](#) (*Amazon EC2 User Guide for Linux Instances*).
- Verify that the route table for the subnet has a route that sends all traffic destined outside the VPC to the internet gateway for the VPC. For more information, see [Creating a custom route table](#) (*Internet Gateways*) in the *Amazon VPC User Guide*.

- Verify that Windows Firewall, or other firewall software, is not blocking RDP traffic to the instance. We recommend that you disable Windows Firewall and control access to your instance using security group rules. You can use [AWSSupport-TroubleshootRDP](#) to [disable the Windows Firewall profiles using SSM Agent](#). To disable Windows Firewall on a Windows instance that is not configured for AWS Systems Manager, use [AWSSupport-ExecuteEC2Rescue](#), or use the following manual steps:

Manual steps

- Stop the affected instance and detach its root volume.
- Launch a temporary instance in the same Availability Zone as the affected instance.

Warning

If your temporary instance is based on the same AMI that the original instance is based on, you must complete additional steps or you won't be able to boot the original instance after you restore its root volume because of a disk signature collision. Alternatively, select a different AMI for the temporary instance. For example, if the original instance uses the AWS Windows AMI for Windows Server 2008 R2, launch the temporary instance using the AWS Windows AMI for Windows Server 2012.

- Attach the root volume from the affected instance to this temporary instance. Connect to the temporary instance, open the **Disk Management** utility, and bring the drive online.
- Open **Regedit** and select **HKEY_LOCAL_MACHINE**. From the **File** menu, choose **Load Hive**. Select the drive, open the file `Windows\System32\config\SYSTEM`, and specify a key name when prompted (you can use any name).
- Select the key you just loaded and navigate to `ControlSet001\Services\SharedAccess\Parameters\FirewallPolicy`. For each key with a name of the form `xxxxProfile`, select the key and change `EnableFirewall` from 1 to 0. Select the key again, and from the **File** menu, choose **Unload Hive**.
- (Optional) If your temporary instance is based on the same AMI that the original instance is based on, you must complete the following steps or you won't be able to boot the original instance after you restore its root volume because of a disk signature collision.

⚠️ Warning

The following procedure describes how to edit the Windows Registry using Registry Editor. If you are not familiar with the Windows Registry or how to safely make changes using Registry Editor, see [Configure the Registry](#).

- a. Open a command prompt, type **regedit.exe**, and press Enter.
- b. In the **Registry Editor**, choose **HKEY_LOCAL_MACHINE** from the context menu (right-click), and then choose **Find**.
- c. Type **Windows Boot Manager** and then choose **Find Next**.
- d. Choose the key named **11000001**. This key is a sibling of the key you found in the previous step.
- e. In the right pane, choose **Element** and then choose **Modify** from the context menu (right-click).
- f. Locate the four-byte disk signature at offset **0x38** in the data. Reverse the bytes to create the disk signature, and write it down. For example, the disk signature represented by the following data is **E9EB3AA5**:

```
...
0030  00 00 00 00 01 00 00 00
0038  A5 3A EB E9 00 00 00 00
0040  00 00 00 00 00 00 00 00
...
...
```

- g. In a Command Prompt window, run the following command to start Microsoft DiskPart.

```
diskpart
```

- h. Run the following DiskPart command to select the volume. (You can verify that the disk number is 1 using the **Disk Management** utility.)

```
DISKPART> select disk 1
```

```
Disk 1 is now the selected disk.
```

- i. Run the following DiskPart command to get the disk signature.

```
DISKPART> uniqueid disk
```

```
Disk ID: 0C764FA8
```

- j. If the disk signature shown in the previous step doesn't match the disk signature from BCD that you wrote down earlier, use the following DiskPart command to change the disk signature so that it matches:

```
DISKPART> uniqueid disk id=E9EB3AA5
```

7. Using the **Disk Management** utility, bring the drive offline.

 **Note**

The drive is automatically offline if the temporary instance is running the same operating system as the affected instance, so you won't need to bring it offline manually.

8. Detach the volume from the temporary instance. You can terminate the temporary instance if you have no further use for it.
9. Restore the root volume of the affected instance by attaching it as /dev/sda1.
10. Start the instance.

- Verify that Network Level Authentication is disabled on instances that are not part of an Active Directory domain (use [AWSSupport-TroubleshootRDP](#) to [disable NLA](#)).
- Verify that the Remote Desktop Service (TermService) Startup Type is Automatic and the service is started (use [AWSSupport-TroubleshootRDP](#) to [enable and start the RDP service](#)).
- Verify that you are connecting to the correct Remote Desktop Protocol port, which by default is 3389 (use [AWSSupport-TroubleshootRDP](#) to [read the current RDP port](#) and [change it back to 3389](#)).
- Verify that Remote Desktop connections are allowed on your instance (use [AWSSupport-TroubleshootRDP](#) to [enable Remote Desktop connections](#)).
- Verify that the password has not expired. If the password has expired, you can reset it. For more information, see [Reset a lost or expired Windows administrator password](#).

- If you attempt to connect using a user that you created on the instance and receive the error The user cannot connect to the server due to insufficient access privileges, verify that you granted the user the right to log on locally. For more information, see [Grant a Member the Right to Logon Locally](#).
- If you attempt more than the maximum allowed concurrent RDP sessions, your session is terminated with the message Your Remote Desktop Services session has ended. Another user connected to the remote computer, so your connection was lost. By default, you are allowed two concurrent RDP sessions to your instance.

Error using the macOS RDP client

If you are connecting to a Windows Server 2012 R2 instance using the Remote Desktop Connection client from the Microsoft website, you may get the following error:

Remote Desktop Connection cannot verify the identity of the computer that you want to connect to.

Download the Microsoft Remote Desktop app from the Mac App Store and use the app to connect to your instance.

RDP displays a black screen instead of the desktop

Try the following to resolve this issue:

- Check the console output for additional information. To get the console output for your instance using the Amazon EC2 console, select the instance, and then choose **Actions, Monitor and troubleshoot, Get system log**.
- Verify that you are running the latest version of your RDP client.
- Try the default settings for the RDP client. For more information, see [Remote Session Environment](#).
- If you are using Remote Desktop Connection, try starting it with the /admin option as follows.

```
mstsc /v:instance /admin
```

- If the server is running a full-screen application, it might have stopped responding. Use Ctrl +Shift+Esc to start Windows Task Manager, and then close the application.

- If the server is over-utilized, it might have stopped responding. To monitor the instance using the Amazon EC2 console, select the instance and then select the **Monitoring** tab. If you need to change the instance type to a larger size, see [Change the instance type](#).

Unable to remotely log on to an instance with a user that is not an administrator

If you are not able to remotely log on to a Windows instance with a user that is not an administrator account, ensure that you have granted the user the right to log on locally. See [Grant a user or group the right to log on locally to the domain controllers in the domain](#).

Troubleshooting Remote Desktop issues using AWS Systems Manager

You can use AWS Systems Manager to troubleshoot issues connecting to your Windows instance using RDP.

AWSSupport-TroubleshootRDP

The AWSSupport-TroubleshootRDP automation document allows the user to check or modify common settings on the target instance that can impact Remote Desktop Protocol (RDP) connections, such as the **RDP Port**, **Network Layer Authentication (NLA)**, and **Windows Firewall** profiles. By default, the document reads and outputs the values of these settings.

The AWSSupport-TroubleshootRDP automation document can be used with EC2 instances, on-premises instances, and virtual machines (VMs) that are enabled for use with AWS Systems Manager (managed instances). In addition, it can also be used with EC2 instances for Windows Server that are *not* enabled for use with Systems Manager. For information about enabling instances for use with AWS Systems Manager, see [Managed nodes](#) in the *AWS Systems Manager User Guide*.

To troubleshoot using the AWSSupport-TroubleshootRDP document

- Log in to the [Systems Manager Console](#).
- Verify that you are in the same Region as the impaired instance.
- Choose **Documents** from the left navigation pane.
- On the **Owned by Amazon** tab, enter AWSSupport-TroubleshootRDP in the search field. When the AWSSupport-TroubleshootRDP document appears, select it.

5. Choose **Execute automation**.
6. For **Execution Mode**, choose **Simple execution**.
7. For **Input parameters**, **InstanceId**, enable **Show interactive instance picker**.
8. Choose your Amazon EC2 instance.
9. Review the [examples](#), then choose **Execute**.
10. To monitor the execution progress, for **Execution status**, wait for the status to change from **Pending** to **Success**. Expand **Outputs** to view the results. To view the output of individual steps, in **Executed Steps**, choose an item from **Step ID**.

AWSSupport-TroubleshootRDP examples

The following examples show you how to accomplish common troubleshooting tasks using AWSSupport-TroubleshootRDP. You can use either the example AWS CLI [start-automation-execution](#) command or the provided link to the AWS Management Console.

Example Example: Check the current RDP status

AWS CLI:

```
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP" --parameters "InstanceId=instance_id, Action=Custom" --region region_code
```

AWS Systems Manager console:

```
https://console.aws.amazon.com/systems-manager/automation/execute/AWSSupport-TroubleshootRDP?region=region#documentVersion=$LATEST
```

Example Example: Disable the Windows Firewall

AWS CLI:

```
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP" --parameters "InstanceId=instance_id, Action=Custom, Firewall=Disable" --region region_code
```

AWS Systems Manager console:

```
https://console.aws.amazon.com/systems-manager/automation/execute/AWSSupport-TroubleshootRDP?region=region_code#documentVersion=$LATEST&Firewall=Disable
```

Example Example: Disable Network Level Authentication

AWS CLI:

```
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP" --parameters "InstanceId=instance_id, Action=Custom, NLASettingAction=Disable" --region region_code
```

AWS Systems Manager console:

```
https://console.aws.amazon.com/systems-manager/automation/execute/AWSSupport-TroubleshootRDP?region=region_code#documentVersion
```

Example Example: Set RDP Service Startup Type to Automatic and start the RDP service

AWS CLI:

```
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP" --parameters "InstanceId=instance_id, Action=Custom, RDPServiceStartupType=Auto, RDPServiceAction=Start" --region region_code
```

AWS Systems Manager console:

```
https://console.aws.amazon.com/systems-manager/automation/execute/AWSSupport-TroubleshootRDP?region=region_code#documentVersion=$LATEST&RDPServiceStartupType=Auto&RDPServiceAction=Start
```

Example Example: Restore the default RDP Port (3389)

AWS CLI:

```
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP" --parameters "InstanceId=instance_id, Action=Custom, RDPPortAction=Modify" --region region_code
```

AWS Systems Manager console:

[https://console.aws.amazon.com/systems-manager/automation/execute/AWSSupport-TroubleshootRDP?region=region_code#documentVersion=\\$LATEST&RDPPortAction=Modify](https://console.aws.amazon.com/systems-manager/automation/execute/AWSSupport-TroubleshootRDP?region=region_code#documentVersion=$LATEST&RDPPortAction=Modify)

Example Example: Allow remote connections

AWS CLI:

```
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP"  
--parameters "InstanceId=instance_id, Action=Custom, RemoteConnections=Enable" --  
region region_code
```

AWS Systems Manager console:

[https://console.aws.amazon.com/systems-manager/automation/execute/AWSSupport-TroubleshootRDP?region=region_code#documentVersion=\\$LATEST&RemoteConnections=Enable](https://console.aws.amazon.com/systems-manager/automation/execute/AWSSupport-TroubleshootRDP?region=region_code#documentVersion=$LATEST&RemoteConnections=Enable)

AWSSupport-ExecuteEC2Rescue

The AWSSupport-ExecuteEC2Rescue automation document uses [Use EC2Rescue for Windows Server](#) to automatically troubleshoot and restore EC2 instance connectivity and RDP issues. For more information, see [Run the EC2Rescue tool on unreachable instances](#).

The AWSSupport-ExecuteEC2Rescue automation document requires a stop and restart of the instance. Systems Manager Automation stops the instance and creates an Amazon Machine Image (AMI). Data stored in instance store volumes is lost. The public IP address changes if you are not using an Elastic IP address. For more information, see [Run the EC2Rescue tool on unreachable instances](#) in the *AWS Systems Manager User Guide*.

To troubleshoot using the AWSSupport-ExecuteEC2Rescue document

1. Open the [Systems Manager console](#).
2. Verify that you are in the same Region as the impaired Amazon EC2 instance.
3. In the navigation panel, choose **Documents**.
4. Search for and select the AWSSupport-ExecuteEC2Rescue document, and then choose **Execute automation**.
5. In **Execution Mode**, choose **Simple execution**.
6. In the **Input parameters** section, for **UnreachableInstanceId**, enter the Amazon EC2 instance ID of the unreachable instance.

7. (Optional) For **LogDestination**, enter the Amazon Simple Storage Service (Amazon S3) bucket name if you want to collect operating system logs for troubleshooting your Amazon EC2 instance. Logs are automatically uploaded to the specified bucket.
8. Choose **Execute**.
9. To monitor the execution progress, in **Execution status**, wait for the status to change from **Pending** to **Success**. Expand **Outputs** to view the results. To view the output of individual steps, in **Executed Steps**, choose the **Step ID**.

Enable Remote Desktop on an EC2 instance with remote registry

If your unreachable instance is not managed by AWS Systems Manager Session Manager, then you can use remote registry to enable Remote Desktop.

1. From the EC2 console, stop the unreachable instance.
2. Detach the root volume of the unreachable instance and attach it to a reachable instance in the same Availability Zone as a storage volume. If you don't have a reachable instance in the same Availability Zone, launch one. Note the device name of the root volume on the unreachable instance.
3. On the reachable instance, open Disk Management. You can do so by running the following command in the Command Prompt window.

```
diskmgmt.msc
```

4. Right click the newly attached volume that came from the unreachable instance, and then choose **Online**.
5. Open the Windows Registry Editor. You can do so by running the following command in the Command Prompt window.

```
regedit
```

6. In Registry Editor, choose **HKEY_LOCAL_MACHINE**, then select **File, Load Hive**.
7. Select the drive of the attached volume, navigate to **\Windows\System32\config**, select **SYSTEM**, and then choose **Open**.
8. For **Key Name**, enter a unique name for the hive and choose **OK**.
9. Back up the registry hive before making any changes to the registry.

- a. In the Registry Editor console tree, select the hive that you loaded:
HKEY_LOCAL_MACHINE\your-key-name.
 - b. Choose **File, Export**.
 - c. In the Export Registry File dialog box, choose the location to which you want to save the backup copy, and then type a name for the backup file in the **File name** field.
 - d. Choose **Save**.
10. In Registry Editor, navigate to **HKEY_LOCAL_MACHINE\your key name\ControlSet001\Control\Terminal Server**, and then, in the details pane, double-click **fDenyTSConnections**.
 11. In the **Edit DWORD** value box, enter **0** in the **Value data** field.
 12. Choose **OK**.

 **Note**

If the value in the **Value data** field is **1**, then the instance will deny remote desktop connections. A value of **0** allows remote desktop connections.

13. In Registry Editor, choose **HKEY_LOCAL_MACHINE\your-key-name**, then select **File, Unload Hive**.
14. Close Registry Editor and Disk Management.
15. From the EC2 console, detach the volume from the reachable instance and then reattach it to the unreachable instance. When attaching the volume to the unreachable instance, enter the device name that you saved earlier in the **device** field.
16. Restart the unreachable instance.

I've lost my private key. How can I connect to my Windows instance?

When you connect to a newly-launched Windows instance, you decrypt the password for the Administrator account using the private key for the key pair that you specified when you launched the instance.

If you lose the Administrator password and you no longer have the private key, you must reset the password or create a new instance. For more information, see [Reset a lost or expired Windows administrator password](#). For steps to reset the password using an Systems Manager document, see [Reset passwords and SSH keys on EC2 instances](#) in the *AWS Systems Manager User Guide*.

Troubleshoot an unreachable instance

You can use the following methods to troubleshoot an unreachable Windows instance. For information about troubleshooting an unreachable Linux instance, see [Troubleshoot an unreachable instance](#) in the *EC2 User Guide for Linux*.

Contents

- [Instance reboot](#)
- [Instance console output](#)
- [Capture a screenshot of an unreachable instance](#)
- [Common screenshots](#)
- [Instance recovery when a host computer fails](#)

Instance reboot

The ability to reboot instances that are otherwise unreachable is valuable for both troubleshooting and general instance management.

Just as you can reset a computer by pressing the reset button, you can reset EC2 instances using the Amazon EC2 console, CLI, or API. For more information, see [Reboot your instance](#).

Instance console output

Console output is a valuable tool for problem diagnosis. It is especially useful for troubleshooting kernel problems and service configuration issues that could cause an instance to terminate or become unreachable before its SSH daemon can be started.

For Windows instances, the instance console output includes the last three system event log errors.

You can optionally retrieve the latest serial console output at any time during the instance lifecycle. This option is only supported on [instances built on the AWS Nitro System](#). It is not supported through the Amazon EC2 console.

 **Note**

Only the most recent 64 KB of posted output is stored, which is available for at least 1 hour after the last posting.

Only the instance owner can access the console output.

Use one of the following methods to get console output.

Console

To get console output

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instances**.
3. Select the instance and then choose **Actions, Monitor and troubleshoot, Get system log**.

Command line

To get console output

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [get-console-output](#) (AWS CLI)
- [Get-EC2ConsoleOutput](#) (AWS Tools for Windows PowerShell)

Capture a screenshot of an unreachable instance

If you are unable to reach your instance via RDP, you can capture a screenshot of your instance and view it as an image. The image can provide visibility as to the status of the instance, and allows for quicker troubleshooting. You can also use [EC2 Rescue](#) on instances running Windows Server 2008 or later to gather and analyze data from offline instances.

You can generate screenshots while the instance is running or after it has crashed. The image is generated in JPG format and is no larger than 100 kb. There is no data transfer cost for the screenshot.

Limitations

This feature is not supported for the following:

- Bare metal instances (instances of type *.`.metal`)
- Instance is using an NVIDIA GRID driver

- Instances powered by Arm-based Graviton processors

Supported Regions

This feature is available in the following Regions:

- US East (N. Virginia) Region
- US East (Ohio) Region
- US West (N. California) Region
- US West (Oregon) Region
- Africa (Cape Town) Region
- Asia Pacific (Hong Kong) Region
- Asia Pacific (Hyderabad) Region
- Asia Pacific (Jakarta) Region
- Asia Pacific (Melbourne) Region
- Asia Pacific (Mumbai) Region
- Asia Pacific (Osaka) Region
- Asia Pacific (Seoul) Region
- Asia Pacific (Singapore) Region
- Asia Pacific (Sydney) Region
- Asia Pacific (Tokyo) Region
- Canada (Central) Region
- Canada West (Calgary) Region
- China (Beijing) Region
- China (Ningxia) Region
- Europe (Frankfurt) Region
- Europe (Ireland) Region
- Europe (London) Region
- Europe (Milan) Region
- Europe (Paris) Region
- Europe (Spain) Region
- Europe (Stockholm) Region

- Europe (Zurich) Region
- Israel (Tel Aviv) Region
- South America (São Paulo) Region
- Middle East (Bahrain) Region
- Middle East (UAE) Region

Console

To get a screenshot of an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instances**.
3. Select the instance to capture.
4. Choose **Actions, Monitor and troubleshoot, Get instance screenshot**.
5. Choose **Download**, or right-click the image to download and save it.

Command line

To capture a screenshot of an instance

You can use one of the following commands. The returned content is base64-encoded. For more information about these command line interfaces, see [Access Amazon EC2](#).

- [get-console-screenshot](#) (AWS CLI)
- [GetConsoleScreenshot](#) (Amazon EC2 Query API)

Common screenshots

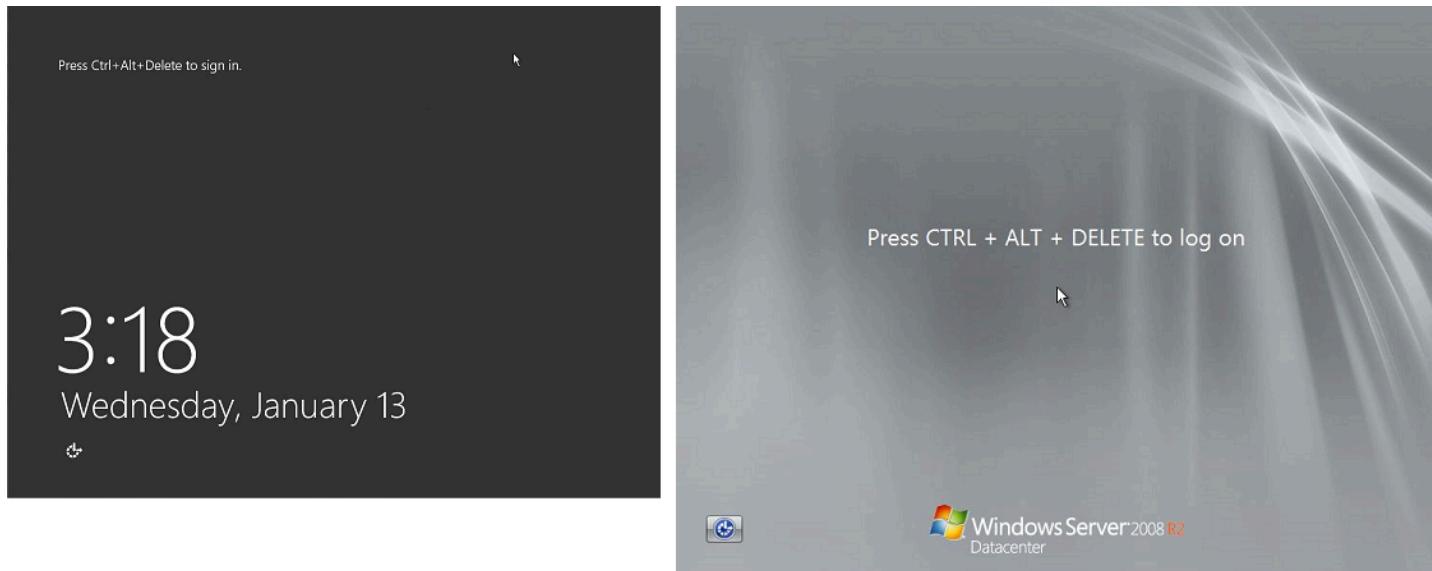

You can use the following information to help you troubleshoot an unreachable Windows instance based on screenshots returned by the service.

- [Log on screen \(Ctrl+Alt+Delete\)](#)
- [Recovery console screen](#)
- [Windows boot manager screen](#)
- [Sysprep screen](#)

- [Getting ready screen](#)
- [Windows Update screen](#)
- [Chkdsk](#)

Log on screen (Ctrl+Alt+Delete)

Console Screenshot Service returned the following.

If an instance becomes unreachable during logon, there could be a problem with your network configuration or Windows Remote Desktop Services. An instance can also be unresponsive if a process is using large amounts of CPU.

Network configuration

Use the following information to verify that your AWS, Microsoft Windows, and local (or on-premises) network configurations aren't blocking access to the instance.

AWS network configuration

Configuration	Verify
Security group configuration	Verify that port 3389 is open for your security group. Verify you are connecting to the right public IP address. If the instance was not associated with an Elastic IP, the public IP changes after the instance stops/starts. For

Configuration	Verify
	<p>more information, see Remote Desktop can't connect to the remote computer.</p>
VPC configuration (Network ACLs)	<p>Verify that the access control list (ACL) for your Amazon VPC is not blocking access. For information, see Network ACLs in the <i>Amazon VPC User Guide</i>.</p>
VPN configuration	<p>If you are connecting to your VPC using a virtual private network (VPN), verify VPN tunnel connectivity. For more information, see How do I troubleshoot VPN tunnel connectivity to an Amazon VPC?</p>

Windows network configuration

Configuration	Verify
Windows Firewall	<p>Verify that Windows Firewall isn't blocking connections to your instance. Disable Windows Firewall as described in bullet 7 of the remote desktop troubleshooting section, Remote Desktop can't connect to the remote computer.</p>
Advanced TCP/IP configuration (Use of static IP)	<p>The instance may be unresponsive because you configured a static IP address. For a VPC, create a network interface and attach it to the instance.</p>

Local or on-premises network configuration

Verify that a local network configuration isn't blocking access. Try to connect to another instance in the same VPC as your unreachable instance. If you can't access another instance, work with your local network administrator to determine whether a local policy is restricting access.

Remote Desktop Services issues

If the instance can't be reached during logon, there could a problem with Remote Desktop Services (RDS) on the instance.

Tip

You can use the `AWSsupport-TroubleshootRDP` runbook to check and modify various settings that might affect Remote Desktop Protocol (RDP) connections. For more information, see [AWSsupport-TroubleshootRDP](#) in the *AWS Systems Manager Automation runbook reference*.

Remote Desktop Services configuration

Configuration	Verify
RDS is running	Verify that RDS is running on the instance. Connect to the instance using the Microsoft Management Console (MMC) Services snap-in (<code>services.msc</code>). In the list of services, verify that Remote Desktop Services is Running . If it isn't, start it and then set the startup type to Automatic . If you can't connect to the instance by using the Services snap-in, detach the root volume from the instance, take a snapshot of the volume or create an AMI from it, attach the original volume to another instance in the same Availability Zone as a secondary volume, and modify the Start registry key. When you are finished, reattach the root volume to the original instance.
RDS is enabled	Even if the service is started, it might be disabled. Detach the root volume from the instance, take a snapshot of the volume or create an AMI from it, attach the original volume to another instance in the same Availability Zone as a secondary volume, and enable the service by modifying the Terminal Server registry key as described in Enable Remote Desktop on an EC2 instance with remote registry .

Configuration	Verify
	When you are finished, reattach the root volume to the original instance.

High CPU usage

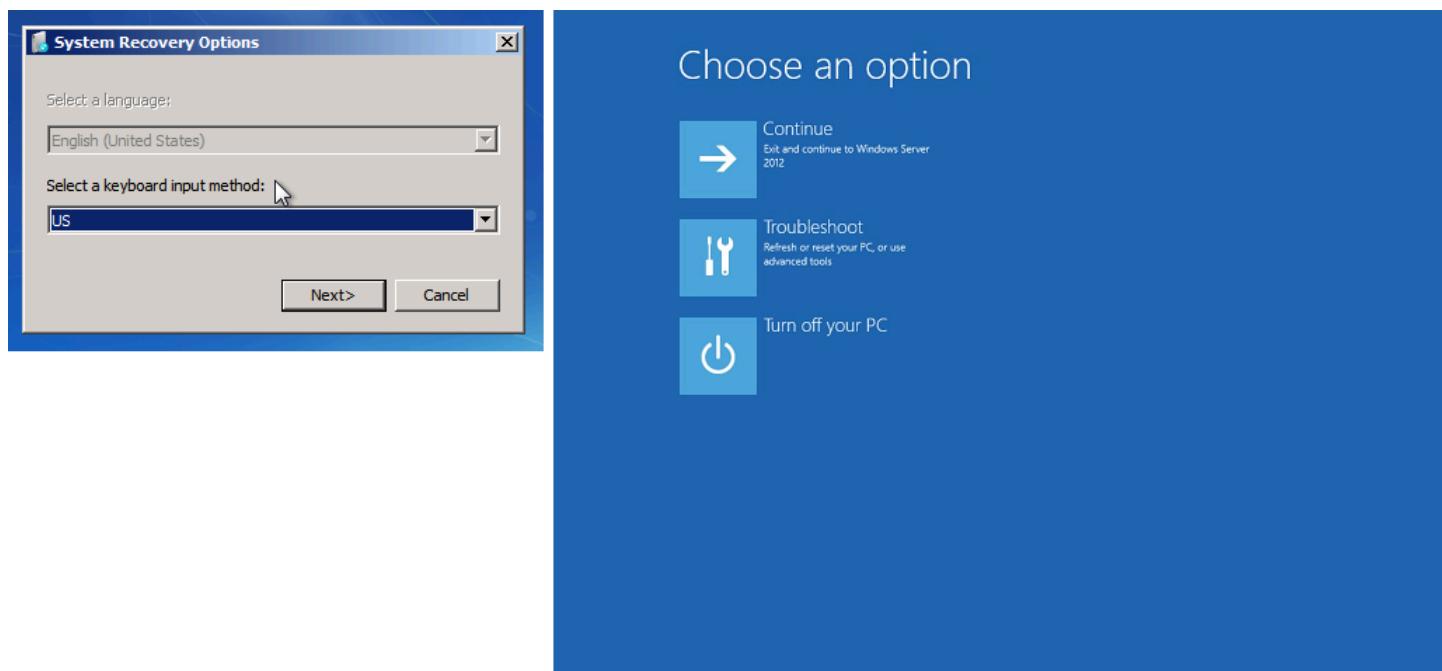

Check the **CPUUtilization (Maximum)** metric on your instance by using Amazon CloudWatch. If **CPUUtilization (Maximum)** is a high number, wait for the CPU to go down and try connecting again. High CPU usage can be caused by:

- Windows Update
- Security Software Scan
- Custom Startup Script
- Task Scheduler

For more information, see [Get Statistics for a Specific Resource](#) in the *Amazon CloudWatch User Guide*. For additional troubleshooting tips, see [High CPU usage shortly after Windows starts](#).

Recovery console screen

Console Screenshot Service returned the following.

The operating system might boot into the Recovery console and get stuck in this state if the `bootstatuspolicy` is not set to `ignoreallfailures`. Use the following procedure to change the `bootstatuspolicy` configuration to `ignoreallfailures`.

By default, the policy configuration for public Windows AMIs provided by AWS is set to `ignoreallfailures`.

1. Stop the unreachable instance.
2. Create a snapshot of the root volume. The root volume is attached to the instance as `/dev/sda1`.

Detach the root volume from the unreachable instance, take a snapshot of the volume or create an AMI from it, and attach it to another instance in the same Availability Zone as a secondary volume.

Warning

If your temporary instance and the original instance were launched using the same AMI, you must complete additional steps or you won't be able to boot the original instance after you restore its root volume because of a disk signature collision. If you must create a temporary instance using the same AMI, to avoid a disk signature collision, complete the steps in [Disk signature collision](#).

Alternatively, select a different AMI for the temporary instance. For example, if the original instance uses an AMI for Windows Server 2008 R2, launch the temporary instance using an AMI for Windows Server 2012.

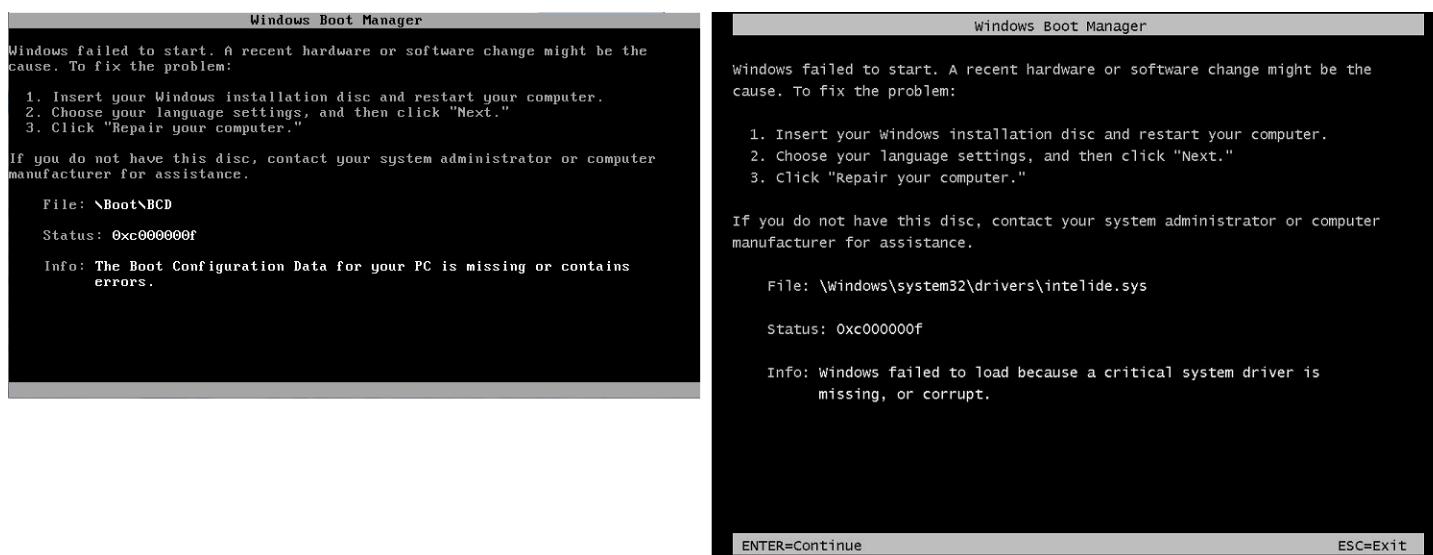

3. Log in to the instance and run the following command from a command prompt to change the `bootstatuspolicy` configuration to `ignoreallfailures`.

```
bcdeedit /store Drive Letter:\boot\bcd /set {default} bootstatuspolicy  
ignoreallfailures
```

4. Reattach the volume to the unreachable instance and start the instance again.

Windows boot manager screen

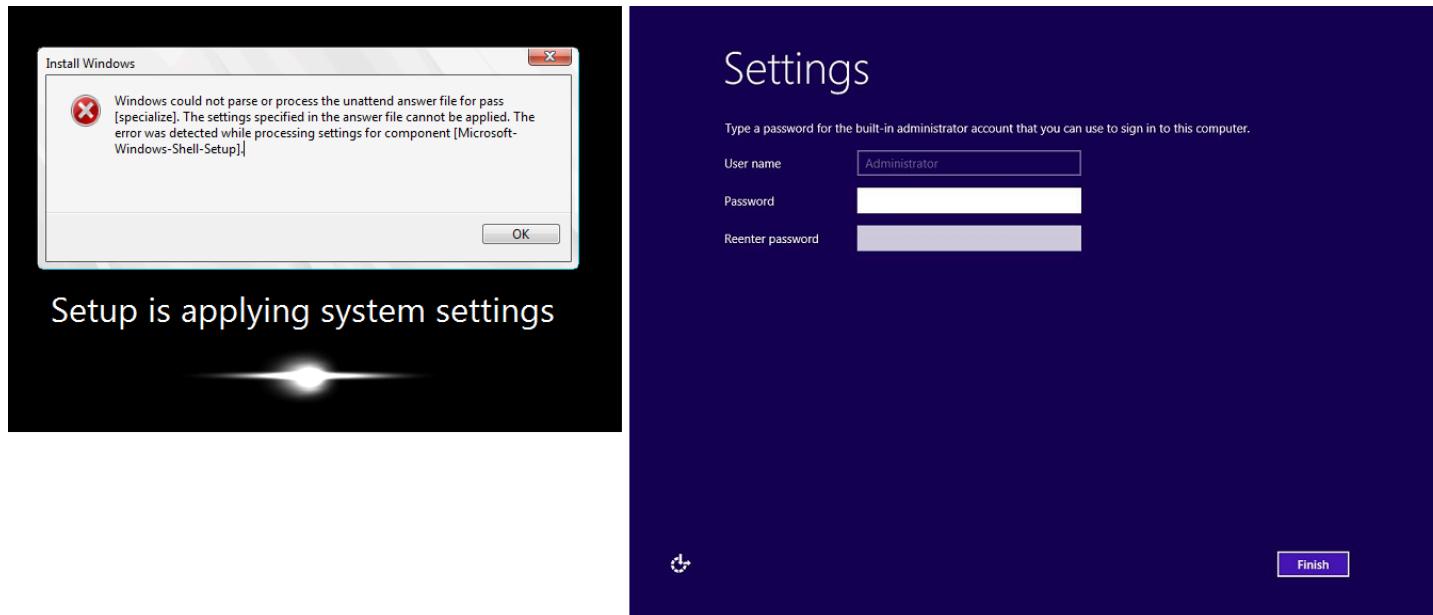

Console Screenshot Service returned the following.

The operating system experienced a fatal corruption in the system file and/or the registry. When the instance is stuck in this state, you should recover the instance from a recent backup AMI or launch a replacement instance. If you need to access data on the instance, detach any root volumes from the unreachable instance, take a snapshot of those volume or create an AMI from them, and attach them to another instance in the same Availability Zone as a secondary volume.

Sysprep screen

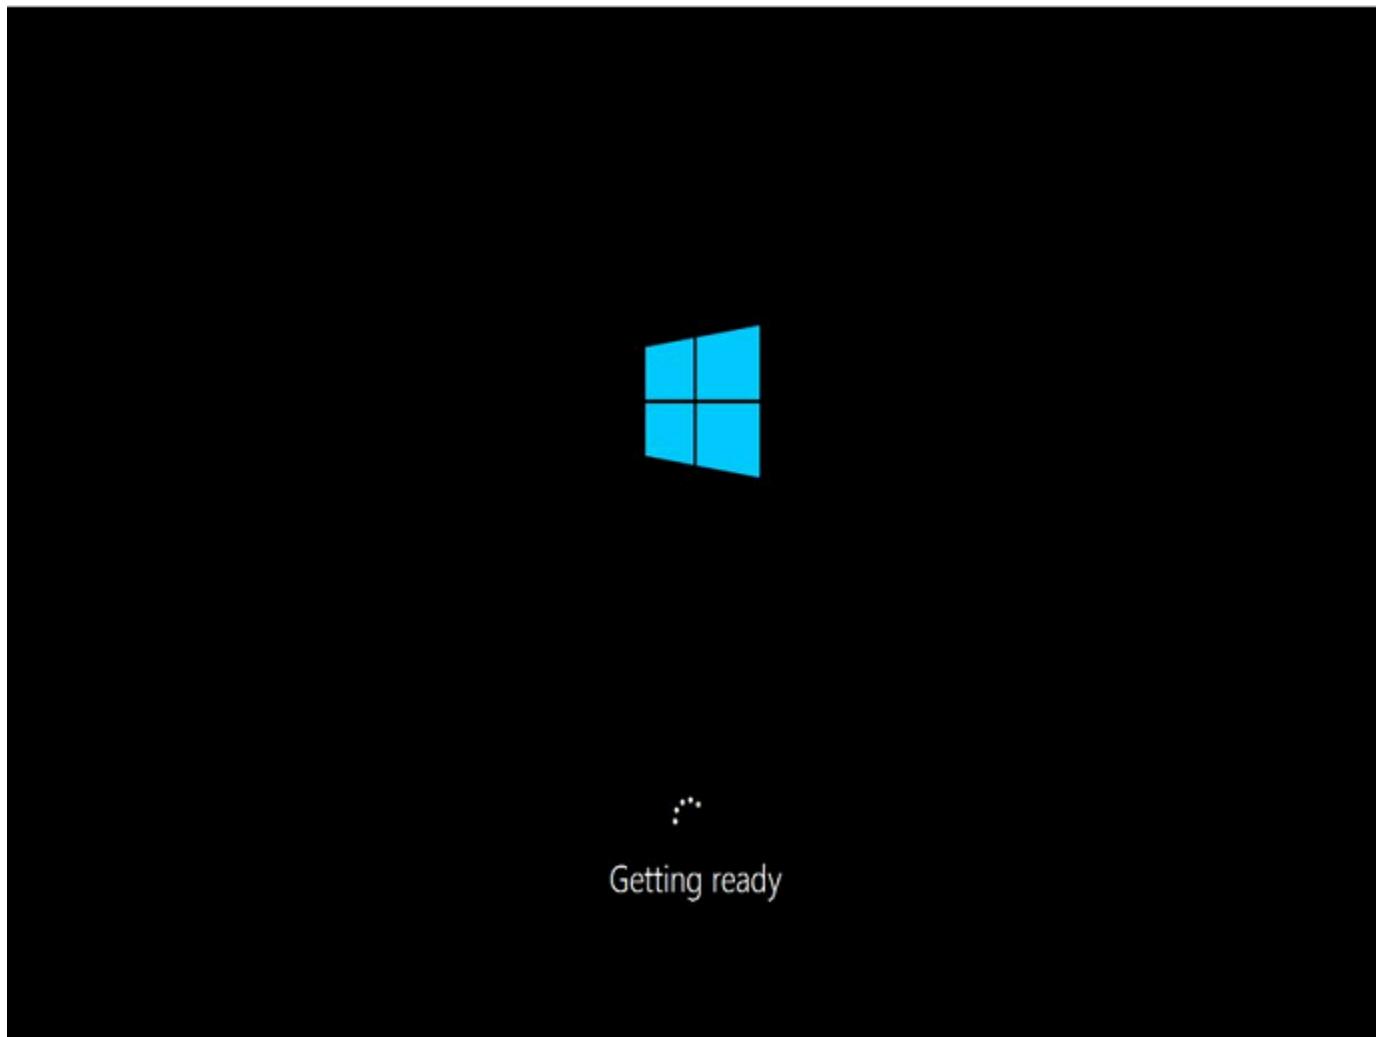

Console Screenshot Service returned the following.

You may see this screen if you did not use the EC2Config Service to call Sysprep or if the operating system failed while running Sysprep. You can reset the password using [EC2Rescue](#). Otherwise, [Create a standardized Amazon Machine Image \(AMI\) using Sysprep](#).

Getting ready screen

Console Screenshot Service returned the following.

Refresh the Instance Console Screenshot Service repeatedly to verify that the progress ring is spinning. If the ring is spinning, wait for the operating system to start up. You can also check the **CPUUtilization (Maximum)** metric on your instance by using Amazon CloudWatch to see if the operating system is active. If the progress ring is not spinning, the instance may be stuck at the boot process. Reboot the instance. If rebooting does not solve the problem, recover the instance from a recent backup AMI or launch a replacement instance. If you need to access data on the instance, detach the root volume from the unreachable instance, take a snapshot of the volume

or create an AMI from it. Then attach it to another instance in the same Availability Zone as a secondary volume.

Windows Update screen

Console Screenshot Service returned the following.

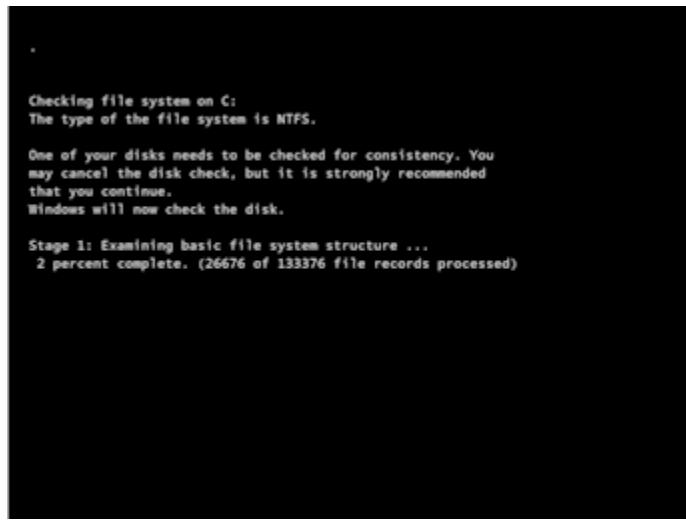

The Windows Update process is updating the registry. Wait for the update to finish. Do not reboot or stop the instance as this may cause data corruption during the update.

Note

The Windows Update process can consume resources on the server during the update. If you experience this problem often, consider using faster instance types and faster EBS volumes.

Chkdsk

Console Screenshot Service returned the following.

Windows is running the chkdsk system tool on the drive to verify file system integrity and fix logical file system errors. Wait for process to complete.

Instance recovery when a host computer fails

If there is an unrecoverable issue with the hardware of an underlying host computer, AWS may schedule an instance stop event. You are notified of such an event ahead of time by email.

To recover an Amazon EBS-backed instance running on a host computer that failed

1. Back up any important data on your instance store volumes to Amazon EBS or Amazon S3.
2. Stop the instance.
3. Start the instance.
4. Restore any important data.

For more information, see [Stop and start Amazon EC2 instances](#).

To recover an instance store-backed instance running on a host computer that failed

1. Create an AMI from the instance.
2. Upload the image to Amazon S3.
3. Back up important data to Amazon EBS or Amazon S3.
4. Terminate the instance.
5. Launch a new instance from the AMI.
6. Restore any important data to the new instance.

Reset a lost or expired Windows administrator password

If you are no longer able to access your Windows Amazon EC2 instance because the Windows administrator password is lost or expired, you can reset the password.

Note

There is an AWS Systems Manager Automation document that automatically applies the manual steps necessary to reset the local administrator password. For more information, see [Reset passwords and SSH keys on EC2 instances](#) in the *AWS Systems Manager User Guide*.

The manual methods to reset the administrator password use EC2Launch v2, EC2Config, or EC2Launch.

- For all supported Windows AMIs that include the EC2Launch v2 agent, use EC2Launch v2.
- For Windows AMIs before Windows Server 2016, use the EC2Config service.
- For Windows Server 2016 and later AMIs, use the EC2Launch service.

These procedures also describe how to connect to an instance if you lost the key pair that was used to create the instance. Amazon EC2 uses a public key to encrypt a piece of data, such as a password, and a private key to decrypt the data. The public and private keys are known as a *key pair*. With Windows instances, you use a key pair to obtain the administrator password and then log in using RDP.

Note

If you have disabled the local administrator account on the instance and your instance is configured for Systems Manager, you can also re-enable and reset your local administrator password by using EC2Rescue and Run Command. For more information, see [Using EC2Rescue for Windows Server with Systems Manager Run Command](#).

Contents

- [Reset the Windows administrator password using EC2Launch v2](#)

- [Reset the Windows administrator password using EC2Config](#)
- [Reset the Windows administrator password using EC2Launch](#)

Reset the Windows administrator password using EC2Launch v2

If you have lost your Windows administrator password and are using a supported Windows AMI that includes the EC2Launch v2 agent, you can use EC2Launch v2 to generate a new password.

If you are using a Windows Server 2016 or later AMI that does not include the EC2Launch v2 agent, see [Reset the Windows administrator password using EC2Launch](#).

If you are using a Windows Server AMI earlier than Windows Server 2016 that does not include the EC2Launch v2 agent, see [Reset the Windows administrator password using EC2Config](#).

Note

If you have disabled the local administrator account on the instance and your instance is configured for Systems Manager, you can also re-enable and reset your local administrator password by using EC2Rescue and Run Command. For more information, see [Using EC2Rescue for Windows Server with Systems Manager Run Command](#).

Note

There is an AWS Systems Manager Automation document that automatically applies the manual steps necessary to reset the local administrator password. For more information, see [Reset passwords and SSH keys on EC2 instances](#) in the *AWS Systems Manager User Guide*.

To reset your Windows administrator password using EC2Launch v2, you need to do the following:

- [Step 1: Verify that the EC2Launch v2 agent is running](#)
- [Step 2: Detach the root volume from the instance](#)
- [Step 3: Attach the volume to a temporary instance](#)
- [Step 4: Delete the .run-once file](#)
- [Step 5: Restart the original instance](#)

Step 1: Verify that the EC2Launch v2 agent is running

Before you attempt to reset the administrator password, verify that the EC2Launch v2 agent is installed and running. You use the EC2Launch v2 agent to reset the administrator password later in this section.

To verify that the EC2Launch v2 agent is running

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and then select the instance that requires a password reset. This instance is referred to as the *original* instance in this procedure.
3. Choose **Actions, Monitor and troubleshoot, Get system log**.
4. Locate the EC2 Launch entry, for example, **Launch: EC2Launch v2 service v2.0.124**. If you see this entry, the EC2Launch v2 service is running.

If the system log output is empty, or if the EC2Launch v2 agent is not running, troubleshoot the instance using the Instance Console Screenshot service. For more information, see [Capture a screenshot of an unreachable instance](#).

Step 2: Detach the root volume from the instance

You can't use EC2Launch v2 to reset an administrator password if the volume on which the password is stored is attached to an instance as the root volume. You must detach the volume from the original instance before you can attach it to a temporary instance as a secondary volume.

To detach the root volume from the instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance that requires a password reset and choose **Actions, Instance state, Stop instance**. After the status of the instance changes to **Stopped**, continue with the next step.
4. (Optional) If you have the private key that you specified when you launched this instance, continue with the next step. Otherwise, use the following steps to replace the instance with a new instance that you launch with a new key pair.
 - a. Create a new key pair using the Amazon EC2 console. To give your new key pair the same name as the one for which you lost the private key, you must first delete the existing key pair.

- b. Select the instance to replace. Note the instance type, VPC, subnet, security group, and IAM role of the instance.
 - c. Choose **Actions, Image and templates, Create image**. Type a name and a description for the image and choose **Create image**. In the navigation pane, choose **AMIs**. After the image status changes to **available**, continue to the next step.
 - d. Select the image and choose **Actions**, and then **Launch**.
 - e. Complete the wizard, selecting the same instance type, VPC, subnet, security group, and IAM role as the instance to replace, and then choose **Launch**.
 - f. When prompted, choose the key pair that you created for the new instance, select the acknowledgement check box, and then choose **Launch Instances**.
 - g. (Optional) If the original instance has an associated Elastic IP address, transfer it to the new instance. If the original instance has EBS volumes in addition to the root volume, transfer them to the new instance.
5. Detach the root volume from the original instance as follows:
 - a. In the **Description** pane of the original instance, note the ID of the EBS volume listed as the **Root device**.
 - b. In the navigation pane, choose **Volumes**.
 - c. In the list of volumes, select the volume noted in the previous step, and choose **Actions, Detach Volume**. After the volume status changes to **available**, continue with the next step.
 6. If you created a new instance to replace your original instance, you can terminate the original instance now. It's no longer needed. For the remainder of this procedure, all references to the original instance apply to the new instance that you created.

Step 3: Attach the volume to a temporary instance

Next, launch a temporary instance and attach the volume to it as a secondary volume. This is the instance you use to modify the configuration file.

To launch a temporary instance and attach the volume

1. Launch the temporary instance as follows:
 - a. In the navigation pane, choose **Instances**, choose **Launch instances**, and then select an AMI.

⚠️ Important

To avoid disk signature collisions, you must select an AMI for a different version of Windows. For example, if the original instance runs Windows Server 2019, launch the temporary instance using the base AMI for Windows Server 2016.

- b. Leave the default instance type and choose **Next: Configure Instance Details**.
 - c. On the **Configure Instance Details** page, for **Subnet**, select the same Availability Zone as the original instance and choose **Review and Launch**.
-
- ⚠️ Important**

The temporary instance must be in the same Availability Zone as the original instance. If your temporary instance is in a different Availability Zone, you can't attach the original instance's root volume to it.
- d. On the **Review Instance Launch** page, choose **Launch**.
 - e. When prompted, create a new key pair, download it to a safe location on your computer, and then choose **Launch Instances**.
2. Attach the volume to the temporary instance as a secondary volume as follows:
 - a. In the navigation pane, choose **Volumes**, select the volume that you detached from the original instance, and then choose **Actions, Attach Volume**.
 - b. In the **Attach Volume** dialog box, for **Instances**, start typing the name or ID of your temporary instance and select the instance from the list.
 - c. For **Device**, type **xvdf** (if it isn't already there), and choose **Attach**.

Step 4: Delete the .run-once file

You must now delete the `.run-once` file from the offline volume attached to the instance. This directs EC2Launch v2 to run all tasks with a frequency of once, which includes setting the administrator password. The file path in the secondary volume that you attached will be similar to `D:\ProgramData\Amazon\EC2Launch\state\.run-once`.

To delete the .run-once file

1. Open the **Disk Management** utility, and bring the drive online using these instructions: [Making an Amazon EBS volume available for use](#).
2. Locate the .run-once file in the disk you brought online.
3. Delete the .run-once file.

 **Important**

Any scripts set to run once will be triggered by this action.

Step 5: Restart the original instance

After you have deleted the .run-once file, reattach the volume to the original instance as the root volume and connect to the instance using its key pair to retrieve the administrator password.

1. Reattach the volume to the original instance as follows:
 - a. In the navigation pane, choose **Volumes**, select the volume that you detached from the temporary instance, and then choose **Actions, Attach Volume**.
 - b. In the **Attach Volume** dialog box, for **Instances**, start typing the name or ID of your original instance and then select the instance.
 - c. For **Device**, type **/dev/sda1**.
 - d. Choose **Attach**. After the volume status changes to **in-use**, continue to the next step.
2. In the navigation pane, choose **Instances**. Select the original instance and choose **Instance state, Start instance**. After the instance state changes to **Running**, continue to the next step.
3. Retrieve your new Windows administrator password using the private key for the new key pair and connect to the instance. For more information, see [Connect to your Windows instance](#).

 **Important**

The instance gets a new public IP address after you stop and start it. Make sure to connect to the instance using its current public DNS name. For more information, see [Instance lifecycle](#).

4. (Optional) If you have no further use for the temporary instance, you can terminate it. Select the temporary instance, and choose **Instance State, Terminate instance**.

Reset the Windows administrator password using EC2Config

If you have lost your Windows administrator password and are using a Windows AMI before Windows Server 2016, you can use the EC2Config agent to generate a new password.

If you are using a Windows Server 2016 or later AMI, see [Reset the Windows administrator password using EC2Launch](#) or, you can use the [EC2Rescue tool](#), which uses the EC2Launch service to generate a new password.

 **Note**

If you have disabled the local administrator account on the instance and your instance is configured for Systems Manager, you can also re-enable and reset your local administrator password by using EC2Rescue and Run Command. For more information, see [Using EC2Rescue for Windows Server with Systems Manager Run Command](#).

 **Note**

There is an AWS Systems Manager Automation document that automatically applies the manual steps necessary to reset the local administrator password. For more information, see [Reset passwords and SSH keys on EC2 instances](#) in the *AWS Systems Manager User Guide*.

To reset your Windows administrator password using EC2Config, you need to do the following:

- [Step 1: Verify that the EC2Config service is running](#)
- [Step 2: Detach the root volume from the instance](#)
- [Step 3: Attach the volume to a temporary instance](#)
- [Step 4: Modify the configuration file](#)
- [Step 5: Restart the original instance](#)

Step 1: Verify that the EC2Config service is running

Before you attempt to reset the administrator password, verify that the EC2Config service is installed and running. You use the EC2Config service to reset the administrator password later in this section.

To verify that the EC2Config service is running

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and then select the instance that requires a password reset. This instance is referred to as the *original* instance in this procedure.
3. (New console) Choose **Actions, Monitor and troubleshoot, Get system log**.
(Old console) Choose **Actions, System Settings, Get System Log**.
4. Locate the EC2 Agent entry, for example, **EC2 Agent: Ec2Config service v3.18.1118**. If you see this entry, the EC2Config service is running.

If the system log output is empty, or if the EC2Config service is not running, troubleshoot the instance using the Instance Console Screenshot service. For more information, see [Capture a screenshot of an unreachable instance](#).

Step 2: Detach the root volume from the instance

You can't use EC2Config to reset an administrator password if the volume on which the password is stored is attached to an instance as the root volume. You must detach the volume from the original instance before you can attach it to a temporary instance as a secondary volume.

To detach the root volume from the instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance that requires a password reset and choose **Actions, Instance state, Stop instance**. After the status of the instance changes to **Stopped**, continue with the next step.
4. (Optional) If you have the private key that you specified when you launched this instance, continue with the next step. Otherwise, use the following steps to replace the instance with a new instance that you launch with a new key pair.

- a. Create a new key pair using the Amazon EC2 console. To give your new key pair the same name as the one for which you lost the private key, you must first delete the existing key pair.
 - b. Select the instance to replace. Note the instance type, VPC, subnet, security group, and IAM role of the instance.
 - c. Choose **Actions, Image and templates, Create image**. Type a name and a description for the image and choose **Create image**. In the navigation pane, choose **AMIs**. After the image status changes to **available**, continue to the next step.
 - d. Select the image and choose **Actions**, and then **Launch**.
 - e. Complete the wizard, selecting the same instance type, VPC, subnet, security group, and IAM role as the instance to replace, and then choose **Launch**.
 - f. When prompted, choose the key pair that you created for the new instance, select the acknowledgement check box, and then choose **Launch Instances**.
 - g. (Optional) If the original instance has an associated Elastic IP address, transfer it to the new instance. If the original instance has EBS volumes in addition to the root volume, transfer them to the new instance.
5. Detach the root volume from the original instance as follows:
 - a. In the **Description** pane of the original instance, note the ID of the EBS volume listed as the **Root device**.
 - b. In the navigation pane, choose **Volumes**.
 - c. In the list of volumes, select the volume noted in the previous step, and choose **Actions, Detach Volume**. After the volume status changes to **available**, continue with the next step.
 6. If you created a new instance to replace your original instance, you can terminate the original instance now. It's no longer needed. For the remainder of this procedure, all references to the original instance apply to the new instance that you created.

Step 3: Attach the volume to a temporary instance

Next, launch a temporary instance and attach the volume to it as a secondary volume. This is the instance you use to modify the configuration file.

To launch a temporary instance and attach the volume

1. Launch the temporary instance as follows:
 - a. In the navigation pane, choose **Instances**, choose **Launch instances**, and then select an AMI.

Important

To avoid disk signature collisions, you must select an AMI for a different version of Windows. For example, if the original instance runs Windows Server 2019, launch the temporary instance using the base AMI for Windows Server 2016.
 - b. Leave the default instance type and choose **Next: Configure Instance Details**.
 - c. On the **Configure Instance Details** page, for **Subnet**, select the same Availability Zone as the original instance and choose **Review and Launch**.
 - Important**

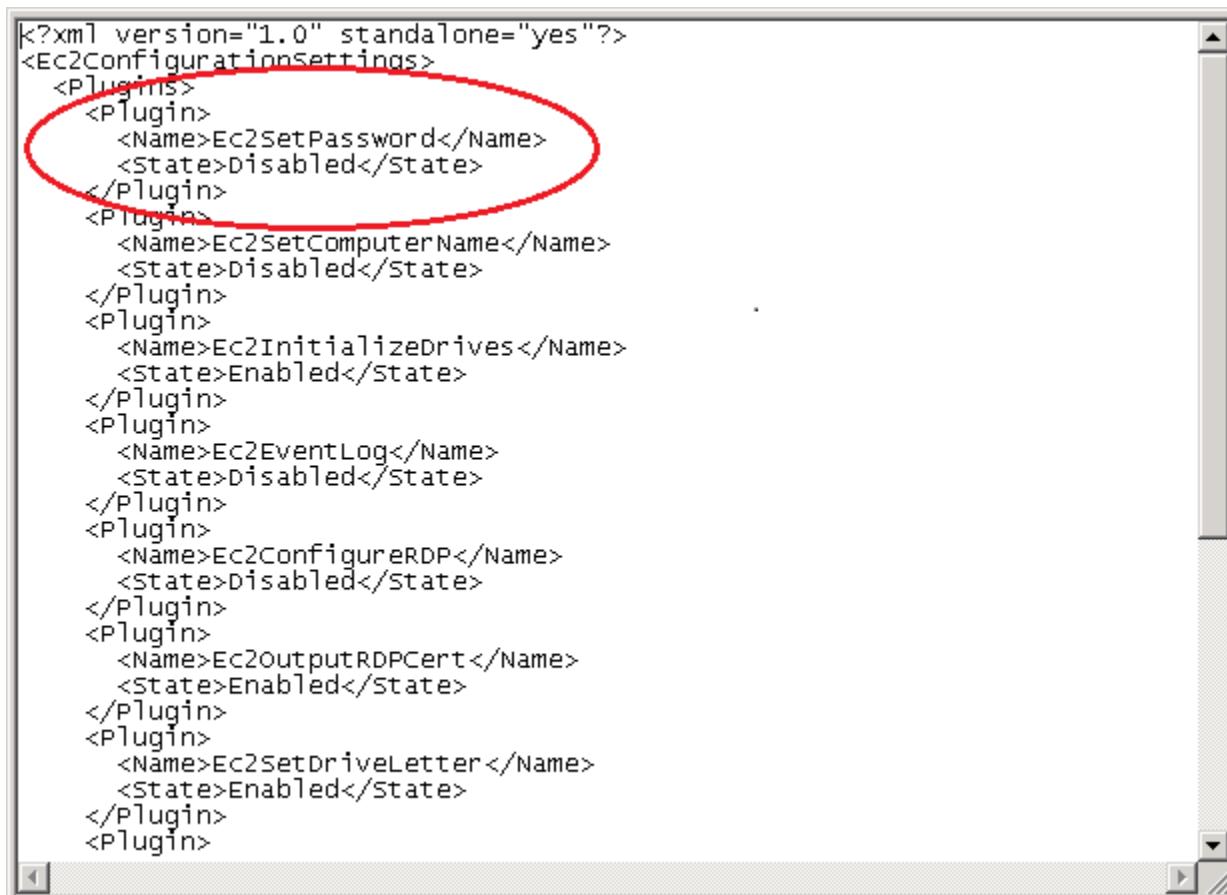

The temporary instance must be in the same Availability Zone as the original instance. If your temporary instance is in a different Availability Zone, you can't attach the original instance's root volume to it.
 - d. On the **Review Instance Launch** page, choose **Launch**.
 - e. When prompted, create a new key pair, download it to a safe location on your computer, and then choose **Launch Instances**.
2. Attach the volume to the temporary instance as a secondary volume as follows:
 - a. In the navigation pane, choose **Volumes**, select the volume that you detached from the original instance, and then choose **Actions, Attach Volume**.
 - b. In the **Attach Volume** dialog box, for **Instances**, start typing the name or ID of your temporary instance and select the instance from the list.
 - c. For **Device**, type **xvdf** (if it isn't already there), and choose **Attach**.

Step 4: Modify the configuration file

After you have attached the volume to the temporary instance as a secondary volume, modify the Ec2SetPassword plugin in the configuration file.

To modify the configuration file

1. From the temporary instance, modify the configuration file on the secondary volume as follows:
 - a. Launch and connect to the temporary instance.
 - b. Open the **Disk Management** utility, and bring the drive online using these instructions: [Making an Amazon EBS volume available for use](#).
 - c. Navigate to the secondary volume, and open \Program Files\Amazon\Ec2ConfigService\Settings\config.xml using a text editor, such as Notepad.
 - d. At the top of the file, find the plugin with the name Ec2SetPassword, as shown in the screenshot. Change the state from Disabled to Enabled and save the file.

```
<?xml version="1.0" standalone="yes"?>
<Ec2ConfigurationSettings>
  <Plugins>
    <Plugin>
      <Name>Ec2SetPassword</Name>
      <State>Disabled</State>
    </Plugin>
    <Plugin>
      <Name>Ec2SetComputerName</Name>
      <State>Disabled</State>
    </Plugin>
    <Plugin>
      <Name>Ec2InitializeDrives</Name>
      <State>Enabled</State>
    </Plugin>
    <Plugin>
      <Name>Ec2EventLog</Name>
      <State>Disabled</State>
    </Plugin>
    <Plugin>
      <Name>Ec2ConfigureRDP</Name>
      <State>Disabled</State>
    </Plugin>
    <Plugin>
      <Name>Ec2OutputRDPCert</Name>
      <State>Enabled</State>
    </Plugin>
    <Plugin>
      <Name>Ec2SetDriveLetter</Name>
      <State>Enabled</State>
    </Plugin>
  </Plugins>
</Ec2ConfigurationSettings>
```

2. After you have modified the configuration file, detach the secondary volume from the temporary instance as follows:
 - a. Using the **Disk Management** utility, bring the volume offline.
 - b. Disconnect from the temporary instance and return to the Amazon EC2 console.
 - c. In the navigation pane, choose **Volumes**, select the volume, and then choose **Actions**, **Detach Volume**. After the volume's status changes to **available**, continue with the next step.

Step 5: Restart the original instance

After you have modified the configuration file, reattach the volume to the original instance as the root volume and connect to the instance using its key pair to retrieve the administrator password.

1. Reattach the volume to the original instance as follows:
 - a. In the navigation pane, choose **Volumes**, select the volume that you detached from the temporary instance, and then choose **Actions**, **Attach Volume**.
 - b. In the **Attach Volume** dialog box, for **Instances**, start typing the name or ID of your original instance and then select the instance.
 - c. For **Device**, type **/dev/sda1**.
 - d. Choose **Attach**. After the volume status changes to **in-use**, continue to the next step.
2. In the navigation pane, choose **Instances**. Select the original instance and choose **Instance state**, **Start instance**. After the instance state changes to **Running**, continue to the next step.
3. Retrieve your new Windows administrator password using the private key for the new key pair and connect to the instance. For more information, see [Connect to your Windows instance](#).

 **Important**

The instance gets a new public IP address after you stop and start it. Make sure to connect to the instance using its current public DNS name. For more information, see [Instance lifecycle](#).

4. (Optional) If you have no further use for the temporary instance, you can terminate it. Select the temporary instance, and choose **Instance State**, **Terminate instance**.

Reset the Windows administrator password using EC2Launch

If you have lost your Windows administrator password and are using a Windows Server 2016 or later AMI, you can use the [EC2Rescue tool](#), which uses the EC2Launch service to generate a new password.

If you are using a Windows Server 2016 or later AMI that does not include the EC2Launch v2 agent, you can use EC2Launch v2 to generate a new password.

If you are using a Windows Server AMI earlier than Windows Server 2016, see [Reset the Windows administrator password using EC2Config](#).

Warning

When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.

Note

If you have disabled the local administrator account on the instance and your instance is configured for Systems Manager, you can also re-enable and reset your local administrator password by using EC2Rescue and Run Command. For more information, see [Using EC2Rescue for Windows Server with Systems Manager Run Command](#).

Note

There is an AWS Systems Manager Automation document that automatically applies the manual steps necessary to reset the local administrator password. For more information, see [Reset passwords and SSH keys on EC2 instances](#) in the *AWS Systems Manager User Guide*.

To reset your Windows administrator password using EC2Launch, you need to do the following:

- [Step 1: Detach the root volume from the instance](#)
- [Step 2: Attach the volume to a temporary instance](#)

- [Step 3: Reset the administrator password](#)
- [Step 4: Restart the original instance](#)

Step 1: Detach the root volume from the instance

You can't use EC2Launch to reset an administrator password if the volume on which the password is stored is attached to an instance as the root volume. You must detach the volume from the original instance before you can attach it to a temporary instance as a secondary volume.

To detach the root volume from the instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance that requires a password reset and choose **Actions, Instance state, Stop instance**. After the status of the instance changes to **Stopped**, continue with the next step.
4. (Optional) If you have the private key that you specified when you launched this instance, continue with the next step. Otherwise, use the following steps to replace the instance with a new instance that you launch with a new key pair.
 - a. Create a new key pair using the Amazon EC2 console. To give your new key pair the same name as the one for which you lost the private key, you must first delete the existing key pair.
 - b. Select the instance to replace. Note the instance type, VPC, subnet, security group, and IAM role of the instance.
 - c. Choose **Actions, Image and templates, Create image**. Type a name and a description for the image and choose **Create image**. In the navigation pane, choose **AMIs**. After the image status changes to **available**, continue to the next step.
 - d. Select the image and choose **Actions**, and then **Launch**.
 - e. Complete the wizard, selecting the same instance type, VPC, subnet, security group, and IAM role as the instance to replace, and then choose **Launch**.
 - f. When prompted, choose the key pair that you created for the new instance, select the acknowledgement check box, and then choose **Launch Instances**.
 - g. (Optional) If the original instance has an associated Elastic IP address, transfer it to the new instance. If the original instance has EBS volumes in addition to the root volume, transfer them to the new instance.

5. Detach the root volume from the original instance as follows:
 - a. In the **Description** pane of the original instance, note the ID of the EBS volume listed as the **Root device**.
 - b. In the navigation pane, choose **Volumes**.
 - c. In the list of volumes, select the volume noted in the previous step, and choose **Actions**, **Detach Volume**. After the volume status changes to **available**, continue with the next step.
6. If you created a new instance to replace your original instance, you can terminate the original instance now. It's no longer needed. For the remainder of this procedure, all references to the original instance apply to the new instance that you created.

Step 2: Attach the volume to a temporary instance

Next, launch a temporary instance and attach the volume to it as a secondary volume. This is the instance you use to run EC2Launch.

To launch a temporary instance and attach the volume

1. Launch the temporary instance as follows:
 - a. In the navigation pane, choose **Instances**, choose **Launch instances**, and then select an AMI.

Important

To avoid disk signature collisions, you must select an AMI for a different version of Windows. For example, if the original instance runs Windows Server 2019, launch the temporary instance using the base AMI for Windows Server 2016.
 - b. Leave the default instance type and choose **Next: Configure Instance Details**.
 - c. On the **Configure Instance Details** page, for **Subnet**, select the same Availability Zone as the original instance and choose **Review and Launch**.

⚠️ Important

The temporary instance must be in the same Availability Zone as the original instance. If your temporary instance is in a different Availability Zone, you can't attach the original instance's root volume to it.

- d. On the **Review Instance Launch** page, choose **Launch**.
 - e. When prompted, create a new key pair, download it to a safe location on your computer, and then choose **Launch Instances**.
2. Attach the volume to the temporary instance as a secondary volume as follows:
- a. In the navigation pane, choose **Volumes**, select the volume that you detached from the original instance, and then choose **Actions, Attach Volume**.
 - b. In the **Attach Volume** dialog box, for **Instances**, start typing the name or ID of your temporary instance and select the instance from the list.
 - c. For **Device**, type **xvdf** (if it isn't already there), and choose **Attach**.

Step 3: Reset the administrator password

Next, connect to the temporary instance and use EC2Launch to reset the administrator password.

To reset the administrator password

1. Connect to the temporary instance and use the EC2Rescue for Windows Server tool on the instance to reset the administrator password as follows:
 - a. Download the [EC2Rescue for Windows Server](#) zip file, extract the contents, and run **EC2Rescue.exe**.
 - b. On the **License Agreement** screen, read the license agreement, and, if you accept the terms, choose **I Agree**.
 - c. On the **Welcome to EC2Rescue for Windows Server** screen, choose **Next**.
 - d. On the **Select mode** screen, choose **Offline instance**.
 - e. On the **Select a disk** screen, select the **xvdf** device and choose **Next**.
 - f. Confirm the disk selection and choose **Yes**.
 - g. After the volume has loaded, choose **OK**.

- h. On the **Select Offline Instance Option** screen, choose **Diagnose and Rescue**.
 - i. On the **Summary** screen, review the information and choose **Next**.
 - j. On the **Detected possible issues** screen, select **Reset Administrator Password** and choose **Next**.
 - k. On the **Confirm** screen, choose **Rescue, OK**.
 - l. On the **Done** screen, choose **Finish**.
 - m. Close the EC2Rescue for Windows Server tool, disconnect from the temporary instance, and then return to the Amazon EC2 console.
2. Detach the secondary (xvdf) volume from the temporary instance as follows:
 - a. In the navigation pane, choose **Instances** and select the temporary instance.
 - b. On the **Storage** tab for the temporary instance, note the ID of the EBS volume listed as **xvdf**.
 - c. In the navigation pane, choose **Volumes**.
 - d. In the list of volumes, select the volume noted in the previous step, and choose **Actions**, **Detach Volume**. After the volume status changes to **available**, continue with the next step.

Step 4: Restart the original instance

After you have reset the administrator password using EC2Launch, reattach the volume to the original instance as the root volume and connect to the instance using its key pair to retrieve the administrator password.

To restart the original instance

1. Reattach the volume to the original instance as follows:
 - a. In the navigation pane, choose **Volumes**, select the volume that you detached from the temporary instance, and then choose **Actions**, **Attach Volume**.
 - b. In the **Attach Volume** dialog box, for **Instances**, start typing the name or ID of your original instance and then select the instance.
 - c. For **Device**, type **/dev/sda1**.
 - d. Choose **Attach**. After the volume status changes to **in-use**, continue to the next step.

2. In the navigation pane, choose **Instances**. Select the original instance and choose **Instance state, Start instance**. After the instance state changes to Running, continue to the next step.
3. Retrieve your new Windows administrator password using the private key for the new key pair and connect to the instance. For more information, see [Connect to your Windows instance](#).
4. (Optional) If you have no further use for the temporary instance, you can terminate it. Select the temporary instance, and choose **Instance State, Terminate instance**.

Troubleshoot stopping your instance

If you have stopped your Amazon EBS-backed instance and it appears stuck in the stopping state, there may be an issue with the underlying host computer.

There is no cost for instance usage while an instance is in the stopping state or in any other state except running. You are only charged for instance usage when an instance is in the running state.

Force stop the instance

Force the instance to stop using either the console or the AWS CLI.

Note

You can force an instance to stop using the console only while the instance is in the stopping state. You can force an instance to stop using the AWS CLI while the instance is in any state, except shutting-down and terminated.

Console

To force stop the instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select the stuck instance.
3. Choose **Instance state, Force stop instance, Stop**.

Note that **Force stop instance** is only available in the console if your instance is in the stopping state. If your instance is in another state (except shutting-down and terminated) you can use the AWS CLI to force stop your instance.

AWS CLI

To force stop the instance using the AWS CLI

Use the [stop-instances](#) command and the --force option as follows:

```
aws ec2 stop-instances --instance-ids i-0123ab456c789d01e --force
```

If, after 10 minutes, the instance has not stopped, post a request for help on [AWS re:Post](#). To help expedite a resolution, include the instance ID, and describe the steps that you've already taken. Alternatively, if you have a support plan, create a technical support case in the [Support Center](#).

Create a replacement instance

To attempt to resolve the problem while you are waiting for assistance from [AWS re:Post](#) or the [Support Center](#), create a replacement instance. Create an AMI of the stuck instance, and launch a new instance using the new AMI.

Important

Creating a replacement instance is recommended if it's registering [system status checks](#) only, as instance status checks will result in the AMI copying over an exact replica of the broken OS. Once you've confirmed the status message, create the AMI and launch a new instance using the new AMI.

Console

To create a replacement instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select the stuck instance.
3. Choose **Actions, Image and templates, Create image**.
4. On the **Create image** page, do the following:
 - a. Enter a name and description for the AMI.
 - b. Choose **No reboot**.
 - c. Choose **Create image**.

For more information, see [Create a Windows AMI from a running instance](#).

5. Launch a new instance from the AMI and verify that the new instance is working.
6. Select the stuck instance, and choose **Actions**, **Instance state**, **Terminate instance**. If the instance also gets stuck terminating, Amazon EC2 automatically forces it to terminate within a few hours.

AWS CLI

To create a replacement instance using the CLI

1. Create an AMI from the stuck instance using the [create-image](#) (AWS CLI) command and the `--no-reboot` option as follows:

```
aws ec2 create-image --instance-id i-0123ab456c789d01e --name "AMI" --  
description "AMI for replacement instance" --no-reboot
```

2. Launch a new instance from the AMI using the [run-instances](#) (AWS CLI) command as follows:

```
aws ec2 run-instances --image-id ami-1a2b3c4d --count 1 --instance-type c3.large  
--key-name MyKeyPair --security-groups MySecurityGroup
```

3. Verify that the new instance is working.
4. Terminate the stuck instance using the [terminate-instances](#) (AWS CLI) command as follows:

```
aws ec2 terminate-instances --instance-ids i-1234567890abcdef0
```

If you are unable to create an AMI from the instance as described in the previous procedure, you can set up a replacement instance as follows:

(Alternate) To create a replacement instance using the console

1. Select the instance and choose **Description**, **Block devices**. Select each volume and make note of its volume ID. Be sure to note which volume is the root volume.
2. In the navigation pane, choose **Volumes**. Select each volume for the instance, and choose **Actions**, **Create Snapshot**.

3. In the navigation pane, choose **Snapshots**. Select the snapshot that you just created, and choose **Actions, Create Volume**.
4. Launch an instance with the same operating system as the stuck instance. Note the volume ID and device name of its root volume.
5. In the navigation pane, choose **Instances**, select the instance that you just launched, and choose **Instance state, Stop instance**.
6. In the navigation pane, choose **Volumes**, select the root volume of the stopped instance, and choose **Actions, Detach Volume**.
7. Select the root volume that you created from the stuck instance, choose **Actions, Attach Volume**, and attach it to the new instance as its root volume (using the device name that you made note of). Attach any additional non-root volumes to the instance.
8. In the navigation pane, choose **Instances** and select the replacement instance. Choose **Instance state, Start instance**. Verify that the instance is working.
9. Select the stuck instance, choose **Instance state, Terminate instance**. If the instance also gets stuck terminating, Amazon EC2 automatically forces it to terminate within a few hours.

Troubleshoot instance termination (shutting down)

You are not billed for any instance usage while an instance is not in the running state. In other words, when you terminate an instance, you stop incurring charges for that instance as soon as its state changes to shutting-down.

Instance terminates immediately

Several issues can cause your instance to terminate immediately on start-up. See [Instance terminates immediately](#) for more information.

Delayed instance termination

If your instance remains in the shutting-down state longer than a few minutes, it might be delayed due to shutdown scripts being run by the instance.

Another possible cause is a problem with the underlying host computer. If your instance remains in the shutting-down state for several hours, Amazon EC2 treats it as a stuck instance and forcibly terminates it.

If it appears that your instance is stuck terminating and it has been longer than several hours, post a request for help to [AWS re:Post](#). To help expedite a resolution, include the instance ID and describe the steps that you've already taken. Alternatively, if you have a support plan, create a technical support case in the [Support Center](#).

Terminated instance still displayed

After you terminate an instance, it remains visible for a short while before being deleted. The state shows as terminated. If the entry is not deleted after several hours, contact Support.

Error: The instance may not be terminated. Modify its 'disableApiTermination' instance attribute

If you try to terminate an instance and get the The instance *instance_id* may not be terminated. Modify its 'disableApiTermination' instance attribute error message, it indicates that the instance has been enabled for termination protection. Termination protection prevents the instance from being accidentally terminated. For more information, see [Enable termination protection](#).

You must disable termination protection before you can terminate the instance.

To disable termination protection using the Amazon EC2 console, select the instance and then choose **Actions, Instance Settings, Change Termination Protection**.

To disable termination protection using the AWS CLI, use the following command.

```
C:\> aws ec2 modify-instance-attribute --instance-id instance_id --no-disable-api-termination
```

Instances automatically launched or terminated

Generally, the following behaviors mean that you've used Amazon EC2 Auto Scaling, EC2 Fleet, or Spot Fleet to scale your computing resources automatically based on criteria that you've defined:

- You terminate an instance and a new instance launches automatically.
- You launch an instance and one of your instances terminates automatically.
- You stop an instance and it terminates and a new instance launches automatically.

To stop automatic scaling, see the [Amazon EC2 Auto Scaling User Guide](#), [EC2 Fleet](#), or [Create a Spot Fleet request](#).

Troubleshoot Sysprep

If you experience problems or receive error messages during image preparations, review the following logs. Log location varies depending on whether you are running EC2Config, EC2Launch v1, or EC2Launch v2 with Sysprep.

- %WINDIR%\Panther\Unattendgc (EC2Config, EC2Launch v1, and EC2Launch v2)
- %WINDIR%\System32\Sysprep\Panther (EC2Config, EC2Launch v1, and EC2Launch v2)
- C:\Program Files\Amazon\Ec2ConfigService\Logs\Ec2ConfigLog.txt (EC2Config only)
- C:\ProgramData\Amazon\Ec2Config\Logs (EC2Config only)
- C:\ProgramData\Amazon\EC2-Windows\Launch\Log\EC2Launch.log (EC2Launch v1 only)
- %ProgramData%\Amazon\EC2Launch\log\agent.log (EC2Launch v2 only)

If you receive an error message during image preparation with Sysprep, the OS might not be reachable. To review the log files, you must stop the instance, attach its root volume to another healthy instance as a secondary volume, and then review the logs mentioned earlier on the secondary volume. For more information about the purpose of the log files by name, see [Windows Setup-Related Log Files](#) in the Microsoft documentation.

If you locate errors in the Unattendgc log file, use the [Microsoft Error Lookup Tool](#) to get more details about the error. The following issue reported in the Unattendgc log file is typically the result of one or more corrupted user profiles on the instance:

```
Error [Shell Unattend] _FindLatestProfile failed (0x80070003) [gle=0x00000003]
Error [Shell Unattend] CopyProfile failed (0x80070003) [gle=0x00000003]
```

There are two options for resolving this issue:

Option 1

Use Regedit on the instance to search for the following key. Verify that there are no profile registry keys for a deleted user.

[HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\CurrentVersion
\ProfileList\

Option 2

1. Edit the relevant file, as follows:
 - Windows Server 2012 R2 and earlier – Edit the EC2Config answer file (C:\Program Files\Amazon\Ec2ConfigService\sysprep2008.xml).
 - Windows Server 2016 and 2019 – Edit the unattend.xml answer file (C:\ProgramData\Amazon\EC2-Windows\Launch\Sysprep\Unattend.xml).
 - Windows Server 2022 – Edit the unattend.xml answer file (C:\ProgramData\Amazon\EC2Launch\sysprep\unattend.xml).
2. Change <CopyProfile>true</CopyProfile> to <CopyProfile>false</CopyProfile>.
3. Run Sysprep again. Note that this configuration change will delete the built-in administrator user profile after Sysprep completes.

Use EC2Rescue for Windows Server

EC2Rescue for Windows Server is an easy-to-use tool that you run on an Amazon EC2 Windows Server instance to diagnose and troubleshoot possible problems. It is valuable for collecting log files and troubleshooting issues and also proactively searching for possible areas of concern. It can even examine Amazon EBS root volumes from other instances and collect relevant logs for troubleshooting Windows Server instances using that volume.

EC2Rescue for Windows Server has two different modules: a data collector module that collects data from all different sources, and an analyzer module that parses the data collected against a series of predefined rules to identify issues and provide suggestions.

The EC2Rescue for Windows Server tool only runs on Amazon EC2 instances running Windows Server 2008 R2 and later. When the tool starts, it checks whether it is running on an Amazon EC2 instance.

The AWSSupport-ExecuteEC2Rescue runbook uses the EC2Rescue tool to troubleshoot and, where possible, fix common connectivity issues with the specified EC2 instance. For more information, and to run this automation, see [AWSSupport-ExecuteEC2Rescue](#).

Note

If you are using a Linux instance, see [EC2Rescue for Linux](#).

Contents

- [Use EC2Rescue for Windows Server with Systems Manager Run Command](#)

Use EC2Rescue for Windows Server GUI

EC2Rescue for Windows Server can perform the following analysis on **offline instances**:

Option	Description
Diagnose and Rescue	<p>EC2Rescue for Windows Server can detect and address issues with the following service settings:</p> <ul style="list-style-type: none">• System Time<ul style="list-style-type: none">• RealTimeisUniversal - Detects whether the RealTimeisUniversal registry key is enabled. If disabled, Windows system time drifts when the timezone is set to a value other than UTC.• Windows Firewall<ul style="list-style-type: none">• Domain networks - Detects whether this Windows Firewall profile is enabled or disabled.• Private networks - Detects whether this Windows Firewall profile is enabled or disabled.

Option	Description
	<ul style="list-style-type: none">• Guest or public networks - Detects whether this Windows Firewall profile is enabled or disabled.• Remote Desktop• Service Start - Detects whether the Remote Desktop service is enabled.• Remote Desktop Connections - Detects whether this is enabled.• TCP Port - Detects which port the Remote Desktop service is listening on.• EC2Config (Windows Server 2012 R2 and earlier)• Installation - Detects which EC2Config version is installed.• Service Start - Detects whether the EC2Config service is enabled.• Ec2SetPassword - Generates a new administrator password.• Ec2HandleUserData - Allows you to run a user data script on the next boot of the instance.• EC2Launch (Windows Server 2016 and later)<ul style="list-style-type: none">• Installation - Detects which EC2Launch version is installed.• Ec2SetPassword - Generates a new administrator password.• Network Interface

Option	Description
	<ul style="list-style-type: none"> • DHCP Service Startup - Detects whether the DHCP service is enabled. • Ethernet detail - Displays information about the network driver version, if detected. • DHCP on Ethernet - Detects whether DHCP is enabled. • Disk signature status <ul style="list-style-type: none"> • Signature on disk and Signature on Boot Configuration Database (BCD) - Detects whether the disk signature and the BCD signature are the same. If the values are different, EC2Rescue attempts to overwrite the disk signature with the signature on BCD.
Restore	<p>Perform one of the following actions:</p> <ul style="list-style-type: none"> • Last Known Good Configuration - Attempts to boot the instance into the last known bootable state. • Restore registry from backup - Restores the registry from <code>\Windows\System32\config\RegBack</code> .
Capture Logs	Allows you to capture logs on the instance for analysis.

EC2Rescue for Windows Server can collect the following data from **active and offline instances**:

Item	Description
Event Log	Collects application, system, and EC2Config event logs.

Item	Description
Registry	Collects SYSTEM and SOFTWARE hives.
Windows Update Log	Collects log files generated by Windows Update.
	<p> Note</p> <p>In Windows Server 2016 and later, the log is collected in Event Tracing for Windows (ETW) format.</p>
Sysprep Log	Collects log files generated by the Windows System Preparation tool.
Driver Setup Log	Collects Windows SetupAPI logs (setupapi.dev.log and setupapi.setup.log).
Boot Configuration	Collects HKEY_LOCAL_MACHINE \BCD00000000 hive.
Memory Dump	Collects any memory dump files that exist on the instance.
EC2Config File	Collects log files generated by the EC2Config service.
EC2Launch File	Collects log files generated by the EC2Launch scripts.
SSM Agent File	Collects log files generated by SSM Agent and Patch Manager logs.
EC2 ElasticGPUs File	Collects event logs related to elastic GPUs.
ECS	Collects logs related to Amazon ECS.

Item	Description
CloudEndure	Collects log files related to CloudEndure Agent.

EC2Rescue for Windows Server can collect the following additional data from **active instances**:

Item	Description
System Information	Collects MSInfo32.
Group Policy Result	Collects a Group Policy report.

Analyze an offline instance

The **Offline Instance** option is useful for debugging boot issues with Windows instances.

To perform an action on an offline instance

- From a working Windows Server instance, download the [EC2Rescue for Windows Server](#) tool and extract the files.

You can run the following PowerShell command to download EC2Rescue without changing your Internet Explorer Enhanced Security Configuration (ESC):

```
Invoke-WebRequest https://s3.amazonaws.com/ec2rescue/windows/EC2Rescue_latest.zip -  
OutFile $env:USERPROFILE\Desktop\EC2Rescue_latest.zip
```

This command will download the EC2Rescue .zip file to the desktop of the currently logged in user.

- Stop the faulty instance, if it is not stopped already.
- Detach the EBS root volume from the faulty instance and attach the volume to a working Windows instance that has EC2Rescue for Windows Server installed.
- Run the EC2Rescue for Windows Server tool on the working instance and choose **Offline Instance**.

5. Select the disk of the newly mounted volume and choose **Next**.
6. Confirm the disk selection and choose **Yes**.
7. Choose the offline instance option to perform and choose **Next**.

The EC2Rescue for Windows Server tool scans the volume and collects troubleshooting information based on the selected log files.

Collect data from an active instance

You can collect logs and other data from an active instance.

To collect data from an active instance

1. Connect to your Windows instance.
2. Download the [EC2Rescue for Windows Server](#) tool to your Windows instance and extract the files.

You can run the following PowerShell command to download EC2Rescue without changing your Internet Explorer Enhanced Security Configuration (ESC):

```
Invoke-WebRequest https://s3.amazonaws.com/ec2rescue/windows/EC2Rescue_latest.zip -  
OutFile $env:USERPROFILE\Desktop\EC2Rescue_latest.zip
```

This command will download the EC2Rescue .zip file to the desktop of the currently logged in user.

3. Open the EC2Rescue for Windows Server application and accept the license agreement.
4. Choose **Next, Current instance, Capture logs**.
5. Select the data items to collect and choose **Collect....** Read the warning and choose **Yes** to continue.
6. Choose a file name and location for the ZIP file and choose **Save**.
7. After EC2Rescue for Windows Server completes, choose **Open Containing Folder** to view the ZIP file.
8. Choose **Finish**.

Use EC2Rescue for Windows Server with the command line

The EC2Rescue for Windows Server command line interface (CLI) allows you to run an EC2Rescue for Windows Server plugin (referred as an "action") programmatically.

The EC2Rescue for Windows Server tool has two execution modes:

- **/online**—This allows you to take action on the instance that EC2Rescue for Windows Server is installed on, such as collect log files.
- **/offline:<device_id>**—This allows you to take action on the offline root volume that is attached to a separate Amazon EC2 Windows instance, on which you have installed EC2Rescue for Windows Server.

Download the [EC2Rescue for Windows Server](#) tool to your Windows instance and extract the files. You can view the help file using the following command:

```
EC2RescueCmd.exe /help
```

EC2Rescue for Windows Server can perform the following actions on an Amazon EC2 Windows instance:

- [Collect action](#)
- [Rescue action](#)
- [Restore action](#)

Collect action

 **Note**

You can collect all logs, an entire log group, or an individual log within a group.

EC2Rescue for Windows Server can collect the following data from **active and offline instances**.

Log group	Available logs	Description
all		Collects all available logs.

Log group	Available logs	Description
eventlog	<ul style="list-style-type: none"> 'Application' 'System' 'EC2ConfigService' 	Collects application, system, and EC2Config event logs.
memory-dump	<ul style="list-style-type: none"> 'Memory Dump File' 'Mini Dump Files' 	Collects any memory dump files that exist on the instance.
ec2config	<ul style="list-style-type: none"> 'Log Files' 'Configuration Files' 	Collects log files generated by the EC2Config service.
ec2launch	<ul style="list-style-type: none"> 'Logs' 'Config' 	Collects log files generated by the EC2Launch scripts.
ssm-agent	<ul style="list-style-type: none"> 'Log Files' 'Patch Baseline Logs' 'InstanceData' 	Collects log files generated by SSM Agent and Patch Manager logs.
sysprep	'Log Files'	Collects log files generated by the Windows System Preparation tool.
driver-setup	<ul style="list-style-type: none"> 'SetupAPI Log Files' 'DPIInst Log File' 'AWS PV Setup Log File' 	Collects Windows SetupAPI logs (<code>setupapi.dev.log</code> and <code>setupapi.setup.log</code>).
registry	<ul style="list-style-type: none"> 'SYSTEM' 'SOFTWARE' 'BCD' 	Collects SYSTEM and SOFTWARE hives.
egpu	<ul style="list-style-type: none"> 'Event Log' 'System Files' 	Collects event logs related to elastic GPUs.

Log group	Available logs	Description
boot-config	'BCDEDIT Output'	Collects HKEY_LOCA L_MACHINE\BCD00000 000 hive.
windows-update	'Log Files'	Collects log files generated by Windows Update.
cloudendure	<ul style="list-style-type: none"> • 'Migrate Script Logs' • 'Driver Logs' • 'CloudEndure File List' 	<p>Note</p> <p>In Windows Server 2016 and later, the log is collected in Event Tracing for Windows (ETW) format.</p>

EC2Rescue for Windows Server can collect the following additional data from **active instances**.

Log group	Available logs	Description
system-info	'MSInfo32 Output'	Collects MSInfo32.
gpresult	'GPResult Output'	Collects a Group Policy report.

The following are the available options:

- **/output:<outputFilePath>** - Required destination file path location to save collected log files in zip format.

- **/no-offline** - Optional attribute used in offline mode. Does not set the volume offline after completing the action.
- **/no-fix-signature** - Optional attribute used in offline mode. Does not fix a possible disk signature collision after completing the action.

Examples

The following are examples using the EC2Rescue for Windows Server CLI.

Online mode examples

Collect all available logs:

```
EC2RescueCmd /accepteula /online /collect:all /output:<outputFilePath>
```

Collect only a specific log group:

```
EC2RescueCmd /accepteula /online /collect:ec2config /output:<outputFilePath>
```

Collect individual logs within a log group:

```
EC2RescueCmd /accepteula /online /collect:'ec2config.Log Files,driver-setup.SetupAPI Log Files' /output:<outputFilePath>
```

Offline mode examples

Collect all available logs from an EBS volume. The volume is specified by the device_id value.

```
EC2RescueCmd /accepteula /offline:xvdf /collect:all /output:<outputFilePath>
```

Collect only a specific log group:

```
EC2RescueCmd /accepteula /offline:xvdf /collect:ec2config /output:<outputFilePath>
```

Rescue action

EC2Rescue for Windows Server can detect and address issues with the following service settings:

Service group	Available actions	Description
all		
system-time	'RealTimeIsUniversal'	<p>System Time</p> <ul style="list-style-type: none"> RealTimeIsUniversal <ul style="list-style-type: none"> - Detects whether the RealTimeIsUniversal registry key is enabled. If disabled, Windows system time drifts when the timezone is set to a value other than UTC.
firewall	<ul style="list-style-type: none"> 'Domain networks' 'Private networks' 'Guest or public networks' 	<p>Windows Firewall</p> <ul style="list-style-type: none"> Domain networks - Detects whether this Windows Firewall profile is enabled or disabled. Private networks - Detects whether this Windows Firewall profile is enabled or disabled. Guest or public networks <ul style="list-style-type: none"> - Detects whether this Windows Firewall profile is enabled or disabled.
rdp	<ul style="list-style-type: none"> 'Service Start' 'Remote Desktop Connections' 'TCP Port' 	<p>Remote Desktop</p> <ul style="list-style-type: none"> Service Start - Detects whether the Remote Desktop service is enabled.

Service group	Available actions	Description
		<ul style="list-style-type: none"> • Remote Desktop Connections - Detects whether this is enabled. • TCP Port - Detects which port the Remote Desktop service is listening on.
ec2config	<ul style="list-style-type: none"> • 'Service Start' • 'Ec2SetPassword' • 'Ec2HandleUserData' 	<p>EC2Config</p> <ul style="list-style-type: none"> • Service Start - Detects whether the EC2Config service is enabled. • Ec2SetPassword - Generates a new administrator password. • Ec2HandleUserData - Allows you to run a user data script on the next boot of the instance.
ec2launch	'Reset Administrator Password'	Generates a new Windows administrator password.
network	'DHCP Service Startup'	<p>Network Interface</p> <ul style="list-style-type: none"> • DHCP Service Startup - Detects whether the DHCP service is enabled.

The following are the available options:

- **/level:<level>** - Optional attribute for the check level that the action should trigger. Allowed values are: information, warning, error, all. By default, it is set to error.
- **/check-only** - Optional attribute that generates a report but makes no modifications to the offline volume.

- **/no-offline** - Optional attribute that prevents the volume from being set offline after completing the action.
- **/no-fix-signature** - Optional attribute that does not fix a possible disk signature collision after completing the action.

Rescue examples

The following are examples using the EC2Rescue for Windows Server CLI. The volume is specified using the device_id value.

Attempt to fix all identified issues on a volume:

```
EC2RescueCmd /accepteula /offline:xvdf /rescue:all
```

Attempt to fix all issues within a service group on a volume:

```
EC2RescueCmd /accepteula /offline:xvdf /rescue:firewall
```

Attempt to fix a specific item within a service group on a volume:

```
EC2RescueCmd /accepteula /offline:xvdf /rescue:rdp.'Service Start'
```

Specify multiple issues to attempt to fix on a volume:

```
EC2RescueCmd /accepteula /offline:xvdf /rescue:'system-time.RealTimeIsUniversal,ec2config.Service Start'
```

Restore action

EC2Rescue for Windows Server can detect and address issues with the following service settings:

Service Group	Available Actions	Description
Restore Last Known Good Configuration	lkgc	Last Known Good Configuration - Attempts to boot the instance into the last known bootable state.

Service Group	Available Actions	Description
Restore Windows registry from latest backup	regback	Restore registry from backup - Restores the registry from \Windows\System32\config\RegBack .

The following are the available options:

- **/no-offline**—Optional attribute that prevents the volume from being set offline after completing the action.
- **/no-fix-signature**—Optional attribute that does not fix a possible disk signature collision after completing the action.

Restore examples

The following are examples using the EC2Rescue for Windows Server CLI. The volume is specified using the device_id value.

Restore last known good configuration on a volume:

```
EC2RescueCmd /accepteula /offline:xvdf /restore:lkgc
```

Restore the last Windows registry backup on a volume:

```
EC2RescueCmd /accepteula /offline:xvdf /restore:regback
```

Use EC2Rescue for Windows Server with Systems Manager Run Command

AWS Support provides you with a Systems Manager Run Command document to interface with your Systems Manager-enabled instance to run EC2Rescue for Windows Server. The Run Command document is called AwSSupport-RunEC2RescueForWindowsTool.

This Systems Manager Run Command document performs the following tasks:

- Downloads and verifies EC2Rescue for Windows Server.
- Imports a PowerShell module to ease your interaction with the tool.
- Runs EC2RescueCmd with the provided command and parameters.

The Systems Manager Run Command document accepts three parameters:

- **Command**—The EC2Rescue for Windows Server action. The current allowed values are:
 - **ResetAccess**—Resets the local Administrator password. The local Administrator password of the current instance will be reset and the randomly generated password will be securely stored in Parameter Store as /EC2Rescue/Password/<INSTANCE_ID>. If you select this action and provide no parameters, passwords are encrypted automatically with the default KMS key. Optionally, you can specify a KMS key ID in Parameters to encrypt the password with your own key.
 - **CollectLogs**—Runs EC2Rescue for Windows Server with the /collect:all action. If you select this action, Parameters must include an Amazon S3 bucket name to upload the logs to.
 - **FixAll**—Runs EC2Rescue for Windows Server with the /rescue:all action. If you select this action, Parameters must include the block device name to rescue.
- **Parameters**—The PowerShell parameters to pass for the specified command.

Note

In order for the **ResetAccess** action to work, your Amazon EC2 instance needs to have the following policy attached in order to write the encrypted password to Parameter Store. Please wait a few minutes before attempting to reset the password of an instance after you have attached this policy to the related IAM role.

Using the default KMS key:

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ssm:PutParameter"  
            ],  
            "Resource": "arn:aws:ssm:  
                <region>:  
                <account>/parameter/  
                EC2Rescue/Password/<instance_id>"  
        }  
    ]  
}
```

```
        "Resource": [
            "arn:aws:ssm:region:account_id:parameter/EC2Rescue/
            Passwords/<instanceid>"  

        ]
    }
]
```

Using a custom KMS key:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:PutParameter"
            ],
            "Resource": [
                "arn:aws:ssm:region:account_id:parameter/EC2Rescue/
                Passwords/<instanceid>"  

            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "kms:Encrypt"
            ],
            "Resource": [
                "arn:aws:kms:region:account_id:key/<kmskeyid>"  

            ]
        }
    ]
}
```

The following procedure describes how to view the JSON for this document in the Amazon EC2 console.

To view the JSON for the Systems Manager Run Command document

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager/home>.
2. In the navigation pane, expand **Shared Services** and choose **Documents**.
3. In the search bar, set **Owner** as **Owned by Me or Amazon** and set the **Document name prefix** to AWSSupport-RunEC2RescueForWindowsTool.
4. Select the AWSSupport-RunEC2RescueForWindowsTool document, choose **Contents**, and then view the JSON.

Examples

Here are some examples on how to use the Systems Manager Run Command document to run EC2Rescue for Windows Server, using the AWS CLI. For more information about sending commands with the AWS CLI, see the [AWS CLI Command Reference](#).

Attempt to fix all identified issues on an offline root volume

Attempt to fix all identified issues on an offline root volume attached to an Amazon EC2 Windows instance:

```
aws ssm send-command --instance-ids "i-0cb2b964d3e14fd9f" --document-name "AWSSupport-RunEC2RescueForWindowsTool" --comment "EC2Rescue offline volume xvdf" --parameters "Command=FixAll, Parameters='xvdf'" --output text
```

Collect logs from the current Amazon EC2 Windows instance

Collect all logs from the current online Amazon EC2 Windows instance and upload them to an Amazon S3 bucket:

```
aws ssm send-command --instance-ids "i-0cb2b964d3e14fd9f" --document-name "AWSSupport-RunEC2RescueForWindowsTool" --comment "EC2Rescue online log collection to S3" --parameters "Command=CollectLogs, Parameters='YOURS3BUCKETNAME'" --output text
```

Collect logs from an offline Amazon EC2 Windows instance volume

Collect all logs from an offline volume attached to an Amazon EC2 Windows instance and upload them to Amazon S3 with a presigned URL:

```
aws ssm send-command --instance-ids "i-0cb2b964d3e14fd9f" --document-name "AWSSupport-RunEC2RescueForWindowsTool" --comment "EC2Rescue offline log collection to S3" --parameters "Command=CollectLogs, Parameters=\"-Offline -BlockDeviceName xvdf -S3PreSignedUrl 'YOURS3PRESIGNEDURL'\"'" --output text
```

Reset the local Administrator password

The following examples show methods you can use to reset the local Administrator password. The output provides a link to Parameter Store, where you can find the randomly generated secure password you can then use to RDP to your Amazon EC2 Windows instance as the local Administrator.

Reset the local Administrator password of an online instance using the default AWS KMS key alias/ aws/ssm:

```
aws ssm send-command --instance-ids "i-0cb2b964d3e14fd9f" --document-name "AWSSupport-RunEC2RescueForWindowsTool" --comment "EC2Rescue online password reset" --parameters "Command=ResetAccess" --output text
```

Reset the local Administrator password of an online instance using a KMS key:

```
aws ssm send-command --instance-ids "i-0cb2b964d3e14fd9f" --document-name "AWSSupport-RunEC2RescueForWindowsTool" --comment "EC2Rescue online password reset" --parameters "Command=ResetAccess, Parameters=a133dc3c-a2g4-4fc6-a873-6c0720104bf0" --output text
```

Note

In this example, the KMS key is a133dc3c-a2g4-4fc6-a873-6c0720104bf0.

EC2 Serial Console for Windows instances

With the EC2 serial console, you have access to your Amazon EC2 instance's serial port, which you can use to troubleshoot boot, network configuration, and other issues. The serial console does not require your instance to have any networking capabilities. With the serial console, you can enter commands to an instance as if your keyboard and monitor are directly attached to the instance's serial port. The serial console session lasts during instance reboot and stop. During reboot, you can view all of the boot messages from the start.

Access to the serial console is not available by default. Your organization must grant account access to the serial console and configure IAM policies to grant your users access to the serial console. Serial console access can be controlled at a granular level by using instance IDs, resource tags, and other IAM levers. For more information, see [Configure access to the EC2 Serial Console](#).

The serial console can be accessed by using the EC2 console or the AWS CLI.

The serial console is available at no additional cost.

If you are using a Linux instance, see [EC2 Serial Console for Linux instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

Topics

- [Prerequisites](#)
- [Configure access to the EC2 Serial Console](#)
- [Connect to the EC2 Serial Console](#)
- [Disconnect from the EC2 Serial Console](#)
- [Troubleshoot your Windows instance using the EC2 Serial Console](#)

Prerequisites

To connect to the EC2 Serial Console and use your chosen tool for troubleshooting, the following prerequisites must be in place:

- [AWS Regions](#)
- [Wavelength Zones and AWS Outposts](#)
- [Local Zones](#)
- [Instance types](#)
- [Grant access](#)
- [Support for browser-based client](#)
- [Instance state](#)
- [Amazon EC2 Systems Manager](#)
- [sshd server](#)
- [Configure your chosen troubleshooting tool](#)

AWS Regions

Supported in all AWS Regions except Canada West (Calgary).

Wavelength Zones and AWS Outposts

Not supported.

Local Zones

Supported in all Local Zones.

Instance types

Supported for all virtualized instances built on the Nitro System.

Not supported on bare metal instances.

Grant access

You must complete the configuration tasks to grant access to the EC2 Serial Console. For more information, see [Configure access to the EC2 Serial Console](#).

Support for browser-based client

To connect to the serial console [using the browser-based client](#), your browser must support WebSocket. If your browser does not support WebSocket, connect to the serial console [using your own key and an SSH client](#).

Instance state

Must be running.

You can't connect to the serial console if the instance is in the pending, stopping, stopped, shutting-down, or terminated state.

For more information about the instance states, see [Instance lifecycle](#).

Amazon EC2 Systems Manager

If the instance uses Amazon EC2 Systems Manager, then SSM Agent version 3.0.854.0 or later must be installed on the instance. For information about SSM Agent, see [Working with SSM Agent](#) in the [AWS Systems Manager User Guide](#).

sshd server

You do not need an sshd server installed or running on your instance.

Configure your chosen troubleshooting tool

To troubleshoot your Windows instance via the serial console, you can use the Special Admin Console (SAC). Before you can use SAC, you must first enable SAC and the boot menu on every instance on which you'll use it.

For the instructions to configure your chosen troubleshooting tool on Linux, see [Configure your chosen troubleshooting tool](#) in the *Amazon EC2 User Guide for Linux Instances*.

Enable SAC and the boot menu

Note

If you enable SAC on an instance, the EC2 services that rely on password retrieval will not work from the Amazon EC2 console. Windows on Amazon EC2 launch agents (EC2Config, EC2Launch v1, and EC2Launch v2) rely on the serial console to execute various tasks. These tasks do not perform successfully when you enable SAC on an instance. For more information about Windows on Amazon EC2 launch agents, see [Configure your Windows instance](#). If you enable SAC, you can disable it later. For more information, see [Disable SAC and the boot menu](#).

Use one of the following methods to enable SAC and the boot menu on an instance.

PowerShell

To enable SAC and the boot menu on a Windows instance

1. [Connect](#) to your instance and perform the following steps from an elevated PowerShell command line.
2. Enable SAC.

```
bcdedit /ems '{current}' on  
bcdedit /emssettings EMSPORT:1 EMSBAUDRATE:115200
```

3. Enable the boot menu.

```
bcdedit /set '{bootmgr}' displaybootmenu yes  
bcdedit /set '{bootmgr}' timeout 15  
bcdedit /set '{bootmgr}' bootechos yes
```

4. Apply the updated configuration by rebooting the instance.

```
shutdown -r -t 0
```

Command prompt

To enable SAC and the boot menu on a Windows instance

1. [Connect](#) to your instance and perform the following steps from the command prompt.
2. Enable SAC.

```
bcdedit /ems {current} on  
bcdedit /emssettings EMSPORT:1 EMSBAUDRATE:115200
```

3. Enable the boot menu.

```
bcdedit /set {bootmgr} displaybootmenu yes  
bcdedit /set {bootmgr} timeout 15  
bcdedit /set {bootmgr} bootechos yes
```

4. Apply the updated configuration by rebooting the instance.

```
shutdown -r -t 0
```

Configure access to the EC2 Serial Console

To configure access to the serial console, you must grant serial console access at the account level and then configure IAM policies to grant access to your users.

Before commencing, be sure to check the [prerequisites](#).

Topics

- [Levels of access to the EC2 Serial Console](#)
- [Manage account access to the EC2 Serial Console](#)

- [Configure IAM policies for EC2 Serial Console access](#)

Levels of access to the EC2 Serial Console

By default, there is no access to the serial console at the account level. You need to explicitly grant access to the serial console at the account level. For more information, see [Manage account access to the EC2 Serial Console](#).

You can use a service control policy (SCP) to allow access to the serial console within your organization. You can then have granular access control at the user level by using an IAM policy to control access. By using a combination of SCP and IAM policies, you have different levels of access control to the serial console.

Organization level

You can use a service control policy (SCP) to allow access to the serial console for member accounts within your organization. For more information about SCPs, see [Service control policies](#) in the *AWS Organizations User Guide*.

Instance level

You can configure the serial console access policies by using IAM PrincipalTag and ResourceTag constructions and by specifying instances by their ID. For more information, see [Configure IAM policies for EC2 Serial Console access](#).

User level

You can configure access at the user level by configuring an IAM policy to allow or deny a specified user the permission to push the SSH public key to the serial console service of a particular instance. For more information, see [Configure IAM policies for EC2 Serial Console access](#).

Manage account access to the EC2 Serial Console

By default, there is no access to the serial console at the account level. You need to explicitly grant access to the serial console at the account level.

Topics

- [Grant permission to users to manage account access](#)
- [View account access status to the serial console](#)

- [Grant account access to the serial console](#)
- [Deny account access to the serial console](#)

Grant permission to users to manage account access

To allow your users to manage account access to the EC2 serial console, you need to grant them the required IAM permissions.

The following policy grants permissions to view the account status, and to allow and prevent account access to the EC2 serial console.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:GetSerialConsoleAccessStatus",  
                "ec2:EnableSerialConsoleAccess",  
                "ec2:DisableSerialConsoleAccess"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

For more information, see [Creating IAM policies in the IAM User Guide](#).

View account access status to the serial console

To view account access status to the serial console (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the left navigation pane, choose **EC2 Dashboard**.
3. From **Account attributes**, choose **EC2 Serial Console**.

The **EC2 Serial Console access** field indicates whether account access is **Allowed** or **Prevented**.

The following screenshot shows that the account is prevented from using the EC2 serial console.

The screenshot shows the 'EC2 Serial Console' settings page. At the top, there are tabs for 'EBS encryption', 'Zones', 'Default credit specification', 'EC2 Serial Console' (which is highlighted in orange), and 'Console experiments'. Below the tabs, there's a section titled 'EC2 Serial Console' with an 'Info' link. It says 'Allow or prevent access to your EC2 instances via the EC2 Serial Console for your account.' There are two buttons: 'Edit' (with a pencil icon) and 'Manage'. Underneath this, it says 'EC2 Serial Console access' and shows a status of 'Prevented' with a crossed-out icon.

To view account access status to the serial console (AWS CLI)

Use the [get-serial-console-access-status](#) command to view account access status to the serial console.

```
aws ec2 get-serial-console-access-status --region us-east-1
```

In the following output, true indicates that the account is allowed access to the serial console.

```
{  
    "SerialConsoleAccessEnabled": true  
}
```

Grant account access to the serial console

To grant account access to the serial console (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the left navigation pane, choose **EC2 Dashboard**.
3. From **Account attributes**, choose **EC2 Serial Console**.
4. Choose **Manage**.
5. To allow access to the EC2 serial console of all instances in the account, select the **Allow** check box.
6. Choose **Update**.

To grant account access to the serial console (AWS CLI)

Use the [enable-serial-console-access](#) command to allow account access to the serial console.

```
aws ec2 enable-serial-console-access --region us-east-1
```

In the following output, true indicates that the account is allowed access to the serial console.

```
{  
    "SerialConsoleAccessEnabled": true  
}
```

Deny account access to the serial console

To deny account access to the serial console (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the left navigation pane, choose **EC2 Dashboard**.
3. From **Account attributes**, choose **EC2 Serial Console**.
4. Choose **Manage**.
5. To prevent access to the EC2 serial console of all instances in the account, clear the **Allow** check box.
6. Choose **Update**.

To deny account access to the serial console (AWS CLI)

Use the [disable-serial-console-access](#) command to prevent account access to the serial console.

```
aws ec2 disable-serial-console-access --region us-east-1
```

In the following output, false indicates that the account is denied access to the serial console.

```
{  
    "SerialConsoleAccessEnabled": false  
}
```

Configure IAM policies for EC2 Serial Console access

By default, your users do not have access to the serial console. Your organization must configure IAM policies to grant your users the required access. For more information, see [Creating IAM policies](#) in the *IAM User Guide*.

For serial console access, create a JSON policy document that includes the `ec2-instance-connect:SendSerialConsoleSSHPublicKey` action. This action grants a user permission to push the public key to the serial console service, which starts a serial console session. We recommend restricting access to specific EC2 instances. Otherwise, all users with this permission can connect to the serial console of all EC2 instances.

Example IAM policies

- Explicitly allow access to the serial console
 - Explicitly deny access to the serial console
 - Use resource tags to control access to the serial console

Explicitly allow access to the serial console

By default, no one has access to the serial console. To grant access to the serial console, you need to configure a policy to explicitly allow access. We recommend configuring a policy that restricts access to specific instances.

The following policy allows access to the serial console of a specific instance, identified by its instance ID.

Note that the `DescribeInstances`, `DescribeInstanceTypes`, and `GetSerialConsoleAccessStatus` actions do not support resource-level permissions, and therefore all resources, indicated by the * (asterisk), must be specified for these actions.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowDescribeInstances",
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeInstances",
                "ec2:DescribeInstanceTypes"
            ]
        }
    ]
}
```

```
        "ec2:GetSerialConsoleAccessStatus"
    ],
    "Resource": "*"
},
{
    "Sid": "AllowinstanceBasedSerialConsoleAccess",
    "Effect": "Allow",
    "Action": [
        "ec2-instance-connect:SendSerialConsoleSSHPublicKey"
    ],
    "Resource": "arn:aws:ec2:region:account-id:instance/i-0598c7d356eba48d7"
}
]
```

Explicitly deny access to the serial console

The following IAM policy allows access to the serial console of all instances, denoted by the * (asterisk), and explicitly denies access to the serial console of a specific instance, identified by its ID.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowSerialConsoleAccess",
            "Effect": "Allow",
            "Action": [
                "ec2-instance-connect:SendSerialConsoleSSHPublicKey",
                "ec2:DescribeInstances",
                "ec2:DescribeInstanceTypes",
                "ec2:GetSerialConsoleAccessStatus"
            ],
            "Resource": "*"
        },
        {
            "Sid": "DenySerialConsoleAccess",
            "Effect": "Deny",
            "Action": [
                "ec2-instance-connect:SendSerialConsoleSSHPublicKey"
            ],
            "Resource": "arn:aws:ec2:region:account-id:instance/i-0598c7d356eba48d7"
        }
    ]
}
```

```
}
```

Use resource tags to control access to the serial console

You can use resource tags to control access to the serial console of an instance.

Attribute-based access control is an authorization strategy that defines permissions based on tags that can be attached to users and AWS resources. For example, the following policy allows a user to initiate a serial console connection for an instance only if that instance's resource tag and the principal's tag have the same `SerialConsole` value for the tag key.

For more information about using tags to control access to your AWS resources, see [Controlling access to AWS resources](#) in the *IAM User Guide*.

Note that the `DescribeInstances`, `DescribeInstanceTypes`, and `GetSerialConsoleAccessStatus` actions do not support resource-level permissions, and therefore all resources, indicated by the * (asterisk), must be specified for these actions.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowDescribeInstances",
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeInstances",
                "ec2:DescribeInstanceTypes",
                "ec2:GetSerialConsoleAccessStatus"
            ],
            "Resource": "*"
        },
        {
            "Sid": "AllowTagBasedSerialConsoleAccess",
            "Effect": "Allow",
            "Action": [
                "ec2-instance-connect:SendSerialConsoleSSHPublicKey"
            ],
            "Resource": "arn:aws:ec2:region:account-id:instance/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/SerialConsole":
                    "${aws:PrincipalTag/SerialConsole}"
                }
            }
        }
    ]
}
```

```
        }
    }
}
```

Connect to the EC2 Serial Console

You can connect to the serial console of your EC2 instance by using the Amazon EC2 console or via SSH. After connecting to the serial console, you can use it for troubleshooting boot, network configuration, and other issues. For more information about troubleshooting, see [Troubleshoot your Windows instance using the EC2 Serial Console](#).

Considerations

- Only 1 active serial console connection is supported per instance.
- The serial console connection typically lasts for 1 hour unless you disconnect from it. However, during system maintenance, Amazon EC2 will disconnect the serial console session.
- It takes 30 seconds to tear down a session after you've disconnected from the serial console in order to allow a new session.
- Supported serial console port for Windows: COM1
- When you connect to the serial console, you might observe a slight drop in your instance's throughput.

Topics

- [Connect using the browser-based client](#)
- [Connect using your own key and SSH client](#)
- [EC2 Serial Console endpoints and fingerprints](#)

Connect using the browser-based client

You can connect to your EC2 instance's serial console by using the browser-based client. You do this by selecting the instance in the Amazon EC2 console and choosing to connect to the serial console. The browser-based client handles the permissions and provides a successful connection.

EC2 serial console works from most browsers, and supports keyboard and mouse input.

Before connecting, make sure you have completed the [prerequisites](#).

To connect to your instance's serial port using the browser-based client (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, EC2 Serial Console, Connect**.

Alternatively, select the instance and choose **Connect, EC2 Serial Console, Connect**.

An in-browser terminal window opens.

4. Press **Enter**. If a login prompt returns, you are connected to the serial console.

If the screen remains black, you can use the following information to help resolve issues with connecting to the serial console:

- **Check that you have configured access to the serial console.** For more information, see [Configure access to the EC2 Serial Console](#).
- **Reboot your instance.** You can reboot your instance by using the EC2 console or the AWS CLI. For more information, see [Reboot your instance](#).

Connect using your own key and SSH client

You can use your own SSH key and connect to your instance from the SSH client of your choice while using the serial console API. This enables you to benefit from the serial console capability to push a public key to the instance.

Before connecting, make sure you have completed the [prerequisites](#).

To connect to an instance's serial console using SSH

1. **Push your SSH public key to the instance to start a serial console session**

Use the [send-serial-console-ssh-public-key](#) command to push your SSH public key to the instance. This starts a serial console session.

If a serial console session has already been started for this instance, the command fails because you can only have one session open at a time. It takes 30 seconds to tear down a session after you've disconnected from the serial console in order to allow a new session.

```
C:\> aws ec2-instance-connect send-serial-console-ssh-public-key \
--instance-id i-001234a4bf70dec41EXAMPLE \
--serial-port 0 \
--ssh-public-key file://my_key.pub \
--region us-east-1
```

2. Connect to the serial console using your private key

Use the **ssh** command to connect to the serial console before the public key is removed from the serial console service. You have 60 seconds before it is removed.

Use the private key that corresponds to the public key.

The user name format is `instance-id.port0`, which comprises the instance ID and port 0. In the following example, the user name is `i-001234a4bf70dec41EXAMPLE.port0`.

The endpoint of the serial console service is different for each Region. See the [EC2 Serial Console endpoints and fingerprints](#) table for each Region's endpoint. In the following example, the serial console service is in the us-east-1 Region.

```
C:\> ssh -i my_key i-001234a4bf70dec41EXAMPLE.port0@serial-console.ec2-instance-connect.us-east-1.aws
```

3. (Optional) Verify the fingerprint

When you connect for the first time to the serial console, you are prompted to verify the fingerprint. You can compare the serial console fingerprint with the fingerprint that's displayed for verification. If these fingerprints don't match, someone might be attempting a "man-in-the-middle" attack. If they match, you can confidently connect to the serial console.

The following fingerprint is for the serial console service in the us-east-1 Region. For the fingerprints for each Region, see [EC2 Serial Console endpoints and fingerprints](#).

```
SHA256:dXwn5ma/xadVMeBZGEru512gx+yI5LDiJaLUCz0FMmw
```

Note

The fingerprint only appears the first time you connect to the serial console.

4. Press **Enter**. If a prompt returns, you are connected to the serial console.

If the screen remains black, you can use the following information to help resolve issues with connecting to the serial console:

- **Check that you have configured access to the serial console.** For more information, see [Configure access to the EC2 Serial Console](#).
- **Reboot your instance.** You can reboot your instance by using the EC2 console or the AWS CLI. For more information, see [Reboot your instance](#).

EC2 Serial Console endpoints and fingerprints

The following are the service endpoints and fingerprints for EC2 Serial Console. To connect programmatically to an instance's serial console, you use an EC2 Serial Console endpoint. The EC2 Serial Console endpoints and fingerprints are unique for each AWS Region.

Region Name	Region	Endpoint	Fingerprint
US East (Ohio)	us-east-2	serial-console.ec2-instance-connect.us-east-2.aws	SHA256:EhwPkTzRtTY7TRSzz26XbB0/HvV9jRM7mCZN0xwd/0
US East (N. Virginia)	us-east-1	serial-console.ec2-instance-connect.us-east-1.aws	SHA256:dXwn5ma/xadVMeBZGEru5l2gx+yI5LDiJaLUCzOFMmw

Disconnect from the EC2 Serial Console

If you no longer need to be connected to your instance's EC2 Serial Console, you can disconnect from it. When you disconnect from the serial console, any shell session running on the instance will continue to run. If you want to end the shell session, you'll need to end it before disconnecting from the serial console.

Considerations

- The serial console connection typically lasts for 1 hour unless you disconnect from it. However, during system maintenance, Amazon EC2 will disconnect the serial console session.
- It takes 30 seconds to tear down a session after you've disconnected from the serial console in order to allow a new session.

The way to disconnect from the serial console depends on the client.

Browser-based client

To disconnect from the serial console, close the serial console in-browser terminal window.

Standard OpenSSH client

To disconnect from the serial console, use the following command to close the SSH connection. This command must be run immediately following a new line.

```
C:\> ~.
```

The command that you use for closing an SSH connection might be different depending on the SSH client that you're using.

Troubleshoot your Windows instance using the EC2 Serial Console

By using EC2 Serial Console, you can troubleshoot boot, network configuration, and other issues by connecting to your instance's serial port.

Before commencing, be sure to check the [prerequisites](#).

Topics

- [Use SAC to troubleshoot your Windows instance](#)

For information about troubleshooting your Linux instance, see [Troubleshoot your Linux instance using the EC2 Serial Console](#) in the *Amazon EC2 User Guide for Linux Instances*.

Use SAC to troubleshoot your Windows instance

The Special Admin Console (SAC) capability of Windows provides a way to troubleshoot a Windows instance. By connecting to the instance's serial console and using SAC, you can interrupt the boot process and boot Windows in safe mode.

Before you can use SAC, make sure you have completed the [prerequisites](#), which include granting access to the serial console and enabling SAC and the boot menu.

Note

If you enable SAC on an instance, the EC2 services that rely on password retrieval will not work from the Amazon EC2 console. Windows on Amazon EC2 launch agents (EC2Config, EC2Launch v1, and EC2Launch v2) rely on the serial console to execute various tasks.

These tasks do not perform successfully when you enable SAC on an instance. For more information about Windows on Amazon EC2 launch agents, see [Configure your Windows instance](#). If you enable SAC, you can disable it later. For more information, see [Disable SAC and the boot menu](#).

Topics

- [Use SAC](#)
- [Use the boot menu](#)
- [Disable SAC and the boot menu](#)

Use SAC

To use SAC

1. [Connect to the serial console.](#)

If SAC is enabled on the instance, the serial console displays the SAC> prompt.

```
Computer is booting, SAC started and initialized.  
Use the "ch -?" command for information about using channels.  
Use the "?" command for general help.  
  
SAC>?  
EVENT: The CMD command is now available.  
SAC->
```

2. To display the SAC commands, enter ?, and then press **Enter**.

Expected output

```
SAC>?  
ch                      Channel management commands.  Use ch -? for more help.  
cmd                     Create a Command Prompt channel.  
d                        Dump the current kernel log.  
f                        Toggle detailed or abbreviated tlist info.  
? or help                Display this list.  
i                        List all IP network numbers and their IP addresses.  
i <#> <ip> <subnet> <gateway> Set IPv4 addr., subnet and gateway.  
id                       Display the computer identification information.  
k <pid>                 Kill the given process.  
l <pid>                 Lower the priority of a process to the lowest possible.  
lock                     Lock access to Command Prompt channels.  
m <pid> <MB-allow>    Limit the memory usage of a process to <MB-allow>.  
p                        Toggle paging the display.  
r <pid>                 Raise the priority of a process by one.  
s                        Display the current time and date (24 hour clock used).  
s mm/dd/yyyy hh:mm      Set the current time and date (24 hour clock used).  
t                        Tlist.  
restart                  Restart the system immediately.  
shutdown                 Shutdown the system immediately.  
crashdump               Crash the system. You must have crash dump enabled.
```

3. To create a command prompt channel (such as cmd0001 or cmd0002), enter **cmd**, and then press **Enter**.
4. To view the command prompt channel, press **ESC**, and then press **TAB**.

Expected output

```
Name: Cmd0001
Description: Command
Type: VT-UTF8
Channel GUID: ef9f20a0-1287-11eb-82b0-0e4ba51872e5
Application Type GUID: 63d02271-8aa4-11d5-bccf-00b0d014a2d0

Press <esc><tab> for next channel.
Press <esc><tab>0 to return to the SAC channel.
Use any other key to view this channel.
```

5. To switch channels, press **ESC+TAB+channel number** together. For example, to switch to the cmd0002 channel (if it has been created), press **ESC+TAB+2**.
6. Enter the credentials required by the command prompt channel.

```
Please enter login credentials.
Username: Administrator
Domain : .
Password: *****
```

The command prompt is the same full-featured command shell that you get on a desktop, but with the exception that it does not allow the reading of characters that were already output.

PS C:\Windows\system32> -
```

Use the boot menu

If the instance has the boot menu enabled and is restarted after connecting via SSH, you should see the boot menu, as follows.

Boot menu commands

ENTER

Starts the selected entry of the operating system.

TAB

Switches to the Tools menu.

ESC

Cancels and restarts the instance.

ESC followed by 8

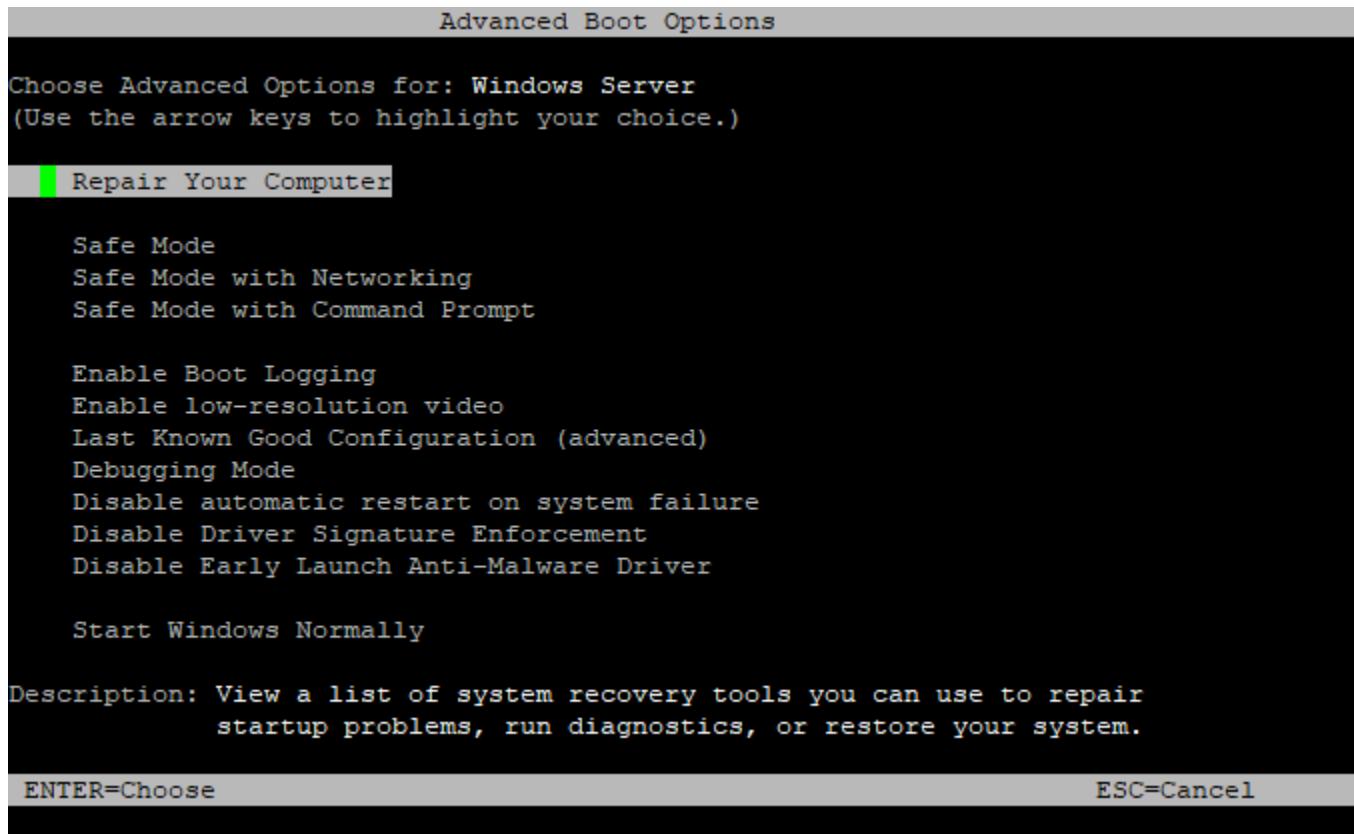

Equivalent to pressing **F8**. Shows advanced options for the selected item.

ESC key + left arrow

Goes back to the initial boot menu.

 **Note**

The ESC key alone does not take you back to the main menu because Windows is waiting to see if an escape sequence is in progress.

Disable SAC and the boot menu

If you enable SAC and the boot menu, you can disable these features later.

Use one of the following methods to disable SAC and the boot menu on an instance.

PowerShell

To disable SAC and the boot menu on a Windows instance

1. [Connect](#) to your instance and perform the following steps from an elevated PowerShell command line.
2. First disable the boot menu by changing the value to no.

```
bcdedit /set '{bootmgr}' displaybootmenu no
```

3. Then disable SAC by changing the value to off.

```
bcdedit /ems '{current}' off
```

4. Apply the updated configuration by rebooting the instance.

```
shutdown -r -t 0
```

Command prompt

To disable SAC and the boot menu on a Windows instance

1. [Connect](#) to your instance and perform the following steps from the command prompt.
2. First disable the boot menu by changing the value to no.

```
bcdedit /set {bootmgr} displaybootmenu no
```

3. Then disable SAC by changing the value to off.

```
bcdedit /ems {current} off
```

4. Apply the updated configuration by rebooting the instance.

```
shutdown -r -t 0
```

Send a diagnostic interrupt (for advanced users)

Warning

Diagnostic interrupts are intended for use by advanced users. Incorrect usage could negatively impact your instance. Sending a diagnostic interrupt to an instance could trigger an instance to crash and reboot, which could lead to the loss of data.

You can send a diagnostic interrupt to an unreachable or unresponsive Windows instance to manually trigger a *stop error*. Stop errors are commonly referred to as *blue screen errors*.

In general, Windows operating systems crash and reboot when a stop error occurs, but the specific behavior depends on its configuration. A stop error can also cause the operating system to write debugging information, such as a kernel memory dump, to a file. You can then use this information to conduct root cause analysis to debug the instance.

The memory dump data is generated locally by the operating system on the instance itself.

Before sending a diagnostic interrupt to your instance, we recommend that you consult the documentation for your operating system and then make the necessary configuration changes.

Contents

- [Supported instance types](#)
- [Prerequisites](#)
- [Send a diagnostic interrupt](#)

Supported instance types

Diagnostic interrupt is supported on all Nitro-based instance types, except those powered by AWS Graviton processors. For more information, see [instances built on the AWS Nitro System](#) and [AWS Graviton](#).

Prerequisites

Before using a diagnostic interrupt, you should configure your instance's operating system to perform the actions you need when a stop error occurs.

To configure Windows to generate a memory dump when a stop error occurs

1. Connect to your instance.
2. Open the **Control Panel** and choose **System, Advanced system settings**.
3. In the **System Properties** dialog box, choose the **Advanced** tab.
4. In the **Startup and Recovery** section, choose **Settings....**
5. In the **System failure** section, configure the settings as needed, and then choose **OK**.

For more information about configuring Windows stop errors, see [Overview of memory dump file options for Windows](#).

Send a diagnostic interrupt

After you have completed the necessary configuration changes, you can send a diagnostic interrupt to your instance using the AWS CLI or Amazon EC2 API.

To send a diagnostic interrupt to your instance (AWS CLI)

Use the [send-diagnostic-interrupt](#) command and specify the instance ID.

```
aws ec2 send-diagnostic-interrupt --instance-id i-1234567890abcdef0
```

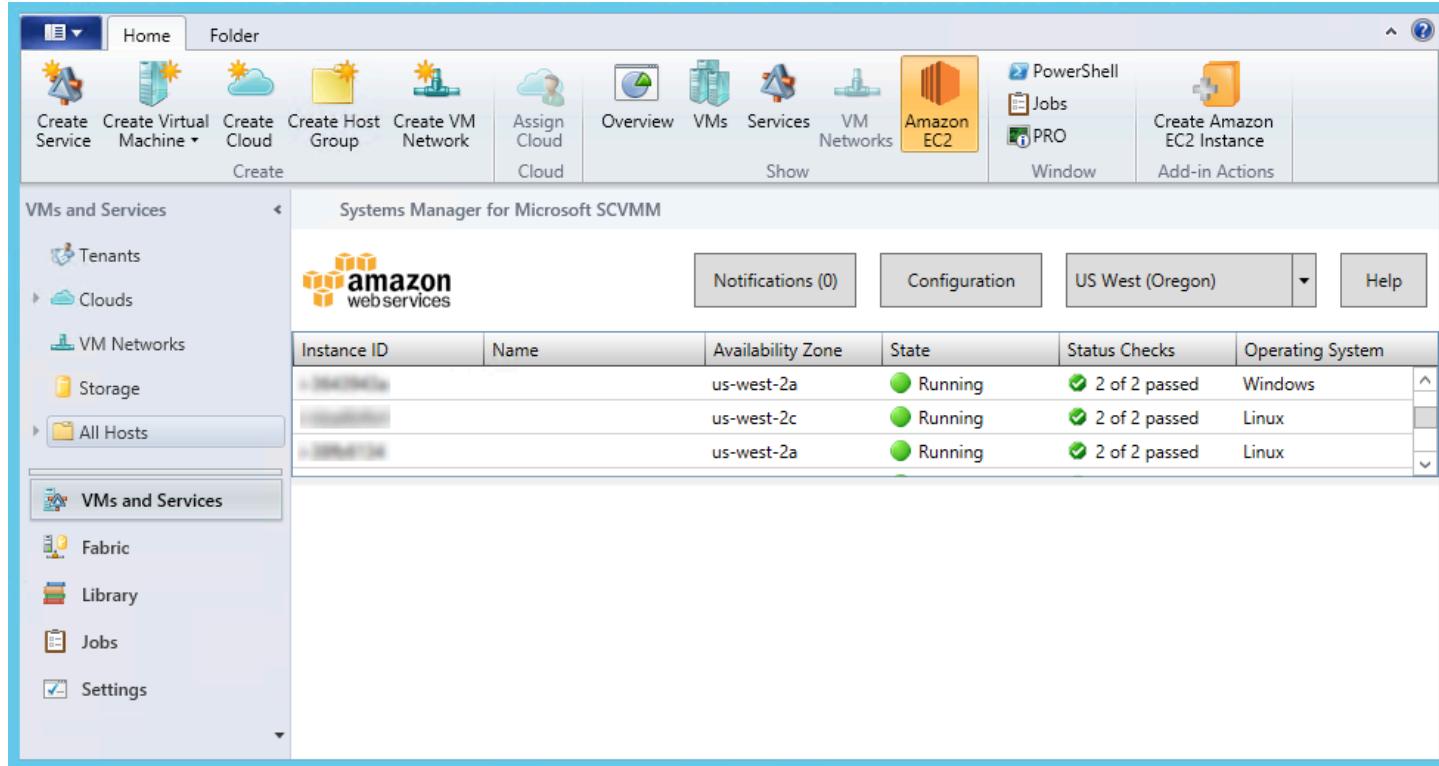

To send a diagnostic interrupt to your instance (AWS Tools for Windows PowerShell)

Use the [Send-EC2DiagnosticInterrupt](#) cmdlet and specify the instance ID.

```
PS C:\> Send-EC2DiagnosticInterrupt -InstanceId i-1234567890abcdef0
```

AWS Systems Manager for Microsoft System Center VMM

AWS Systems Manager for Microsoft System Center Virtual Machine Manager (SCVMM) provides a simple, easy-to-use interface for managing AWS resources, such as EC2 instances, from Microsoft SCVMM. It is implemented as an add-in for the VMM console. For more information, see [AWS Add-ins for Microsoft System Center](#).

Features

- Administrators can grant permissions to users so that they can manage EC2 instances from SCVMM.
- Users can launch, view, reboot, stop, start, and terminate instances, if they have the required permissions.
- Users can get the passwords for their Windows instances and connect to them using RDP.
- Users can get the public DNS names for their Linux instances and connect to them using SSH.
- Users can import their Hyper-V Windows virtual machines from SCVMM to Amazon EC2.

Limitations

- Users must have an account that they can use to log in to SCVMM.
- You can't import Linux virtual machines from SCVMM to Amazon EC2.
- This is not a comprehensive tool for creating and managing AWS resources. The add-in enables SCVMM users to get started quickly with the basic tasks for managing their EC2 instances. Future releases might support managing additional AWS resources.

Requirements

- An AWS account
- Microsoft System Center VMM 2012 R2 or System Center VMM 2012 SP1 with the latest update roll-up

Get started

To get started, see the following documentation:

- [Setting Up](#)
- [Managing EC2 Instances](#)
- [Troubleshooting](#)

Set up AWS Systems Manager for Microsoft SCVMM

When you set up AWS Systems Manager, users in your organization can access your AWS resources. The process involves creating accounts, deploying the add-in, and providing your credentials.

Tasks

- [Sign up for AWS](#)
- [Set up access for users](#)
- [Deploy the add-in](#)
- [Provide your AWS credentials](#)

Sign up for AWS

When you sign up for Amazon Web Services, your AWS account is automatically signed up for all services in AWS. You are charged only for the services that you use.

If you have an AWS account already, skip to the next task. If you don't have an AWS account, see [Sign up for an AWS account](#) for instructions on how to create one.

Set up access for users

The first time that you use Systems Manager, you must provide AWS credentials. To enable multiple users to access the same AWS account using unique credentials and permissions, create a user for each user. You can create one or more groups with policies that grant permissions to perform limited tasks. Then you can create one or more users, and add each user to the appropriate group.

To create an Administrators group

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Groups** and then choose **Create New Group**.
3. In the **Group Name** box, specify **Administrators** and then choose **Next Step**.
4. On the **Attach Policy** page, select the **AdministratorAccess** AWS managed policy.
5. Choose **Next Step** and then choose **Create Group**.

To create a group with limited access to Amazon EC2

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Groups** and then choose **Create New Group**.
3. In the **Group Name** box, specify a meaningful name for the group and then choose **Next Step**.
4. On the **Attach Policy** page, do not select an AWS managed policy — choose **Next Step**, and then choose **Create Group**.
5. Choose the name of the group you've just created. On the **Permissions** tab, choose **Inline Policies**, and then **click here**.
6. Select the **Custom Policy** radio button and then choose **Select**.

7. Enter a name for the policy and a policy document that grants limited access to Amazon EC2, and then choose **Apply Policy**. For example, you can specify one of the following custom policies.

Grant users in this group permission to view information about EC2 instances only

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:Describe*",  
                "iam>ListInstanceProfiles"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

Grant users in this group permission to perform all operations on EC2 instances that are supported by the add-in

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "iam>ListInstanceProfiles",  
                "ec2:Describe*", "ec2>CreateKeyPair",  
                "ec2>CreateTags", "ec2>DeleteTags",  
                "ec2>RunInstances", "ec2>GetPasswordData",  
                "ec2>RebootInstances", "ec2>StartInstances",  
                "ec2>StopInstances", "ec2>TerminateInstances"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

Grant users in this group permission to import a VM to Amazon EC2

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "s3>ListAllMyBuckets", "s3>CreateBucket",  
                "s3>DeleteBucket", "s3>DeleteObject",  
                "s3>GetBucketLocation", "s3>GetObject",  
                "s3>ListBucket", "s3>PutObject",  
                "ec2>DescribeTags", "ec2>CancelConversionTask",  
                "ec2>DescribeConversionTasks", "ec2>DescribeInstanceAttribute",  
                "ec2>CreateImage", "ec2>AttachVolume",  
                "ec2>ImportInstance", "ec2>ImportVolume",  
                "dynamodb>DescribeTable", "dynamodb>CreateTable",  
                "dynamodb>Scan", "dynamodb>PutItem", "dynamodb>UpdateItem"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

To create a user, get the user's AWS credentials, and grant the user permissions

Users need programmatic access if they want to interact with AWS outside of the AWS Management Console. The way to grant programmatic access depends on the type of user that's accessing AWS.

To grant users programmatic access, choose one of the following options.

Which user needs programmatic access?	To	By
Workforce identity (Users managed in IAM Identity Center)	Use temporary credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.	Following the instructions for the interface that you want to use. <ul style="list-style-type: none">For the AWS CLI, see Configuring the AWS CLI to use AWS IAM

Which user needs programmatic access?	To	By
		<p>Identity Center in the <i>AWS Command Line Interface User Guide</i>.</p> <ul style="list-style-type: none">• For AWS SDKs, tools, and AWS APIs, see IAM Identity Center authentication in the <i>AWS SDKs and Tools Reference Guide</i>.
IAM	Use temporary credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.	<p>Following the instructions in Using temporary credentials with AWS resources in the <i>IAM User Guide</i>.</p>
IAM	(Not recommended) Use long-term credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.	<p>Following the instructions for the interface that you want to use.</p> <ul style="list-style-type: none">• For the AWS CLI, see Authenticating using IAM user credentials in the <i>AWS Command Line Interface User Guide</i>.• For AWS SDKs and tools, see Authenticate using long-term credentials in the <i>AWS SDKs and Tools Reference Guide</i>.• For AWS APIs, see Managing access keys for IAM users in the <i>IAM User Guide</i>.

Deploy the add-in

Add-ins for System Center VMM are distributed as .zip files. To deploy the add-in, use the following procedure.

To deploy the add-in

1. From your instance, go to [AWS Systems Manager for Microsoft System Center Virtual Machine Manager](#) and click **SCVMM**. Save the aws-systems-manager-1.5.zip file to your instance.
2. Open the VMM console.
3. In the navigation pane, click **Settings** and then click **Console Add-Ins**.
4. On the ribbon, click **Import Console Add-in**.
5. On the **Select an Add-in** page, click **Browse** and select the aws-systems-manager-1.5.zip file for the add-in that you downloaded.
6. Ignore any warnings that there are assemblies in the add-in that are not signed by a trusted authority. Select **Continue installing this add-in anyway** and then click **Next**.
7. On the **Summary** page, click **Finish**.
8. When the add-in is imported, the status of the job is **Completed**. You can close the **Jobs** window.

Provide your AWS credentials

When you use the Systems Manager for the first time, you must provide your AWS credentials. Your access keys identify you to AWS. There are two types of access keys: access key IDs (for example, AKIAIOSFODNN7EXAMPLE) and secret access keys (for example, wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY). You should have stored your access keys in a safe place when you received them.

To provide your AWS credentials

1. Open the VMM console.
2. In the navigation pane, click **VMs and Services**.
3. On the ribbon, click **Amazon EC2**.
4. On the **Credentials** tab, specify your AWS credentials, select a default region, and then click **Save**.

Amazon Web Services Systems Manager for Microsoft SCVMM

Credentials VM Import Advanced About

Access key id: AKIAIOSFODNN7EXAMPLE

Secret access key: wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY

Participate in the Amazon Web Services Systems Manager customer experience program

Clear credentials

For more information on setting up credentials: [Systems Manager User Credentials](#)

Save **Cancel**

To change these credentials at any time, click **Configuration**.

Manage EC2 instances using AWS Systems Manager for Microsoft SCVMM

After you log in to the Systems Manager console using your AWS credentials, you can manage your EC2 instances.

Tasks

- [Create an EC2 Instance](#)
- [View your instances](#)
- [Connect to your instance](#)

- [Reboot your instance](#)
- [Stop your instance](#)
- [Start your instance](#)
- [Terminate your instance](#)

Create an EC2 Instance

The permissions that you've been granted by your administrator determine whether you can create instances.

Prerequisites

- A virtual private cloud (VPC) with a subnet in the Availability Zone where you'll launch the instance. For more information about creating a VPC, see the [Amazon VPC Getting Started Guide](#).

To create an EC2 instance

1. Open SCVMM.
2. On the ribbon, click **Create Amazon EC2 Instance**.
3. Complete the **Create Amazon EC2 Instance** dialog box as follows:
 - a. Select a Region for your instance. By default, we select the Region that you configured as your default Region.
 - b. Select a template (known as an AMI) for your instance. To use an AMI provided by Amazon, select **Windows** or **Linux** and then select an AMI from **Image**. To use an AMI that you created, select **My images** and then select the AMI from **Image**.
 - c. Select an instance type for the instance. First, select one of the latest instance families from **Family**, and then select an instance type from **Instance type**. To include previous generation instance families in the list, select **Show previous generations**. For more information, see [Amazon EC2 Instances](#) and [Previous Generation Instances](#).
 - d. Create or select a key pair. To create a key pair, select **Create a new key pair** from **Key pair name** and enter a name for the key pair in the highlighted field (for example, **my-key-pair**).
 - e. (Optional) Under **Advanced settings**, specify a display name for the instance.

- f. (Optional) Under **Advanced settings**, select a VPC from **Network (VPC)**. Note that this list includes all VPCs for the region, including VPCs created using the Amazon VPC console and the default VPC (if it exists). If you have a default VPC in this region, we select it by default. If the text is "There is no VPC available for launch or import operations in this region", then you must create a VPC in this Region using the Amazon VPC console.
- g. (Optional) Under **Advanced settings**, select a subnet from **Subnet**. Note that this list includes all subnets for the selected VPC, including any default subnets. If this list is empty, you must add a subnet to the VPC using the Amazon VPC console, or select a different VPC. Otherwise, we select a subnet for you.
- h. (Optional) Under **Advanced settings**, create a security group or select one or more security groups. If you select **Create default security group**, we create a security group that grants RDP and SSH access to everyone, which you can modify using the Amazon EC2 or Amazon VPC console. You can enter a name for this security group in the **Group name** box.
- i. (Optional) Under **Advanced settings**, select an IAM role. If this list is empty, you can create a role using the IAM console.

Create Amazon EC2 Instance

To launch one new instance, complete the fields, and then click Create.

Region: US West (Oregon)

Operating system: Windows Linux My images

Image: Microsoft Windows Server 2012 R2 Base (ami-29d18719)

Family: General purpose Show previous generations

Instance type: m3.medium vCPUs: 1 Memory: 3.75 GB

Key pair name: Create a new key pair my-key-pair

Advanced settings

Name: my-instance

Root volume: General Purpose (SSD) Size (GiB): 30

Network (VPC): vpc-98eb5ef5 (10.0.0.0/16)

Subnet: subnet-6bea5f06 (10.0.0.0/24) (us-west-2c)

Security groups: Create default security group
sg-8422d1eb (default)
sg-7b845f14 (my-security-group)

Group name:

IAM role: my-iam-role

Create **Cancel**

- Click **Create**. If you are creating a key pair, you are prompted to save the .pem file. Save this file in a secure place; you'll need it to log in to your instance. You'll receive confirmation that the instance has launched. Click **Close**.

After you've created your instance, it appears in the list of instances for the Region in which you launched it. Initially, the status of the instance is pending. After the status changes to running, your instance is ready for use.

You can manage the lifecycle of your instance using Systems Manager, as described on this page. To perform other tasks, such as the following, you must use the AWS Management Console:

- [Attach an Amazon EBS volume to your instance](#)
- [Associate an Elastic IP address with your instance](#)
- [Enable termination protection](#)

View your instances

The permissions that your administrator grants you determine whether you can view instances and get detailed information about them.

To view your instances and get detailed information

1. Open the [AWS Systems Manager console](#).
2. From the list of Regions, select a Region.
3. From the list of instances, select one or more instances.
4. In the lower pane, click the down arrow next to each instance to view detailed information about the instance.

^ i-343e9f3a (my-instance)

Subnet ID:	subnet-c9663da0
Network interfaces:	eni-89b0bed0

Connect to your instance

You can log in to an EC2 instance if you have the private key (. pem file) for the key pair that was specified when launching the instance. The tool that you'll use to connect to your instance depends on whether the instance is a Windows instance or a Linux instance.

To connect to a Windows EC2 instance

1. Open AWS Systems Manager.
2. From the list of instances, select the instance, right-click, and then click **Retrieve Windows Password**.
3. In the **Retrieve Default Windows Administrator Password** dialog box, click **Browse**. Select the private key file for the key pair and then click **Open**.
4. Click **Decrypt Password**. Save the password or copy it to the clipboard.
5. Select the instance, right-click, and then click **Connect via RDP**. When prompted for credentials, use the name of the administrator account and the password that you saved in the previous step.
6. Because the certificate is self-signed, you might get a warning that the security certificate is not from a trusted certifying authority. Click **Yes** to continue.

If the connection fails, see [Troubleshoot Windows instances](#) in the *Amazon EC2 User Guide for Windows Instances*.

To connect to a Linux EC2 instance

1. Open AWS Systems Manager.
2. From the list of instances, select the instance.
3. In the lower pane, click the down arrow next to the instance ID to view detailed information about the instance.
4. Locate the public DNS name. You'll need this information to connect to your instance.
5. Connect to the instance using PuTTY. For step-by-step instructions, see [Connect to your Linux instance from Windows using PuTTY](#) in the *Amazon EC2 User Guide for Linux Instances*.

Reboot your instance

The permissions that you've been granted by your administrator determine whether you can reboot instances.

To reboot your instance

1. Open AWS Systems Manager.
2. From the list of instances, select the instance.

3. Right-click the instance, and then click **Reset (Reboot)**.
4. When prompted for confirmation, click **Yes**.

Stop your instance

The permissions that you've been granted by your administrator determine whether you can stop instances.

To stop your instance

1. Open AWS Systems Manager.
2. From the list of instances, select the instance.
3. Right-click the instance, and then click **Shut Down (Stop)**.
4. When prompted for confirmation, click **Yes**.

Start your instance

The permissions that you've been granted by your administrator determine whether you can start instances.

To start your instance

1. Open AWS Systems Manager.
2. From the list of instances, select the instance.
3. Right-click the instance, and then click **Power On (Start)**.
4. When prompted for confirmation, click **Yes**.

If you get a quota error when you try to start an instance, you have reached your concurrent running instance limit. The default limit for your AWS account is 20. If you need additional running instances, complete the form at [Request to Increase Amazon EC2 Instance Limit](#).

Terminate your instance

The permissions that you've been granted by your administrator determine whether you can terminate instances.

To terminate your instance

1. Open AWS Systems Manager.
2. From the list of instances, select the instance.
3. Right-click the instance, and then click **Delete (Terminate)**.
4. When prompted for confirmation, click **Yes**.

Import your virtual machine using AWS Systems Manager for Microsoft SCVMM

You can launch an EC2 instance from a virtual machine that you import from SCVMM to Amazon EC2.

Important

You can't import Linux virtual machines from SCVMM to Amazon EC2.

Contents

- [Prerequisites](#)
- [Import your virtual machine](#)
- [Check the import task status](#)
- [Back up your imported instance](#)

Prerequisites

- Ensure that your VM is ready. For more information, see [Prepare Your VM](#) in the *VM Import/Export User Guide*.
- In AWS Systems Manager, click **Configuration**, select the **VM Import** tab, and review the following settings:
 - **S3 bucket prefix:** We create a bucket for disk images to be uploaded before they are imported. The name of the bucket starts with the prefix listed here and includes the Region (for example, us-east-2). To delete the disk images after they are imported, select **Clean up S3 bucket after import**.

- **VM image export path:** A location for the disk images exported from the VM. To delete the disk images after they are imported, select **Clean up export path after import**.
- **Alternate Hyper-V PowerShell module path:** The location of the Hyper-V PowerShell module, if it's not installed in the standard location. For more information, see [Installing the Hyper-V Management Tools](#).

Import your virtual machine

The permissions that you've been granted by your administrator determine whether you can import HyperV Windows virtual machines from SCVMM to AWS.

To import your virtual machine

1. Open SCVMM.
2. On the ribbon, click **VMs**. Select your virtual machine from the list.
3. On the ribbon, click **Import VM to Amazon EC2**.
4. Complete the **Import Virtual Machine** dialog box as follows:
 - a. Select a Region for the instance. By default, we select the Region that you configured as your default Region.
 - b. Select an instance type for the instance. First, select one of the latest instance families from **Family**, and then select an instance type from **Instance type**. To include previous generation instance families in the list, select **Show previous generations**. For more information, see [Amazon EC2 Instances](#) and [Previous Generation Instances](#).
 - c. Select a VPC from **Network (VPC)**. Note that this list includes all VPCs for the region, including VPCs created using the Amazon VPC console and the default VPC (if it exists). If you have a default VPC in this region, we select it by default. If the text is "There is no VPC available for launch or import operations in this region", then you must create a VPC in this region using the Amazon VPC console.
 - d. Select a subnet from **Subnet**. Note that this list includes all subnets for the selected VPC, including any default subnets. If this list is empty, you must add a subnet to the VPC using the Amazon VPC console, or select a different VPC. Otherwise, we select a subnet for you.

To import a virtual machine into Amazon EC2, complete the fields, and then click Import.

Virtual Machine

Name: my-virtual-machine
Id: 729D71D0-E0FE-414F-8C78-AE3EB549CBC6
Host: my-host
Hardware: Processors: 1 Memory: 512 MB

Amazon EC2 Options

Region: US West (Oregon)
Architecture: 64-bit 32-bit
Family: General purpose Show previous generations
Instance type: m3.xlarge vCPUs: 4 Memory: 15 GB
Network (VPC): vpc-f1663d98 (10.0.0.0/16)
Subnet: subnet-cb663da2 (10.0.1.0/24) (us-west-2c)

Import Cancel

- Click **Import**. If you haven't specified the required information in the **VM Import** tab, you'll receive an error asking you to provide the required information. Otherwise, you'll receive confirmation that the import task has started. Click **Close**.

Check the import task status

The import task can take several hours to complete. To view the current status, open AWS Systems Manager and click **Notifications**.

You'll receive the following notifications as the import task progresses:

- Import VM: Created Import VM Task
- Import VM: Export VM Disk Image Done
- Import VM: Upload to S3

- Import VM: Image Conversion Starting
- Import VM: Image Conversion Done
- Import VM: Import Complete

Note that you'll receive the Import VM: Upload to S3, Import VM: Image Conversion Starting, and Import VM: Image Conversion Done notifications for each disk image converted.

If the import task fails, you'll receive the notification Import VM: Import Failed. For more information about troubleshooting issues with import tasks, see [Errors importing a virtual machine](#).

Back up your imported instance

After the import operation completes, the instance runs until it is terminated. If your instance is terminated, you can't connect to or recover the instance. To ensure that you can start a new instance with the same software as an imported instance if needed, create an Amazon Machine Image (AMI) from the imported instance. For more information, see [Create a custom Windows AMI](#).

Troubleshoot AWS Systems Manager for Microsoft SCVMM

The following are common errors and troubleshooting steps.

Contents

- [Error: Add-in cannot be installed](#)
- [Installation errors](#)
- [Check the log file](#)
- [Errors importing a virtual machine](#)
- [Uninstall the add-in](#)

Error: Add-in cannot be installed

If you receive the following error, try installing [KB2918659](#) on the computer running the VMM console. For more information, see [Description of System Center 2012 SP1 Update Rollup 5](#).

Note that you don't need to install all the updates listed in this article to address this issue, just KB2918659.

Add-in cannot be installed

The assembly "Amazon.Scvmm.Addin" referenced to by add-in component "AWS Systems

Manager for

Microsoft SCVMM" could not be found in the add-in package. This could be due to the following

reasons:

1. The assembly was not included with the add-in package.
2. The AssemblyName attribute for the add-in does not match the name of the add-in assembly.
3. The assembly file is corrupt and cannot be loaded.

Installation errors

If you receive one of the following errors during installation, it is likely due to an issue with SCVMM:

Could not update managed code add-in pipeline due to the following error:

Access to the path 'C:\Program Files\Microsoft System Center 2012\Virtual Machine Manager

\Bin\AddInPipeline\PipelineSegments.store' is denied.

Could not update managed code add-in pipeline due to the following error:

The required folder 'C:\Program Files\Microsoft System Center 2012\Virtual Machine Manager

\Bin\AddInPipeline\HostSideAdapters' does not exist.

Add-in cannot be installed

The assembly "Microsoft.SystemCenter.VirtualMachineManager.UIAddIns.dll" referenced by the

add-in assembly "Amazon.Scvmm.AddIn" could not be found in the add-in package. Make sure

that this assembly was included with the add-in package.

Try one of the following steps to work around this issue:

- Grant authenticated users permission to read and run the C:\Program Files\Microsoft System Center 2012\Virtual Machine Manager\Bin\AddInPipeline folder. In Windows Explorer, right-click the folder, select **Properties**, and then select the **Security** tab.
- Close the SCVMM console and start it one time as an administrator. From the **Start** menu, locate SCVMM, right-click, and then select **Run as administrator**.

Check the log file

If you have a problem using the add-in, check the generated log file, %APPDATA%\Amazon\SCVMM\ec2addin.log, for useful information.

Errors importing a virtual machine

The log file, %APPDATA%\Amazon\SCVMM\ec2addin.log, contains detailed information about the status of an import task. The following are common errors that you might see in the log file when you import your VM from SCVMM to Amazon EC2.

Error: Unable to extract Hyper-V VirtualMachine object

Solution: Configure the path to the Hyper-V PowerShell module.

Error: You do not have permission to perform the operation

This error usually occurs when Hyper-V can't save the VM image into the configured path. To resolve this issue, do the following.

1. Create a directory on the Hyper-V server. For example: C:\vmimages.
2. Share the directory you just created in Hyper-V. Any user running SCVMM should be given access to the directory.
3. In the plugin, set the export path to \\hyperv\vmimages.
4. Perform the export.

The image will be exported to a local directory on the Hyper-V server. The SCVMM plugin will pull it from Hyper-V, and upload into Amazon S3.

Uninstall the add-in

If you need to uninstall the add-in, use the following procedure.

To uninstall the add-in

1. Open the VMM console.
2. Select the **Settings** workspace, and then click **Console Add-Ins**.
3. Select **AWS Systems Manager for Microsoft SCVMM**.

4. On the ribbon, click **Remove**.
5. When prompted for confirmation, click **Yes**.

If you reinstall the add-in after uninstalling it and receive the following error, delete the path as suggested by the error message.

Error (27301)

There was an error while installing the add-in. Please ensure that the following path does not exist and then try the installation again.

```
C:\Program Files\Microsoft System Center 2012\Virtual Machine Manager\Bin\AddInPipeline  
\  
AddIns\EC2WINDOWS...
```

Document history

The following table describes important additions to the Amazon EC2 documentation starting in 2019. We also update the documentation frequently to address the feedback that you send us.

Change	Description	Date
<u>New managed policy for VSS-enabled EBS snapshots</u>	Amazon EC2 VSS has a new IAM managed policy available that you can add to your instance profile role to ensure that your permissions stay up-to-date and follow best practices.	March 28, 2024
<u>Set IMDSv2 as the account default</u>	You can set all new EC2 instance launches in your account to use Instance Metadata Service Version 2 (IMDSv2) by default.	March 25, 2024
<u>Tag new AMIs and snapshots when copying</u>	When you copy an AMI, you can tag the new AMI and the new snapshots with the same tags, or you can tag them with different tags.	March 7, 2024
<u>Remove AWS Management Pack pages</u>	The AWS Management Pack was primarily used with Windows Server 2012 and prior. Those legacy OS platform versions are no longer supported. To manage and troubleshoot your fleet of servers running on AWS and on-premises, see AWS	February 12, 2024

Systems Manager Fleet Manager.

<u>EC2 Instance Connect support for CentOS, macOS, and RHEL</u>	You can now install EC2 Instance Connect on supported CentOS, macOS, and RHEL AMIs.	December 6, 2023
<u>Hibernation support for C7a, C7i, R7a, R7i, and R7iz</u>	Hibernate your newly-launched instances running on C7a, C7i, R7a, R7i, and R7iz instance types.	December 1, 2023
<u>Amazon Q EC2 instance type selector</u>	Amazon Q EC2 instance type selector considers your use case, workload type, and CPU manufacturer preference, as well as how you prioritize price and performance. It then uses this data to provide guidance and suggestions for Amazon EC2 instance types that are best suited for your new workloads.	November 28, 2023
<u>EC2 Free Tier</u>	You can track your Free Tier usage from the EC2 Dashboard.	November 26, 2023

<u>Console-to-Code</u>	Console-to-Code can help you get started with your automation code. Console-to-Code records your console actions, and then uses generative AI to suggest code in your preferred infrastructure-as code format. You can use the code as a starting point, customizing it to make it production-ready for your specific use case.	November 26, 2023
<u>AWSDataLifecycleManagerSSMFullAccess AWS managed policy</u>	Updated the policy to support application-consistent snapshots for SAP HANA using the AWSSystemManagerSAP-CreateDLMSnapshotForSAPHANA SSM document.	November 17, 2023
<u>VolumeStalledIOCheck metric</u>	You can use the VolumeStalledIOCheck metric to check whether a volume has passed or failed a stalled IO check in the last minute.	November 16, 2023
<u>PTP hardware clock</u>	Supported instances now have a Precision Time Protocol (PTP) hardware clock.	November 16, 2023
<u>Change instance type of instance enabled for hibernation</u>	You can now change the instance type of an instance enabled for hibernation when it is in the stopped state.	November 16, 2023

<u>Amazon Data Lifecycle Manager default policies</u>	You can now create Amazon Data Lifecycle Manager default policies for EBS snapshots and EBS-backed AMIs to backup all volumes and instances in a Region.	November 16, 2023
<u>AWS managed policy for Amazon Data Lifecycle Manager</u>	Added the AWS <code>DLMDefaultSnapshotPoliciesServiceRolePolicy</code> and <code>AWS_{DLMDefaultAMIPoliciesServiceRolePolicy}</code> AWS managed policies to support Amazon Data Lifecycle Manager default policies.	November 16, 2023
<u>Amazon EBS snapshot lock</u>	You can lock your Amazon EBS snapshots to protect them against accidental or malicious deletions, or to store them in WORM format for a specific duration.	November 15, 2023
<u>Amazon EBS performance updates</u>	Updated Amazon EBS performance for C6in, M6in, M6idn, R6in, and R6idn instances.	November 15, 2023
<u>Amazon EBS performance updates</u>	Updated Amazon EBS performance for C6in, M6in, M6idn, R6in, and R6idn instances.	November 15, 2023

<u>Instance topology</u>	You can use the <code>DescribeInstanceTopology</code> API to detect the location of your instances, and then use this information to optimize HPC and ML jobs by running them on instances that are physically closer to each other.	November 13, 2023
<u>Block public access for snapshots</u>	You can now use block public access for snapshots to prevent the public sharing of your snapshots.	November 9, 2023
<u>Amazon Data Lifecycle Manager pre and post scripts</u>	You can now use pre and post scripts in your Amazon Data Lifecycle Manager snapshot policies to automate the lifecycle of application-consistent snapshots.	November 7, 2023
<u>AWSDataLifecycleManagerSSMFullAccess AWS managed policy</u>	Amazon Data Lifecycle Manager added the <code>AWSDataLifecycleManagerSSMFullAccess</code> AWS managed policy.	November 7, 2023
<u>Windows fast launch shared AMI support</u>	You can now enable Windows fast launch on an AMI that's shared with you. When you enable Windows fast launch on a shared AMI, the pre-provisioned snapshots for faster launching are created in your account.	November 6, 2023

<u>Capacity Blocks for ML</u>	You can now reserve GPU instances on a future date to support your short duration machine learning (ML) workloads.	October 31, 2023
<u>New bare metal instances</u>	.metal-16x1 and .metal-32x1 bare metal instances for R7iz.	October 30, 2023
<u>New bare metal instances</u>	.metal-24x1 and .metal-48x1 bare metal instances for M7i, R7i, and C7i.	October 30, 2023
<u>New I4i instances</u>	i4i.12xlarge and i4i.24xlarge instances are now available.	October 26, 2023
<u>Spot Instance hibernation</u>	You can now hibernate your Spot Instances using the same hibernation experience and instance families that are currently available for On-Demand Instances.	October 24, 2023
<u>Default settings for block public access for AMIs</u>	Block public access for AMIs is now enabled by default for all new accounts and for existing accounts with no public AMIs.	October 20, 2023
<u>Amazon EC2 Global View</u>	Amazon EC2 Global View supports additional resource types and customizable display options.	October 18, 2023

<u>R7i instances</u>	New memory optimized instance types that feature 4th generation Intel Xeon Scalable processors.	October 16, 2023
<u>Disable an AMI</u>	You can disable an AMI to prevent it from being used for instance launches.	October 12, 2023
<u>Attached EBS status checks</u>	You can use the attached EBS status checks to monitor if the Amazon EBS volumes attached to an instance are reachable.	October 11, 2023
<u>New bare metal instance</u>	r7a.metal-48x1 bare metal instance for R7a. Bare metal instances provide your applications with direct access to the physical resources of the host server.	October 4, 2023
<u>C7a instances</u>	New compute optimized instances powered by 4th generation AMD EPYC processors.	October 4, 2023
<u>Hibernation support for Microsoft Windows Server 2022</u>	Hibernate your newly-launched instances that were launched from the Microsoft Windows Server 2022 AMI.	October 2, 2023

<u>Initiate interruption of Spot Instances in a Spot Fleet</u>	You can select a Spot Fleet in the Amazon EC2 console and initiate an interruption of Spot Instances in the fleet so that you can test how the applications on your Spot Instances handle being interrupted.	September 21, 2023
<u>NVMe reservations</u>	Multi-Attach enabled io2 volumes support NVMe reservations, which is a set of industry-standard storage fencing protocols.	September 18, 2023
<u>C7i instances</u>	New compute optimized instance types that feature 4th generation Intel Xeon Scalable processors.	September 14, 2023
<u>Block public access to AMIs</u>	You can enable <i>block public access for AMIs</i> at the account level to block any attempts to make your AMIs public.	September 12, 2023
<u>R7a instances</u>	New memory optimized instance types featuring 4th generation AMD EPYC 9R14 processors and up to 1536 GiB of system memory.	September 11, 2023
<u>R7iz instances</u>	New high-frequency and high memory instances powered by 4th generation Intel Xeon processors.	September 7, 2023

<u>Hibernation support for M7i and M7i-flex</u>	Hibernate your newly-launched instances running on M7i and M7i-flex instance types.	August 22, 2023
<u>Hpc7a instances</u>	New compute optimized instance types that feature 4th generation AMD EPYC processors. These instance types support up to 300 Gbps networking bandwidth, and up to 192 CPU cores with up to 768 GB of system memory.	August 17, 2023
<u>M7a instances</u>	New general purpose instances powered by 4th generation AMD EPYC processors.	August 15, 2023
<u>EC2-Classic has been deprecated</u>	With EC2-Classic, EC2 instances ran in a single, flat network shared with other customers. Amazon VPC replaces EC2-Classic. With Amazon VPC, your instances run in a virtual private cloud (VPC) that's logically isolated to your AWS account.	August 8, 2023

<u>M7i-flex instances</u>	New general purpose instances that offer a balance of compute, memory, and network resources for a broad spectrum of general purpose applications. They deliver a baseline CPU performance of 40 percent with the ability to deliver up to 100 percent CPU performance for 95 percent of the time over a 24-hour period.	August 2, 2023
<u>M7i instances</u>	New general purpose instance types that feature 4th generation Intel Xeon Scalable processors.	August 2, 2023
<u>Amazon EBS performance updates</u>	Updated Amazon EBS performance for R6a instances.	June 29, 2023
<u>Dedicated Hosts</u>	You can allocate Dedicated Hosts on specific hardware assets on an Outpost.	June 20, 2023
<u>EC2 Instance Connect Endpoint</u>	You can now connect to an instance via SSH or RDP without requiring the instance to have a public IPv4 address.	June 13, 2023
<u>IMDS Package Analyzer</u>	You can now use the IMDS Packet Analyzer to identify sources of IMDSv1 calls on your EC2 instances.	June 1, 2023

<u>Launch template quotas</u>	You can now view your quotas for launch templates and launch template versions in the Service Quotas console and by using the Service Quotas CLI.	April 3, 2023
<u>Capacity Reservation utilization notifications</u>	AWS Health now sends notifications when capacity utilization for Capacity Reservations in your account drops below 20 percent.	April 3, 2023
<u>Amazon EBS performance updates</u>	Updated Amazon EBS performance for M6a and C6a instances.	April 3, 2023
<u>Capacity Reservation groups</u>	You can now add Capacity Reservations that are shared with you to Capacity Reservation groups that you own.	March 30, 2023
<u>New bare metal instances</u>	Bare metal instances for C6in, M6idn, M6in, R6idn, and R6in.	March 21, 2023
<u>Modify instance metadata options</u>	You can now use the Amazon EC2 console to modify instance metadata options.	March 20, 2023
<u>UEFI preferred</u>	You can now create a single AMI that supports both Unified Extensible Firmware Interface (UEFI) and Legacy BIOS boot modes.	March 3, 2023

<u>Modify an AMI for IMDSv2</u>	Modify your existing AMI so that instances launched from the AMI require IMDSv2 by default.	February 28, 2023
<u>Add supported instances for ENA Express</u>	Added a table with new and existing supported instance types for ENA Express.	February 13, 2023
<u>Windows Virtualization-based security - Credential Guard</u>	You can enable Credential Guard, a Virtualization-based security (VBS) feature, on supported Amazon EC2 instances.	January 31, 2023
<u>Fault testing on Amazon EBS</u>	Use AWS FIS to temporarily stop I/O between an EBS volume and the instances to which it is attached to test how your workloads handle I/O interruptions.	January 27, 2023
<u>AMI alias in launch templates</u>	You can specify an AWS Systems Manager parameter instead of the AMI ID in your launch templates to avoid having to update the templates every time the AMI ID changes.	January 19, 2023
<u>Hibernation support for C6i, I3en, and M6i</u>	Hibernate your newly-launched instances running on C6i, I3en, and M6i instance types.	December 19, 2022

<u>Torn write prevention</u>	Improve the performance of your I/O-intensive relational database workloads and reduce latency without negatively impacting data resiliency with torn write prevention, a block storage feature.	November 29, 2022
<u>Hpc6id instance</u>	New memory optimized instance featuring 3rd generation Intel Xeon Scalable processors (Ice Lake).	November 29, 2022
<u>R6in and R6idn instances</u>	New memory optimized instances for network-intensive workloads.	November 28, 2022
<u>M6in and M6idn instances</u>	New general computing instances types.	November 28, 2022
<u>ENAv Express</u>	Increase throughput and minimize tail latency of network traffic between EC2 instances with ENA Express.	November 28, 2022
<u>C6in instances</u>	New compute optimized instances ideal for running high performance computing.	November 28, 2022
<u>Recycle Bin retention rule lock</u>	You can lock retention rules to help protect them against accidental or malicious modifications and deletions.	November 23, 2022
<u>Copy AMI tags</u>	When you copy an AMI, you can copy your user-defined AMI tags at the same time.	November 18, 2022

<u>AMI size for store and restore</u>	The size of an AMI (before compression) that can be stored and restored to and from an Amazon S3 bucket can now be up to 5,000 GB.	November 16, 2022
<u>priceCapacityOptimized allocation strategy for Spot Instances</u>	A Spot Fleet that uses the priceCapacityOptimized allocation strategy looks at both price and capacity to select the Spot Instances pools that are the least likely to be interrupted and have the lowest possible price.	November 10, 2022
<u>price-capacity-optimized allocation strategy for Spot Instances</u>	An EC2 Fleet that uses the price-capacity-optimized allocation strategy looks at both price and capacity to select the Spot Instances pools that are the least likely to be interrupted and have the lowest possible price.	November 10, 2022
<u>Cancel having an AMI shared with your account</u>	If an AMI has been shared with your AWS account and you no longer want it shared with your account, you can remove your account from the AMI's launch permissions.	November 4, 2022
<u>Transfer Elastic IP addresses</u>	You can now transfer Elastic IP addresses from one AWS account to another.	October 31, 2022

<u>Replace root volume</u>	You can replace the root Amazon EBS volume for a running instance using an AMI.	October 27, 2022
<u>Trn1 instances</u>	New accelerated computing instances optimized for deep learning powered by AWS Trainium chips.	October 10, 2022
<u>Automatically connect instance to database</u>	Use the automatic connection feature to quickly connect one or more EC2 instances to an RDS database to allow traffic between them.	October 10, 2022
<u>AMI quotas</u>	Quotas now apply to creating and sharing AMIs.	October 10, 2022
<u>Configure AMI for IMDSv2</u>	Configure your AMI so that instances launched from the AMI require IMDSv2 by default.	October 3, 2022
<u>Initiate Spot Instance interruption</u>	You can select a Spot Instance in the Amazon EC2 console and initiate an interruption so that you can test how the applications on your Spot Instances handle being interrupted.	September 26, 2022
<u>Verified AMI provider</u>	In the Amazon EC2 console, public AMIs that are owned by Amazon or a verified Amazon partner are marked Verified provider .	July 22, 2022

<u>R6a instances</u>	New memory optimized instances featuring 3rd generation AMD EPYC processors.	July 19, 2022
<u>Placement groups on AWS Outposts</u>	Added a host spread strategy for placement groups on an Outpost.	June 30, 2022
<u>Condition keys for Recycle Bin</u>	You can use the <code>rbin:Request/ResourceType</code> and <code>rbin:Attribute/ResourceType</code> condition keys to filter access on Recycle Bin requests.	June 14, 2022
<u>R6id instances</u>	New memory optimized instances featuring 3rd generation Intel Xeon Scalable processors (Ice Lake).	June 9, 2022
<u>io2 Block Express volumes</u>	You can modify the size and provisioned IOPS of io2 Block Express volumes and you can enable them for fast snapshot restore.	May 31, 2022
<u>Dedicated Hosts on AWS Outposts</u>	You can allocate Dedicated Hosts on AWS Outposts.	May 31, 2022
<u>M6id instances</u>	New general purpose instances featuring 3rd generation Intel Xeon Scalable processors (Ice Lake).	May 26, 2022

<u>C6id instances</u>	New compute optimized instances featuring 3rd generation Intel Xeon Scalable processors (Ice Lake).	May 26, 2022
<u>Instance stop protection</u>	To prevent your instance from being accidentally stopped, you can enable stop protection for the instance.	May 24, 2022
<u>C7g instances</u>	New compute optimized instances featuring the latest AWS Graviton3 processors.	May 23, 2022
<u>UEFI Secure Boot</u>	UEFI Secure Boot builds on the long-standing secure boot process of Amazon EC2 and provides additional defense-in-depth that helps customers secure software from threats that persist across reboots.	May 10, 2022
<u>NitroTPM</u>	Nitro Trusted Platform Module (NitroTPM) is a virtual device that is provided by the AWS Nitro System and conforms to the TPM 2.0 specification.	May 10, 2022
<u>AMI state change events</u>	Amazon EC2 now generates an event when an AMI changes state. You can use Amazon EventBridge to detect and react to these events.	May 9, 2022

<u>Describe public keys</u>	You can query the public key and creation date of an Amazon EC2 key pair.	April 28, 2022
<u>Create key pairs</u>	You can specify the key format (PEM or PPK) when creating a new key pair.	April 28, 2022
<u>I4i instances</u>	New storage optimized instances featuring 3rd generation Intel Xeon Scalable processors (Ice Lake).	April 27, 2022
<u>Mount Amazon FSx file systems at launch</u>	You can mount a new or existing Amazon FSx for NetApp ONTAP or Amazon FSx for OpenZFS file system at launch using the new launch instance wizard.	April 12, 2022
<u>New launch instance wizard</u>	A new and improved launch experience in the Amazon EC2 console, providing a quicker and easier way to launch an EC2 instance.	April 5, 2022
<u>Automatically deprecate public AMIs</u>	By default, the deprecation date of all public AMIs is set to two years from the AMI creation date.	March 31, 2022
<u>Instance metadata category: autoscaling/target-lifecycle-state</u>	When using Auto Scaling groups, you can access an instance's target lifecycle state from the instance metadata.	March 24, 2022

<u>X2idn and X2iedn instances</u>	New memory optimized instances featuring Intel Xeon Scalable processors (Ice Lake).	March 10, 2022
<u>AMI last launched time</u>	The <code>lastLaunchedTime</code> indicates when your AMI was last used to launch an instance.	February 28, 2022
<u>C6a instances</u>	New compute optimized instances featuring 3rd generation AMD EPYC processors (Milan).	February 14, 2022
<u>Recycle Bin for AMIs</u>	Recycle Bin enables you to restore accidentally deleted AMIs.	February 3, 2022
<u>X2iezn instances</u>	New memory optimized instances featuring Intel Xeon Platinum processors (Cascade Lake).	January 26, 2022
<u>New Local Zones added</u>	Add Local Zones in Atlanta, Phoenix, and Seattle.	January 11, 2022
<u>Configure Windows AMIs for faster launching</u>	Configure Windows AMIs to launch instances up to 65% faster, using pre-provisioned snapshots.	January 10, 2022
<u>Instance tags in instance metadata</u>	You can access an instance's tags from the instance metadata.	January 6, 2022
<u>Capacity Reservations in cluster placement groups</u>	You can create Capacity Reservations in cluster placement groups.	January 6, 2022

<u>Recycle Bin for Amazon EBS snapshots</u>	Recycle Bin for Amazon EBS snapshots is a snapshot recovery feature that enables you to restore accidentally deleted snapshots.	November 29, 2021
<u>M6a instances</u>	New general purpose instances powered by AMD 3rd Generation EPYC processors.	November 29, 2021
<u>Amazon EBS Snapshots Archive</u>	Amazon EBS Snapshots Archive is a new storage tier that you can use for low-cost, long-term storage of your rarely-accessed snapshots.	November 29, 2021
<u>R6i instances</u>	New memory optimized instances.	November 22, 2021
<u>G5 instances</u>	New accelerated computing instances featuring up to 8 NVIDIA A10G GPUs and second generation AMD EPY processors.	November 11, 2021
<u>Spot Fleet launch-before-terminate</u>	Spot Fleet can terminate the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched.	November 4, 2021
<u>EC2 Fleet launch-before-terminate</u>	EC2 Fleet can terminate the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched.	November 4, 2021

<u>Share AMIs with organizations and OUs</u>	You can now share AMIs with the following AWS resources : organizations and organizational units (OUs).	October 29, 2021
<u>C6i instances</u>	New compute optimized instances featuring Intel Xeon Scalable processors (Ice Lake).	October 28, 2021
<u>Spot placement score</u>	Get a recommendation for an AWS Region or Availability Zone based on your Spot capacity requirements.	October 27, 2021
<u>Attribute-based instance type selection for Spot Fleet</u>	Specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes.	October 27, 2021
<u>Attribute-based instance type selection for EC2 Fleet</u>	Specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes.	October 27, 2021
<u>New Local Zones added</u>	Add Local Zones in Las Vegas, New York City, and Portland.	October 26, 2021
<u>On-Demand Capacity Reservation Fleet</u>	You can use a Capacity Reservation Fleet to launch a group, or fleet, of Capacity Reservations.	October 5, 2021
<u>Hibernation support for Ubuntu 20.04 LTS - Focal</u>	Hibernate your newly-launched instances that were launched from the Ubuntu 20.04 LTS - Focal AMI.	October 4, 2021

<u>EC2 Fleet and targeted On-Demand Capacity Reservations</u>	EC2 Fleet can launch On-Demand Instances into targeted Capacity Reservations.	September 22, 2021
<u>T3 instances on Dedicated Hosts</u>	Support for T3 instances on Amazon EC2 Dedicated Host.	September 14, 2021
<u>Hibernation support for RHEL, Fedora, and CentOS</u>	Hibernate your newly-launched instances that were launched from RHEL, Fedora, and CentOS AMIs.	September 9, 2021
<u>New Local Zones added</u>	Add Local Zones in Chicago, Minneapolis, and Kansas City.	September 8, 2021
<u>Amazon EC2 Global View</u>	Amazon EC2 Global View enables you to view VPCs, subnets, instances, security groups, and volumes across multiple AWS Regions in a single console.	September 1, 2021
<u>AMI deprecation support for Amazon Data Lifecycle Manager</u>	Amazon Data Lifecycle Manager EBS-backed AMI policies can deprecate AMIs. The AWSDataLifecycleManagerServiceRoleForAMIManagement AWS managed policy has been updated to support this feature.	August 23, 2021
<u>Hibernation support for C5d, M5d, and R5d</u>	Hibernate your newly-launched instances running on C5d, M5d, and R5d instance types.	August 19, 2021

<u>Amazon EC2 key pairs</u>	Amazon EC2 now supports ED25519 keys on Linux and Mac instances.	August 17, 2021
<u>M6i instances</u>	New general purpose instances featuring third generation Intel Xeon Scalable processors (Ice Lake).	August 16, 2021
<u>CloudWatch metrics for Amazon Data Lifecycle Manager</u>	You can monitor your Amazon Data Lifecycle Manager policies using Amazon CloudWatch.	July 28, 2021
<u>New Local Zone added</u>	Add Local Zone in Denver.	July 27, 2021
<u>CloudTrail data events for EBS direct APIs</u>	The ListSnapshotBlocks, ListChangedBlocks, GetSnapshotBlock, and PutSnapshotBlock APIs can be logged data events in CloudTrail.	July 27, 2021
<u>Prefixes for network interface s</u>	You can assign a private IPv4 or IPv6 CIDR range, either automatically or manually, to your network interfaces.	July 22, 2021
<u>io2 Block Express volumes</u>	io2 Block Express volumes are now generally available in all Regions and Availability Zones that support R5b instances.	July 19, 2021

<u>Event windows</u>	You can define custom, weekly-recurring event windows for scheduled events that reboot, stop, or terminate your Amazon EC2 instances.	July 15, 2021
<u>Resource IDs and tagging support for security group rules</u>	You can refer to security group rules by resource ID. You can also add tags to your security group rules.	July 7, 2021
<u>New Local Zones added</u>	Add Local Zones in Dallas and Philadelphia.	July 7, 2021
<u>Deprecate an AMI</u>	You can now specify when an AMI is deprecated.	June 11, 2021
<u>Windows per-second billing</u>	Amazon EC2 charges for Windows- and SQL Server-based usage by the second, with a one-minute minimum charge.	June 10, 2021
<u>Capacity Reservations on AWS Outposts</u>	You can now use Capacity Reservations on AWS Outposts.	May 24, 2021
<u>Capacity Reservation sharing</u>	You can now share Capacity Reservations created in Local Zones and Wavelength Zones.	May 24, 2021

<u>High memory virtualized instances</u>	Virtualized high memory instances purpose-built to run large in-memory databases. The new types are u-6tb1.56xlarge, u-6tb1.112xlarge, u-9tb1.112xlarge, and u-12tb1.112xlarge.	May 11, 2021
<u>Root volume replacement</u>	You can now use root volume replacement tasks to replace the root EBS volume for running instances.	April 22, 2021
<u>Store and restore an AMI using S3</u>	Store EBS-backed AMIs in S3 and restore them from S3 to enable cross-partition copying of AMIs.	April 6, 2021
<u>EC2 Serial Console</u>	Troubleshoot boot and network connectivity issues by establishing a connection to the serial port of an instance.	March 30, 2021
<u>Boot modes</u>	Amazon EC2 now supports UEFI boot on selected AMD- and Intel-based EC2 instances.	March 22, 2021
<u>Amazon EBS local snapshots on Outposts</u>	You can now use Amazon EBS local snapshots on Outposts to store snapshots of volumes on an Outpost locally in Amazon S3 on the Outpost itself.	February 4, 2021

<u>Create a reverse DNS record</u>	You can now set up reverse DNS lookup for your Elastic IP addresses.	February 3, 2021
<u>Amazon Data Lifecycle Manager</u>	Use Amazon Data Lifecycle Manager to automate the process of sharing snapshots and copying them across AWS accounts.	December 17, 2020
<u>G4ad instances</u>	New instances powered by AMD Radeon Pro V520 GPUs and AMD 2nd Generation EPYC processors.	December 9, 2020
<u>Tag AMIs and snapshots on AMI creation</u>	When you create an AMI, you can tag the AMI and the snapshots with the same tags, or you can tag them with different tags.	December 4, 2020
<u>io2 Block Express preview</u>	You can opt in to the io2 Block Express volumes preview. io2 Block Express volumes provide sub-millisecond latency, and support higher IOPS, higher throughput, and larger capacity than io2 volumes.	December 1, 2020
<u>gp3 volumes</u>	A new Amazon EBS General Purpose SSD volume type. You can specify provisioned IOPS and throughput when you create or modify the volume.	December 1, 2020

<u>D3, D3en, M5zn, and R5b instances</u>	New instance types built on the Nitro System.	December 1, 2020
<u>Throughput Optimized HDD and Cold HDD volume sizes</u>	Throughput Optimized HDD (st1) and Cold HDD (sc1) volumes can range in size from 125 GiB to 16 TiB.	November 30, 2020
<u>Use Amazon EventBridge to monitor Spot Fleet events</u>	Create EventBridge rules that trigger programmatic actions in response to Spot Fleet state changes and errors.	November 20, 2020
<u>Use Amazon EventBridge to monitor EC2 Fleet events</u>	Create EventBridge rules that trigger programmatic actions in response to EC2 Fleet state changes and errors.	November 20, 2020
<u>Delete instant fleets</u>	Delete an EC2 Fleet of type instant and terminate all the instances in the fleet in a single API call.	November 18, 2020
<u>Hibernation support for T3 and T3a</u>	Hibernate your newly-launched instances running on T3 and T3a instance types.	November 17, 2020
<u>Amazon Data Lifecycle Manager</u>	You can use Amazon Data Lifecycle Manager to automate the creation, retention, and deletion of EBS-backed AMIs.	November 9, 2020
<u>Instance metadata category: events/recommendations/rebalance</u>	The approximate time, in UTC, when the EC2 instance rebalance recommendation notification is emitted for the instance.	November 4, 2020

<u>EC2 instance rebalance recommendation</u>	A signal that notifies you when a Spot Instance is at elevated risk of interruption.	November 4, 2020
<u>Capacity Reservations in Wavelength Zones</u>	Capacity Reservations can now be created and used in Wavelength Zones.	November 4, 2020
<u>Capacity Rebalancing</u>	Configure Spot Fleet or EC2 Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation.	November 4, 2020
<u>Hibernation support for I3, M5ad, and R5ad</u>	Hibernate your newly-launched instances running on I3, M5ad, and R5ad instance types.	October 21, 2020
<u>Spot Instance vCPU limits</u>	Spot Instance limits are now managed in terms of the number of vCPUs that your running Spot Instances are either using or will use pending the fulfillment of open requests.	October 1, 2020
<u>Capacity Reservations in Local Zones</u>	Capacity Reservations can now be created and used in Local Zones.	September 30, 2020
<u>Amazon Data Lifecycle Manager</u>	Amazon Data Lifecycle Manager policies can be configured with up to four schedules.	September 17, 2020

<u>Hibernation support for M5a and R5a</u>	Hibernate your newly-launched instances running on M5a and R5a instance types.	August 28, 2020
<u>Provisioned IOPS SSD (io2) volumes for Amazon EBS</u>	Provisioned IOPS SSD (io2) volumes are designed to provide 99.999 percent volume durability with an AFR no higher than 0.001 percent.	August 24, 2020
<u>Instance metadata provides instance location and placement information</u>	New instance metadata fields under the placement category: Region, placement group name, partition number, host ID, and Availability Zone ID.	August 24, 2020
<u>C5ad instances</u>	New compute optimized instances featuring second-generation AMD EPYC processors.	August 13, 2020
<u>Wavelength Zones</u>	A Wavelength Zone is an isolated zone in the carrier location where the Wavelength infrastructure is deployed.	August 6, 2020
<u>Capacity Reservation groups</u>	You can use AWS Resource Groups to create logical collections of Capacity Reservations, and then target instance launches into those groups.	July 29, 2020
<u>Fast snapshot restore</u>	You can enable fast snapshot restore for snapshots that are shared with you.	July 21, 2020

<u>EC2Launch v2</u>	You can use EC2Launch v2 to perform tasks during instance startup, if an instance is stopped and later started, if an instance is restarted, and on demand. EC2Launch v2 supports all versions of Windows Server and replaces EC2Launch and EC2Config.	June 30, 2020
<u>Bare metal instances for G4dn</u>	New instances that provide your applications with direct access to the physical resources of the host server.	June 5, 2020
<u>C5a instances</u>	New compute optimized instances featuring second-generation AMD EPYC processors.	June 4, 2020
<u>Bring your own IPv6 addresses</u>	You can bring part or all of your IPv6 address range from your on-premises network to your AWS account.	May 21, 2020
<u>Launch instances using a Systems Manager parameter</u>	You can specify a AWS Systems Manager parameter instead of an AMI when you launch an instance.	May 5, 2020
<u>Customize scheduled event notifications</u>	You can customize scheduled event notifications to include tags in the email notification.	May 4, 2020

<u>Windows Server on Dedicated Hosts</u>	You can use Windows Server AMIs provided by Amazon to run the latest versions of Windows Server on Dedicated Hosts.	April 7, 2020
<u>Stop and start a Spot Instance</u>	Stop your Spot Instances backed by Amazon EBS and start them at will, instead of relying on the stop interrupt behavior.	January 13, 2020
<u>Resource tagging</u>	You can tag egress-only internet gateways, local gateways, local gateway route tables, local gateway virtual interfaces, local gateway virtual interface groups, local gateway route table VPC associations, and local gateway route table virtual interface group associations.	January 10, 2020
<u>Connect to your instance using Session Manager</u>	You can start a Session Manager session with an instance from the Amazon EC2 console.	December 18, 2019
<u>Dedicated Hosts and host resource groups</u>	Dedicated Hosts can now be used with host resource groups.	December 2, 2019
<u>Dedicated Host sharing</u>	You can now share your Dedicated Hosts across AWS accounts.	December 2, 2019

<u>Default credit specification at the account level</u>	You can set the default credit specification per burstable performance instance family at the account level per AWS Region.	November 25, 2019
<u>Instance type discovery</u>	You can find an instance type that meets your needs.	November 22, 2019
<u>Dedicated Hosts</u>	You can now configure a Dedicated Host to support multiple instance types in an instance family.	November 21, 2019
<u>Amazon EBS fast snapshot restores</u>	You can enable fast snapshot restores on an EBS snapshot to ensure that EBS volumes created from the snapshot are fully-initialized at creation and instantly deliver all of their provisioned performance.	November 20, 2019
<u>Instance Metadata Service Version 2</u>	You can use Instance Metadata Service Version 2, which is a session-oriented method for requesting instance metadata.	November 19, 2019
<u>Hibernation support for On-Demand Windows instances</u>	You can hibernate On-Demand Windows instances.	October 14, 2019
<u>Queued purchases of Reserved Instances</u>	You can queue the purchase of a Reserved Instance up to three years in advance.	October 4, 2019
<u>G4dn instances</u>	New instances featuring NVIDIA Tesla GPUs.	September 19, 2019

<u>Diagnostic interrupt</u>	You can send a diagnostic interrupt to an unreachable or unresponsive instance to trigger a blue screen/stop error.	August 14, 2019
<u>Capacity optimized allocation strategy</u>	Using EC2 Fleet or Spot Fleet, you can launch Spot Instances from Spot pools with optimal capacity for the number of instances that are launching.	August 12, 2019
<u>On-Demand Capacity Reservation sharing</u>	You can now share your Capacity Reservations across AWS accounts.	July 29, 2019
<u>Resource tagging</u>	Launch templates on creation.	July 24, 2019
<u>Host recovery</u>	Automatically restart your instances on a new host in the event of an unexpected hardware failure on a Dedicated Host.	June 5, 2019
<u>Amazon EBS multi-volume snapshots</u>	You can take exact point-in-time, data coordinated, and crash-consistent snapshots across multiple EBS volumes attached to an EC2 instance.	May 29, 2019
<u>Resource tagging</u>	You can tag Dedicated Host Reservations.	May 27, 2019

<u>Amazon EBS encryption by default</u>	After you enable encryption by default in a Region, all new EBS volumes you create in the Region are encrypted using the default KMS key for EBS encryption.	May 23, 2019
<u>VSS application-consistent snapshots</u>	Take application-consistent snapshots of all Amazon EBS volumes attached to your Windows instances using AWS Systems Manager Run Command.	May 13, 2019
<u>Resource tagging</u>	You can tag VPC endpoints, endpoint services, and endpoint service configurations.	May 13, 2019
<u>Windows to Linux Replatforming Assistant for Microsoft SQL Server Databases</u>	Move existing Microsoft SQL Server workloads from a Windows to a Linux operating system.	May 8, 2019
<u>I3en instances</u>	New I3en instances can utilize up to 100 Gbps of network bandwidth.	May 8, 2019
<u>Windows Automated Upgrade</u>	Perform automated upgrades of EC2 Windows instances using AWS Systems Manager.	May 6, 2019
<u>T3a instances</u>	New instances featuring AMD EPYC processors.	April 24, 2019
<u>M5ad and R5ad instances</u>	New instances featuring AMD EPYC processors.	March 27, 2019

Resource tagging	You can assign custom tags to your Dedicated Host Reservations to categorize them in different ways.	March 14, 2019
Bare metal instances for M5, M5d, R5, R5d, and z1d	New instances that provide your applications with direct access to the physical resources of the host server.	February 13, 2019

History for previous years

The following table describes important additions to the Amazon EC2 documentation in 2018 and earlier years.

Feature	API version	Description	Release date
Partition placement groups	2016-11-15	Partition placement groups spread instances across logical partitions, ensuring that instances in one partition do not share underlying hardware with instances in other partitions. For more information, see Partition placement groups .	20 December 2018
p3dn.24xlarge instances	2016-11-15	New p3dn.24xlarge instances provide 100 Gbps of network bandwidth.	7 December 2018
Instances featuring 100 Gbps of network bandwidth	2016-11-15	New C5n instances can utilize up to 100 Gbps of network bandwidth.	26 November 2018
Spot console recommends a fleet of instances	2016-11-15	The Spot console recommends a fleet of instances based on Spot best practice (instance diversification) to meet the minimum hardware specifications (vCPUs, memory, and	20 November 2018

Feature	API version	Description	Release date
		storage) for your application need. For more information, see Create a Spot Fleet request .	
New EC2 Fleet request type: instant	2016-11-1 5	EC2 Fleet now supports a new request type, instant, that you can use to synchronously provision capacity across instance types and purchase models. The instant request returns the launched instances in the API response, and takes no further action, enabling you to control if and when instances are launched. For more information, see EC2 Fleet request types .	14 November 2018
Instances featuring AMD EPYC processors	2016-11-1 5	New general purpose (M5a) and memory optimized instances (R5a) offer lower-priced options for microservices, small to medium databases, virtual desktops, development and test environments, business applications, and more.	6 November 2018
Spot savings information	2016-11-1 5	You can view the savings made from using Spot Instances for a single Spot Fleet or for all Spot Instances. For more information, see Savings from purchasing Spot Instances .	5 November 2018
Console support for optimizing CPU options	2016-11-1 5	When you launch an instance, you can optimize the CPU options to suit specific workloads or business needs using the Amazon EC2 console. For more information, see Optimize CPU options .	31 October 2018

Feature	API version	Description	Release date
Console support for creating a launch template from an instance	2016-11-15	<p>You can create a launch template using an instance as the basis for a new launch template using the Amazon EC2 console.</p> <p>For more information, see Create a launch template.</p>	30 October 2018
On-Demand Capacity Reservations	2016-11-15	<p>You can reserve capacity for your Amazon EC2 instances in a specific Availability Zone for any duration. This allows you to create and manage capacity reservations independently from the billing discounts offered by Reserved Instances (RI). For more information, see On-Demand Capacity Reservations.</p>	25 October 2018
Bring Your Own IP Addresses (BYOIP)	2016-11-15	<p>You can bring part or all of your public IPv4 address range from your on-premises network to your AWS account. After you bring the address range to AWS, it appears in your account as an address pool. You can create an Elastic IP address from your address pool and use it with your AWS resources. For more information, see Bring your own IP addresses (BYOIP) in Amazon EC2.</p>	23 October 2018
g3s.xlarge instances	2016-11-15	<p>Expands the range of the accelerated-computing G3 instance family with the introduction of g3s.xlarge instances.</p>	11 October 2018
Dedicated Host tag on create and console support	2016-11-15	<p>You can tag your Dedicated Hosts on creation, and you can manage your Dedicated Host tags using the Amazon EC2 console. For more information, see Allocate Dedicated Hosts.</p>	08 October 2018

Feature	API version	Description	Release date
High memory instances	2016-11-15	These instances are purpose-built to run large in-memory databases. They offer bare metal performance with direct access to host hardware.	27 September 2018
f1.4xlarge instances	2016-11-15	Expands the range of the accelerated-computing F1 instance family with the introduction of f1.4xlarge instances.	25 September 2018
Console support for scheduled scaling for Spot Fleet	2016-11-15	Increase or decrease the current capacity of the fleet based on the date and time. For more information, see Scale Spot Fleet using scheduled scaling .	20 September 2018
T3 instances	2016-11-15	T3 instances are burstable general-purpose instance type that provide a baseline level of CPU performance with the ability to burst CPU usage at any time for as long as required. For more information, see Burstable performance instances .	21 August 2018
Allocation strategies for EC2 Fleets	2016-11-15	You can specify whether On-Demand capacity is fulfilled by price (lowest price first) or priority (highest priority first). You can specify the number of Spot pools across which to allocate your target Spot capacity. For more information, see Allocation strategies for Spot Instances .	26 July 2018

Feature	API version	Description	Release date
Allocation strategies for Spot Fleets	2016-11-15	You can specify whether On-Demand capacity is fulfilled by price (lowest price first) or priority (highest priority first). You can specify the number of Spot pools across which to allocate your target Spot capacity. For more information, see Allocation strategies for Spot Instances .	26 July 2018
R5 and R5d instances	2016-11-15	R5 and R5d instances are ideally suited for high-performance databases, distributed in-memory caches, and in-memory analytics. R5d instances come with NVMe instance store volumes.	25 July 2018
z1d instances	2016-11-15	These instances are designed for applications that require high per-core performance with a large amount of memory, such as electronic design automation (EDA) and relational databases. These instances come with NVME instance store volumes.	25 July 2018
Automate snapshot lifecycle	2016-11-15	You can use Amazon Data Lifecycle Manager to automate creation and deletion of snapshots for your EBS volumes. For more information, see Amazon Data Lifecycle Manager .	12 July 2018
Launch template CPU options	2016-11-15	When you create a launch template using the command line tools, you can optimize the CPU options to suit specific workloads or business needs. For more information, see Create a launch template .	11 July 2018
Tag Dedicated Hosts	2016-11-15	You can tag your Dedicated Hosts. For more information, see Tag Dedicated Hosts .	3 July 2018

Feature	API version	Description	Release date
i3.metal instances	2016-11-15	i3.metal instances provide your applications with direct access to the physical resources of the host server, such as processors and memory.	17 May 2018
Get latest console output	2016-11-15	You can retrieve the latest console output for some instance types when you use the get-console-output AWS CLI command.	9 May 2018
Optimize CPU options	2016-11-15	When you launch an instance, you can optimize the CPU options to suit specific workloads or business needs. For more information, see Optimize CPU options .	8 May 2018
EC2 Fleet	2016-11-15	You can use EC2 Fleet to launch a group of instances across different EC2 instance types and Availability Zones, and across On-Demand Instance, Reserved Instance, and Spot Instance purchasing models. For more information, see EC2 Fleet .	2 May 2018
On-Demand Instances in Spot Fleets	2016-11-15	You can include a request for On-Demand capacity in your Spot Fleet request to ensure that you always have instance capacity. For more information, see Spot Fleet .	2 May 2018
Tag EBS snapshots on creation	2016-11-15	You can apply tags to snapshots during creation.	2 April 2018
Change placement groups	2016-11-15	You can move an instance in or out of a placement group, or change its placement group. For more information, see Change the placement group for an instance .	1 March 2018

Feature	API version	Description	Release date
Longer resource IDs	2016-11-15	You can enable the longer ID format for more resource types. For more information, see Resource IDs .	9 February 2018
Network performance improvements	2016-11-15	Instances outside of a cluster placement group can now benefit from increased bandwidth when sending or receiving network traffic between other instances or Amazon S3.	24 January 2018
Tag Elastic IP addresses	2016-11-15	You can tag your Elastic IP addresses. For more information, see Tag an Elastic IP address .	21 December 2017
Amazon Time Sync Service	2016-11-15	You can use the Amazon Time Sync Service to keep accurate time on your instance. For more information, see Set the time for your Windows instance .	29 November 2017
T2 Unlimited	2016-11-15	T2 Unlimited instances can burst above the baseline for as long as required. For more information, see Burstable performance instances .	29 November 2017
Launch templates	2016-11-15	A launch template can contain all or some of the parameters to launch an instance, so that you don't have to specify them every time you launch an instance. For more information, see Launch an instance from a launch template .	29 November 2017
Spread placement	2016-11-15	Spread placement groups are recommended for applications that have a small number of critical instances that should be kept separate from each other. For more information, see Spread placement groups .	29 November 2017

Feature	API version	Description	Release date
H1 instances	2016-11-15	H1 instances are designed for high-performance big data workloads.	28 November 2017
M5 instances	2016-11-15	M5 instances are general purpose compute instances. They provide a balance of compute, memory, storage, and network resources.	28 November 2017
Spot Instance hibernation	2016-11-15	The Spot service can hibernate Spot Instances in the event of an interruption. For more information, see Hibernate interrupted Spot Instances .	28 November 2017
Spot Fleet target tracking	2016-11-15	You can set up target tracking scaling policies for your Spot Fleet. For more information, see Scale Spot Fleet using a target tracking policy .	17 November 2017
Spot Fleet integrates with Elastic Load Balancing	2016-11-15	You can attach one or more load balancers to a Spot Fleet.	10 November 2017
X1e instances	2016-11-15	X1e instances are ideally suited for high-performance databases, in-memory databases, and other memory-intensive enterprise applications.	28 November 2017
C5 instances	2016-11-15	C5 instances are designed for compute-heavy applications.	6 November 2017

Feature	API version	Description	Release date
Merge and split Convertible Reserved Instances	2016-11-15	You can exchange (merge) two or more Convertible Reserved Instances for a new Convertible Reserved Instance. You can also use the modification process to split a Convertible Reserved Instance into smaller reservations. For more information, see Exchange Convertible Reserved Instances .	6 November 2017
P3 instances	2016-11-15	P3 instances are compute-optimized GPU instances.	25 October 2017
Modify VPC tenancy	2016-11-15	You can change the instance tenancy attribute of a VPC from dedicated to default. For more information, see Change the tenancy of a VPC .	16 October 2017
Stop on interruption	2016-11-15	You can specify whether Amazon EC2 should stop or terminate Spot Instances when they are interrupted. For more information, see Interruption behavior .	18 September 2017
Tag NAT gateways	2016-11-15	You can tag your NAT gateway. For more information, see Tag your resources .	7 September 2017
Security group rule descriptions	2016-11-15	You can add descriptions to your security group rules. For more information, see Security group rules .	31 August 2017
Elastic Graphics	2016-11-15	Attach Elastic Graphics accelerators to your instances to accelerate the graphics performance of your applications. For more information, see Amazon Elastic Graphics .	29 August 2017

Feature	API version	Description	Release date
Recover Elastic IP addresses	2016-11-15	If you release an Elastic IP address for use in a VPC, you might be able to recover it. For more information, see Recover an Elastic IP address .	11 August 2017
Tag Spot Fleet instances	2016-11-15	You can configure your Spot Fleet to automatically tag the instances that it launches.	24 July 2017
G3 instances	2016-11-15	G3 instances provide a cost-effective, high-performance platform for graphics applications using DirectX or OpenGL. G3 instances also provide NVIDIA GRID Virtual Workstation features, supporting 4 monitors with resolutions up to 4096x2160.	13 July 2017
Tag resources during creation	2016-11-15	You can apply tags to instances and volumes during creation. For more information, see Tag your resources . In addition, you can use tag-based resource-level permissions to control the tags that are applied. For more information see, Grant permission to tag resources during creation .	28 March 2017
I3 instances	2016-11-15	I3 instances are storage optimized instances.	23 February 2017
Perform modifications on attached EBS volumes	2016-11-15	With most EBS volumes attached to most EC2 instances, you can modify volume size, type, and IOPS without detaching the volume or stopping the instance.	13 February 2017
Attach an IAM role	2016-11-15	You can attach, detach, or replace an IAM role for an existing instance. For more information, see IAM roles for Amazon EC2 .	9 February 2017

Feature	API version	Description	Release date
Dedicated Spot Instances	2016-11-15	You can run Spot Instances on single-tenant hardware in a virtual private cloud (VPC). For more information, see Specify a tenancy for your Spot Instances .	19 January 2017
IPv6 support	2016-11-15	You can associate an IPv6 CIDR with your VPC and subnets, and assign IPv6 addresses to instances in your VPC. For more information, see Amazon EC2 instance IP addressing .	1 December 2016
R4 instances	2016-09-15	R4 instances are memory optimized instances. R4 instances are well-suited for memory-intensive, latency-sensitive workloads such as business intelligence (BI), data mining and analysis, in-memory databases, distributed web scale in-memory caching, and applications performance real-time processing of unstructured big data.	30 November 2016
New t2.xlarge and t2.2xlarge instance types	2016-09-15	T2 instances are designed to provide moderate base performance and the capability to burst to significantly higher performance as required by your workload. They are intended for applications that need responsiveness, high performance for limited periods of time, and a low cost. For more information, see Burstable performance instances .	30 November 2016
P2 instances	2016-09-15	P2 instances use NVIDIA Tesla K80 GPUs and are designed for general purpose GPU computing using the CUDA or OpenCL programming models.	29 September 2016

Feature	API version	Description	Release date
m4.16xlarge instances	2016-04-01	Expands the range of the general-purpose M4 family with the introduction of m4.16xlarge instances, with 64 vCPUs and 256 GiB of RAM.	6 September 2016
Automatic scaling for Spot Fleet		You can now set up scaling policies for your Spot Fleet. For more information, see Automatic scaling for Spot Fleet .	1 September 2016
Elastic Network Adapter (ENA)	2016-04-01	You can now use ENA for enhanced networking. For more information, see Enhanced networking support .	28 June 2016
Enhanced support for viewing and modifying longer IDs	2016-04-01	You can now view and modify longer ID settings for other IAM users, IAM roles, or the root user. For more information, see Resource IDs .	23 June 2016
Copy encrypted Amazon EBS snapshots between AWS accounts	2016-04-01	You can now copy encrypted EBS snapshots between AWS accounts.	21 June 2016
Capture a screenshot of an instance console	2015-10-01	You can now obtain additional information when debugging instances that are unreachable. For more information, see Capture a screenshot of an unreachable instance .	24 May 2016
X1 instances	2015-10-01	Memory-optimized instances designed for running in-memory databases, big data processing engines, and high performance computing (HPC) applications.	18 May 2016
Two new EBS volume types	2015-10-01	You can now create Throughput Optimized HDD (st1) and Cold HDD (sc1) volumes.	19 April 2016

Feature	API version	Description	Release date
Added new NetworkPacketsIn and NetworkPacketsOut metrics for Amazon EC2		Added new NetworkPacketsIn and NetworkPacketsOut metrics for Amazon EC2. For more information, see Instance metrics .	23 March 2016
CloudWatch metrics for Spot Fleet		You can now get CloudWatch metrics for your Spot Fleet. For more information, see CloudWatch metrics for Spot Fleet .	21 March 2016
Scheduled Instances	2015-10-01	Scheduled Reserved Instances (Scheduled Instances) enable you to purchase capacity reservations that recur on a daily, weekly, or monthly basis, with a specified start time and duration.	13 January 2016
Longer resource IDs	2015-10-01	We're gradually introducing longer length IDs for some Amazon EC2 and Amazon EBS resource types. During the opt-in period, you can enable the longer ID format for supported resource types. For more information, see Resource IDs .	13 January 2016
ClassicLink DNS support	2015-10-01	You can enable ClassicLink DNS support for your VPC so that DNS hostnames that are addressed between linked EC2-Classic instances and instances in the VPC resolve to private IP addresses and not public IP addresses.	11 January 2016

Feature	API version	Description	Release date
New t2.nano instance type	2015-10-01	T2 instances are designed to provide moderate base performance and the capability to burst to significantly higher performance as required by your workload. They are intended for applications that need responsiveness, high performance for limited periods of time, and a low cost. For more information, see Burstable performance instances .	15 December 2015
Dedicated hosts	2015-10-01	An Amazon EC2 Dedicated host is a physical server with instance capacity dedicated for your use. For more information, see Dedicated Hosts .	23 November 2015
Spot Instance duration	2015-10-01	You can now specify a duration for your Spot Instances. Spot blocks is not supported (January 2023).	6 October 2015
Spot Fleet modify request	2015-10-01	You can now modify the target capacity of your Spot Fleet request. For more information, see Modify a Spot Fleet request .	29 September 2015
Spot Fleet diversified allocation strategy	2015-04-15	You can now allocate Spot Instances in multiple Spot pools using a single Spot Fleet request. For more information, see Allocation strategies for Spot Instances .	15 September 2015
Spot Fleet instance weighting	2015-04-15	You can now define the capacity units that each instance type contributes to your application's performance, and adjust the amount you are willing to pay for Spot Instances for each Spot pool accordingly. For more information, see Spot Fleet instance weighting .	31 August 2015

Feature	API version	Description	Release date
New reboot alarm action and new IAM role for use with alarm actions		Added the reboot alarm action and new IAM role for use with alarm actions. For more information, see Create alarms that stop, terminate, reboot, or recover an instance .	23 July 2015
New t2.large instance type		T2 instances are designed to provide moderate base performance and the capability to burst to significantly higher performance as required by your workload. They are intended for applications that need responsiveness, high performance for limited periods of time, and a low cost. For more information, see Burstable performance instances .	16 June 2015
M4 instances		General-purpose instances that provide a balance of compute, memory, and network resources. M4 instances are powered by a custom Intel 2.4 GHz Intel® Xeon® E5 2676v3 (Haswell) processor with AVX2.	11 June 2015
Spot Fleets	2015-04-15	You can manage a collection, or fleet, of Spot Instances instead of managing separate Spot Instance requests. For more information, see Spot Fleet .	18 May 2015
Migrate Elastic IP addresses to EC2-Classic	2015-04-15	You can migrate an Elastic IP address that you've allocated for use in EC2-Classic to be used in a VPC..	15 May 2015
Importing VMs with multiple disks as AMIs	2015-03-01	The VM Import process now supports importing VMs with multiple disks as AMIs. For more information, see Importing a VM as an Image Using VM Import/Export in the VM Import/Export User Guide .	23 April 2015

Feature	API version	Description	Release date
New g2.8xlarge instance type		The new g2.8xlarge instance is backed by four high-performance NVIDIA GPUs, making it well suited for GPU compute workloads including large scale rendering, transcoding, machine learning, and other server-side workloads that require massive parallel processing power.	7 April 2015
D2 instances		Dense-storage instances that are optimized for applications requiring sequential access to large amount of data on direct attached instance storage. D2 instances are designed to offer best price/performance in the dense-storage family. Powered by 2.4 GHz Intel® Xeon® E5 2676v3 (Haswell) processors, D2 instances improve on HS1 instances by providing additional compute power, more memory, and Enhanced Networking. In addition, D2 instances are available in four instance sizes with 6TB, 12TB, 24TB, and 48TB storage options.	24 March 2015
Systems Manager		Systems Manager enables you to configure and manage your EC2 instances.	17 February 2015
Systems Manager for Microsoft SCVMM 1.5		You can now use Systems Manager for Microsoft SCVMM to launch an instance and to import a VM from SCVMM to Amazon EC2. For more information, see Create an EC2 Instance and Import your virtual machine .	21 January 2015

Feature	API version	Description	Release date
Automatic recovery for EC2 instances		<p>You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically recovers the instance if it becomes impaired due to an underlying hardware failure or a problem that requires AWS involvement to repair. A recovered instance is identical to the original instance, including the instance ID, IP addresses, and all instance metadata.</p> <p>For more information, see Recover your instance.</p>	12 January 2015
C4 instances		<p>Next-generation compute-optimized instances that provide very high CPU performance at an economical price. C4 instances are based on custom 2.9 GHz Intel® Xeon® E5-2666 v3 (Haswell) processors. With additional Turbo boost, the processor clock speed in C4 instances can reach as high as 3.5Ghz with 1 or 2 core turbo. Expanding on the capabilities of C3 compute-optimized instances, C4 instances offer customers the highest processor performance among EC2 instances. These instances are ideally suited for high-traffic web applications, ad serving, batch processing, video encoding, distributed analytics, high-energy physics, genome analysis, and computational fluid dynamics.</p>	11 January 2015

Feature	API version	Description	Release date
ClassicLink	2014-10-01	ClassicLink enables you to link your EC2-Classic instance to a VPC in your account. You can associate VPC security groups with the EC2-Classic instance, enabling communication between your EC2-Classic instance and instances in your VPC using private IP addresses.	7 January 2015
Spot Instance termination notices		<p>The best way to protect against Spot Instance interruption is to architect your application to be fault tolerant. In addition, you can take advantage of Spot Instance termination notices, which provide a two-minute warning before Amazon EC2 must terminate your Spot Instance.</p> <p>For more information, see Spot Instance interruption notices.</p>	5 January 2015
Systems Manager for Microsoft SCVMM		Systems Manager for Microsoft SCVMM provides a simple, easy-to-use interface for managing AWS resources, such as EC2 instances, from Microsoft SCVMM. For more information, see AWS Systems Manager for Microsoft System Center VMM .	29 October 2014
DescribeVolumes pagination support	2014-09-01	<p>The <code>DescribeVolumes</code> API call now supports the pagination of results with the <code>MaxResults</code> and <code>NextToken</code> parameters.</p> <p>For more information, see DescribeVolumes in the <i>Amazon EC2 API Reference</i>.</p>	23 October 2014

Feature	API version	Description	Release date
Added support for Amazon CloudWatch Logs		You can use Amazon CloudWatch Logs to monitor, store, and access your system, application, and custom log files from your instances or other sources. You can then retrieve the associated log data from CloudWatch Logs using the Amazon CloudWatch console, the CloudWatch Logs commands in the AWS CLI, or the CloudWatch Logs SDK.	10 July 2014
T2 instances	2014-06-15	T2 instances are designed to provide moderate base performance and the capability to burst to significantly higher performance as required by your workload. They are intended for applications that need responsiveness, high performance for limited periods of time, and a low cost. For more information, see Burstable performance instances .	30 June 2014
New EC2 Service Limits page		Use the EC2 Service Limits page in the Amazon EC2 console to view the current limits for resources provided by Amazon EC2 and Amazon VPC, on a per-region basis.	19 June 2014
Amazon EBS General Purpose SSD Volumes	2014-05-01	General Purpose SSD volumes offer cost-effective storage that is ideal for a broad range of workloads. These volumes deliver single-digit millisecond latencies, the ability to burst to 3,000 IOPS for extended periods of time, and a base performance of 3 IOPS/GiB. General Purpose SSD volumes can range in size from 1 GiB to 1 TiB.	16 June 2014

Feature	API version	Description	Release date
Windows Server 2012 R2		AMIs for Windows Server 2012 R2 use the new AWS PV drivers. For more information, see AWS PV drivers .	3 June 2014
AWS Management Pack		AWS Management Pack now supports for System Center Operations Manager 2012 R2.	22 May 2014
Amazon EBS encryption	2014-05-01	Amazon EBS encryption offers seamless encryption of EBS data volumes and snapshots, eliminating the need to build and maintain a secure key management infrastructure. EBS encryption enables data at rest security by encrypting your data using AWS managed keys. The encryption occurs on the servers that host EC2 instances, providing encryption of data as it moves between EC2 instances and EBS storage.	21 May 2014
R3 instances	2014-02-01	<p>Memory-optimized instances with the best price point per GiB of RAM and high performance. These instances are ideally suited for relational and NoSQL databases, in-memory analytics solutions, scientific computing, and other memory-intensive applications that can benefit from the high memory per vCPU, high compute performance, and enhanced networking capabilities of R3 instances.</p> <p>For detailed instance type specifications, see Specifications in the <i>Amazon EC2 Instance Types Guide</i>. For pricing information, see Amazon EC2 On-Demand Pricing.</p>	9 April 2014

Feature	API version	Description	Release date
Amazon EC2 Usage Reports		Amazon EC2 Usage Reports is a set of reports that shows cost and usage data of your usage of EC2. For more information, see Amazon EC2 usage reports .	28 January 2014
Additional M3 instances	2013-10-15	The M3 instance sizes m3.medium and m3.large are now supported. For detailed instance type specifications, see Specifications in the <i>Amazon EC2 Instance Types Guide</i> . For pricing information, see Amazon EC2 On-Demand Pricing .	20 January 2014
I2 instances	2013-10-15	These instances provide very high IOPS. I2 instances also support enhanced networking that delivers improved inter-instance latencies, lower network jitter, and significantly higher packet per second (PPS) performance.	19 December 2013
Updated M3 instances	2013-10-15	The M3 instance sizes, m3.xlarge and m3.2xlarge now support instance store with SSD volumes.	19 December 2013
Resource-level permissions for RunInstances	2013-10-15	You can now create policies in AWS Identity and Access Management to control resource-level permissions for the Amazon EC2 RunInstances API action. For more information and example policies, see Identity and access management for Amazon EC2 .	20 November 2013

Feature	API version	Description	Release date
C3 instances	2013-10-15	<p>Compute-optimized instances that provide very high CPU performance at an economical price. C3 instances also support enhanced networking that delivers improved inter-instance latencies, lower network jitter, and significantly higher packet per second (PPS) performance. These instances are ideally suited for high-traffic web applications, ad serving, batch processing, video encoding, distributed analytics, high-energy physics, genome analysis, and computational fluid dynamics.</p> <p>For detailed instance type specifications, see Specifications in the <i>Amazon EC2 Instance Types Guide</i>. For pricing information, see Amazon EC2 On-Demand Pricing.</p>	14 November 2013
Launching an instance from the AWS Marketplace		<p>You can now launch an instance from the AWS Marketplace using the Amazon EC2 launch wizard. For more information, see Launch an AWS Marketplace instance.</p>	11 November 2013
G2 instances	2013-10-01	<p>These instances are ideally suited for video creation services, 3D visualizations, streaming graphics-intensive applications, and other server-side workloads requiring massive parallel processing power.</p>	4 November 2013
New launch wizard		<p>There is a new and redesigned EC2 launch wizard. For more information, see Launch an instance using the old launch instance wizard.</p>	10 October 2013

Feature	API version	Description	Release date
Modifying Amazon EC2 Reserved Instances	2013-08-15	You can now modify Reserved Instances in a Region.	11 September 2013
Assigning a public IP address	2013-07-15	You can now assign a public IP address when you launch an instance in a VPC. For more information, see Assign a public IPv4 address during instance launch .	20 August 2013
Granting resource-level permissions	2013-06-15	Amazon EC2 supports new Amazon Resource Names (ARNs) and condition keys. For more information, see IAM policies for Amazon EC2 .	8 July 2013
Incremental Snapshot Copies	2013-02-01	You can now perform incremental snapshot copies.	11 June 2013
AWS Management Pack		The AWS Management Pack links Amazon EC2 instances and the Windows or Linux operating systems running inside them. The AWS Management Pack is an extension to Microsoft System Center Operations Manager.	8 May 2013
New Tags page		There is a new Tags page in the Amazon EC2 console. For more information, see Tag your Amazon EC2 resources .	04 April 2013
Additional EBS-optimized instance types	2013-02-01	The following instance types can now be launched as EBS-optimized instances: c1.xlarge , m2.2xlarge , m3.xlarge , and m3.2xlarge .	19 March 2013
PV Drivers		To learn how to upgrade the paravirtualized (PV) drivers on your Windows AMI, see Upgrade PV drivers on Windows instances .	March 2013

Feature	API version	Description	Release date
Copy an AMI from one Region to another	2013-02-01	<p>You can copy an AMI from one Region to another, enabling you to launch consistent instances in more than one AWS Region quickly and easily.</p> <p>For more information, see Copy an AMI.</p>	11 March 2013
Launch instances into a default VPC	2013-02-01	<p>Your AWS account is capable of launching instances into either EC2-Classic or a VPC, or only into a VPC, on a region-by-region basis. If you can launch instances only into a VPC, we create a default VPC for you. When you launch an instance, we launch it into your default VPC, unless you create a nondefault VPC and specify it when you launch the instance.</p>	11 March 2013
High-memory cluster (cr1.8xlarge) instance type	2012-12-01	<p>Have large amounts of memory coupled with high CPU and network performance. These instances are well suited for in-memory analytics, graph analysis, and scientific computing applications.</p>	21 January 2013
High storage (hs1.8xlarge) instance type	2012-12-01	<p>High storage instances provide very high storage density and high sequential read and write performance per instance. They are well-suited for data warehousing, Hadoop/Ma pReduce, and parallel file systems.</p>	20 December 2012
EBS snapshot copy	2012-12-01	<p>You can use snapshot copies to create backups of data, to create new Amazon EBS volumes, or to create Amazon Machine Images (AMIs).</p>	17 December 2012

Feature	API version	Description	Release date
Updated EBS metrics and status checks for Provisioned IOPS SSD volumes	2012-10-01	Updated the EBS metrics to include two new metrics for Provisioned IOPS SSD volumes. Also added new status checks for Provisioned IOPS SSD volumes.	20 November 2012

Feature	API version	Description	Release date
Support for Windows Server 2012		<p>Amazon EC2 now provides you with several pre-configured Windows Server 2012 AMIs. These AMIs are immediately available for use in every region and for every 64-bit instance type. The AMIs support the following languages:</p> <ul style="list-style-type: none"> • English • Chinese Simplified • Chinese Traditional • Chinese Traditional Hong Kong • Japanese • Korean • Portuguese • Portuguese Brazil • Czech • Dutch • French • German • Hungarian • Italian • 	19 November 2012

Feature	API version	Description	Release date
		<p>Polish</p> <ul style="list-style-type: none"> • Russian • Spanish • Swedish • Turkish 	
M3 instances	2012-10-01	<p>There are new M3 extra-large and M3 double-extra-large instance types. For detailed instance type specifications, see Specifications in the <i>Amazon EC2 Instance Types Guide</i>. For pricing information, see Amazon EC2 On-Demand Pricing.</p>	31 October 2012
Spot Instance request status	2012-10-01	<p>Spot Instance request status makes it easy to determine the state of your Spot requests.</p>	14 October 2012
Amazon EC2 Reserved Instance Marketplace	2012-08-15	<p>The Reserved Instance Marketplace matches sellers who have Amazon EC2 Reserved Instances that they no longer need with buyers who are looking to purchase additional capacity. Reserved Instances bought and sold through the Reserved Instance Marketplace work like any other Reserved Instances, except that they can have less than a full standard term remaining and can be sold at different prices.</p>	11 September 2012

Feature	API version	Description	Release date
Provisioned IOPS SSD for Amazon EBS	2012-07-20	Provisioned IOPS SSD volumes deliver predictable, high performance for I/O intensive workloads, such as database applications, that rely on consistent and fast response times.	31 July 2012
High I/O instances for Amazon EC2	2012-06-15	High I/O instances provides very high, low latency, disk I/O performance using SSD-based local instance storage.	18 July 2012
IAM roles on Amazon EC2 instances	2012-06-01	<p>IAM roles for Amazon EC2 provide:</p> <ul style="list-style-type: none"> • AWS access keys for applications running on Amazon EC2 instances. • Automatic rotation of the AWS access keys on the Amazon EC2 instance. • Granular permissions for applications running on Amazon EC2 instances that make requests to your AWS services. 	11 June 2012

Feature	API version	Description	Release date
Spot Instance features that make it easier to get started and handle the potential of interruption.		<p>You can now manage your Spot Instances as follows:</p> <ul style="list-style-type: none"> • Specify the amount you are willing to pay for Spot Instances using Auto Scaling launch configurations, and set up a schedule for specifying the amount you are willing to pay for Spot Instances. For more information, see Launching Spot Instances in Your Auto Scaling Group in the <i>Amazon EC2 Auto Scaling User Guide</i>. • Get notifications when instances are launched or terminated. • Use AWS CloudFormation templates to launch Spot Instances in a stack with AWS resources. 	7 June 2012
EC2 instance export and timestamps for status checks for Amazon EC2	2012-05-01	<p>Added support for exporting Windows Server instances that you originally imported into EC2.</p> <p>Added support for timestamps on instance status and system status to indicate the date and time that a status check failed.</p>	25 May 2012
EC2 instance export, and timestamps in instance and system status checks for Amazon VPC	2012-05-01	<p>Added support for EC2 instance export to Citrix Xen, Microsoft Hyper-V, and VMware vSphere.</p> <p>Added support for timestamps in instance and system status checks.</p>	25 May 2012

Feature	API version	Description	Release date
Cluster Compute Eight Extra Large instances	2012-04-01	Added support for cc2.8xlarge instances in a VPC.	26 April 2012
AWS Marketplace AMIs	2012-04-01	Added support for AWS Marketplace AMIs.	19 April 2012
Medium instances, support for 64-bit on all AMIs	2011-12-15	Added support for a new instance type and 64-bit information.	7 March 2012
Reserved Instance pricing tiers	2011-12-15	Added a new section discussing how to take advantage of the discount pricing that is built into the Reserved Instance pricing tiers.	5 March 2012
Elastic Network Interfaces (ENIs) for EC2 instances in Amazon Virtual Private Cloud	2011-12-01	Added new section about elastic network interfaces (ENIs) for EC2 instances in a VPC. For more information, see Elastic network interfaces .	21 December 2011
New offering types for Amazon EC2 Reserved Instances	2011-11-01	You can choose from a variety of Reserved Instance offerings that address your projected use of the instance.	01 December 2011
Amazon EC2 instance status	2011-11-01	You can view additional details about the status of your instances, including scheduled events planned by AWS that might have an impact on your instances. These operational activities include instance reboots required to apply software updates or security patches, or instance retirements required where there are hardware issues. For more information, see Monitor the status of your instances .	16 November 2011

Feature	API version	Description	Release date
Amazon EC2 Cluster Compute Instance Type		Added support for Cluster Compute Eight Extra Large (cc2.8xlarge) to Amazon EC2.	14 November 2011
Spot Instances in Amazon VPC	2011-07-15	Added information about the support for Spot Instances in Amazon VPC. With this update, users can launch Spot Instances a virtual private cloud (VPC). By launching Spot Instances in a VPC, users of Spot Instances can enjoy the benefits of Amazon VPC.	11 October 2011
Simplified VM import process for users of the CLI tools	2011-07-15	The VM Import process is simplified with the enhanced functionality of <code>ImportInstance</code> and <code>ImportVolume</code> , which now will perform the upload of the images into Amazon EC2 after creating the import task. In addition, with the introduction of <code>ResumeImport</code> , users can restart an incomplete upload at the point the task stopped.	15 September 2011
Support for importing in VHD file format		VM Import can now import virtual machine image files in VHD format. The VHD file format is compatible with the Citrix Xen and Microsoft Hyper-V virtualization platforms. With this release, VM Import now supports RAW, VHD and VMDK (VMware ESX-compatible) image formats. For more information, see the VM Import/Export User Guide .	24 August 2011
Support for Windows Server 2003 R2		VM Import now supports Windows Server 2003 (R2). With this release, VM Import supports all versions of Windows Server supported by Amazon EC2.	24 August 2011

Feature	API version	Description	Release date
Update to the Amazon EC2 VM Import Connector for VMware vCenter		Added information about the 1.1 version of the Amazon EC2 VM Import Connector for VMware vCenter virtual appliance (Connector). This update includes proxy support for Internet access, better error handling, improved task progress bar accuracy, and several bug fixes.	27 June 2011
Spot Instances Availability Zone pricing changes	2011-05-15	Added information about the Spot Instances Availability Zone pricing feature. In this release, we've added new Availability Zone pricing options as part of the information returned when you query for Spot Instance requests and Spot price history. These additions make it easier to determine the price required to launch a Spot Instance into a particular Availability Zone.	26 May 2011
AWS Identity and Access Management		Added information about AWS Identity and Access Management (IAM), which enables users to specify which Amazon EC2 actions a user can use with Amazon EC2 resources in general. For more information, see Identity and access management for Amazon EC2 .	26 April 2011

Feature	API version	Description	Release date
Dedicated instances		<p>Launched within your Amazon Virtual Private Cloud (Amazon VPC), Dedicated Instances are instances that are physically isolated at the host hardware level. Dedicated Instances let you take advantage of Amazon VPC and the AWS cloud, with benefits including on-demand elastic provisioning and pay only for what you use, while isolating your Amazon EC2 compute instances at the hardware level. For more information, see Dedicated Instances.</p>	27 March 2011
Reserved Instances updates to the AWS Management Console		<p>Updates to the AWS Management Console make it easier for users to view their Reserved Instances and purchase additional Reserved Instances, including Dedicated Reserved Instances.</p>	27 March 2011
Support for Windows Server 2008 R2		<p>Amazon EC2 now provides you with several pre-configured Windows Server 2008 R2 AMIs. These AMIs are immediately available for use in every region and in most 64-bit instance types, excluding t1.micro and HPC families. The AMIs will support multiple languages.</p>	15 March 2011
Metadata information	2011-01-01	<p>Added information about metadata to reflect changes in the 2011-01-01 release. For more information, see Instance metadata and user data and Instance metadata categories.</p>	11 March 2011

Feature	API version	Description	Release date
Amazon EC2 VM Import Connector for VMware vCenter		Added information about the Amazon EC2 VM Import Connector for VMware vCenter virtual appliance (Connector). The Connector is a plug-in for VMware vCenter that integrates with VMware vSphere Client and provides a graphical user interface that you can use to import your VMware virtual machines to Amazon EC2.	3 March 2011
Force volume detachment		You can now use the AWS Management Console to force the detachment of an Amazon EBS volume from an instance.	23 February 2011
Instance termination protection		You can now use the AWS Management Console to prevent an instance from being terminated. For more information, see Enable termination protection .	23 February 2011
VM Import	2010-11-15	Added information about VM Import, which allows you to import a virtual machine or volume into Amazon EC2. For more information, see the VM Import/Export User Guide .	15 December 2010
Basic monitoring for instances	2010-08-31	Added information about basic monitoring for EC2 instances.	12 December 2010
Filters and Tags	2010-08-31	Added information about listing, filtering, and tagging resources. For more information, see List and filter your resources and Tag your Amazon EC2 resources .	19 September 2010
Idempotent Instance Launch	2010-08-31	Added information about ensuring idempotency when running instances.	19 September 2010

Feature	API version	Description	Release date
